15. *Penalty for Obtaining Registration by False Representation.*—Any woman who wilfully procures or attempts to procure herself to be placed on the register of midwifery nurses by making or producing, or causing to be made or produced, any false or fraudulent declaration, certificate, or representation, either in writing or otherwise, and any person assisting her therein, shall be deemed guilty of a misdemeanour, and shall on conviction thereof, be liable to a fine not exceeding ten pounds, or to be imprisoned with or without hard labour for any term not exceeding three months.

16. *Penalty for Wilful Falsification of Register.*—Any person who wilfully makes or causes to be made any falsification in any matter relating to the register of midwifery nurses shall be deemed guilty of a misdemeanour, and shall be liable to a fine not exceeding twenty pounds, or to be imprisoned with or without hard labour for any term not exceeding six months.

17. *Prosecution of Offences.*—Any offence under this Act punishable on summary conviction may be prosecuted, and any fine under this Act recoverable on summary conviction may be recovered, in manner provided by the Summary Jurisdiction Acts; and all penalties shall be paid to the Treasurer of the General Medical Council, anything contained to the contrary in the Metropolitan Public Acts or any Act passed before the passing of these Acts notwithstanding.

18. *Appeal.*—Where any woman deems herself aggrieved by any order, conviction, judgment, or determination of, or by any matter or thing done under this Act by any court of summary jurisdiction, such woman may appeal therefrom to the Court of Quarter Sessions.

19. *Extent of Act.*—This Act shall not extend to Scotland or Ireland.

The University of Buda-Pesth, in response to an inquiry addressed to it by the Minister of Instruction, has expressed the opinion that women should be admitted to the classes in the medical and pharmaceutical faculties, and should be eligible for degrees in those subjects.

The bathing establishment at Kreuznach has been enlarged by the erection of Russian and Roman baths and of appliances for inhalation.

THE ASSOCIATION OF FELLOWS OF THE ROYAL COLLEGE OF SURGEONS, ENGLAND.

A MEETING of the Committee of the Association of Fellows of the Royal College of Surgeons, England, was held at 101, Harley Street on July 17th, 1895. The minutes of the last meeting were read and confirmed. Mr. PERCY DREN (honorary secretary) pointed out that two of the candidates supported by the Association had been successful at the election of members of the Council at the College on July 4th. A vote of thanks was unanimously passed to Mr. A. T. Norton for representing the Association at the election. The Honorary Secretary then read a correspondence with the Secretary of the Royal College of Surgeons, from which it appeared that the Committee of the Association of Fellows would wish that Clause 3 in the proposed Charters and By-laws of the College as altered should stand as follows:

That no alteration in the constitution or external relations of the College shall be effected without the body corporate being convened to discuss such proposed alteration.

The proceedings at the half-yearly meeting of the Fellows at the College were then discussed, and attention was drawn to the fact that the President abruptly declared the meeting closed without affording the Fellows an opportunity of discussing the business which appeared on the agenda. This appeared to the Committee to be of so much importance that the following resolution was proposed, seconded, and unanimously passed:

That the attention of the President and Council of the Royal College of Surgeons be drawn to the fact that the half-yearly meeting of the Fellows on the 4th instant was closed without any discussion being possible in respect to the business on the agenda, and that in the opinion of the Committee of the Association of Fellows such a mode of conducting these meetings would be destructive of the privileges conceded by the Council to the Fellows, and would render the meetings nugatory.

It was also agreed that a copy of the above resolution should be forwarded to the Secretary of the College, with the request that it should be laid before the Council at the next meeting.

It was determined that the annual meeting of the Association should take place in November, at or about the date fixed for the annual meeting of the Fellows and Members of the Royal College of Surgeons.

THE SOCIETY OF MEMBERS OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

As stated in the BRITISH MEDICAL JOURNAL of July 20th, the Council has appointed the same Committee which recently received a deputation of Fellows on the subject of the proposed changes in the charters to receive a deputation of Members with reference thereto. The deputation will attend to-day (Friday, 26th), and the following are the amendments to the charters which the Society of Members will advocate:

1. That no alterations in the constitution and external relations of the College shall be effected without the consent of the Corporation convened to discuss such alterations.

2. That a statutory annual general meeting be held of the Corporation, to which the Council shall present a report of its proceedings during the past year, together with a duly audited account of the income and expenditure of the College; this report must be submitted for the approval of the meeting, and formally adopted.

3. That the number of the Council be increased to thirty-two, and that eight of these shall be Members (who are not also Fellows), and shall be elected by the Members only.

4. Provided that no Member who has not been a Member for twenty years shall be eligible for a seat on the Council.

5. That the same by-laws and regulations which are at present in force for the election and admission of Fellows to the Council shall govern the election and admission of Members, the word "Member" being substituted for "Fellow" throughout.

6. That of the eight Members first elected on the Council two shall retire annually in rotation, commencing with those two who have received the lowest number of votes, but that those shall be immediately eligible for re-election; after the end of the fourth year, when the eight members first elected on the Council shall all have been retired, the two members to go out of office annually shall be those two who have been longest on the Council without re-election.

The deputation will further support the election of the President, as at present, from and by the enlarged Council.

The Committee of the Society regard the first three clauses as the essentials of their proposal; they bring forward the remainder, as the absence of any detailed scheme has on previous occasions been made a subject of complaint.

BRITISH MEDICAL JOURNAL REPORTS.

SPECIAL REPORT ON THE CONDITION OF THE
ALDERSHOT CAMP SEWAGE FARM.

By E. BAILEY DENTON, M.D., F.R.C.P.

In compliance with the request of the Editor of the *British Medical Journal* that I should examine the present condition of the Camp Sewage Farm at Aldershot, and report to him thereon, I visited it on July 16th, and carefully inspected it.

I desire to state prefatorily that the average population of the garrison tributary to the farm in question is about 15,000, with a daily water supply of between 600,000 and 700,000 gallons.

The camp is said to be sewered on the duplicate system—that is to say, the surface or storm waters are professedly conducted into the watercourses of the district, and the sewage only into the sewers. As in most other instances, however, perfect separation has not been effected, with the result that, during times of rain, the quantity of sewage discharged into the sewers is considerably more than the water supply.

The Camp Farm, which has been from time to time the subject of such a variety of comments in the House of Commons and in the press, was, I am informed, laid out by Mr. James Blackburn, a well-known advocate of sewage farming, in or about 1865, when the question of sewage treatment generally was nothing like so well understood as at the present time. It consists of 115 acres of free soil, most suitable for sewage treatment, 100 acres of which are actually sewaged. Mr. Blackburn paid no rent to the Government, and held the farm for a term of fourteen years, giving it up at Michaelmas, 1880. During his occupancy things were well managed, and there were no complaints.

In 1880 a Mr. Brown succeeded Mr. Blackburn, and was granted a lease until Michaelmas, 1894, staying on, however, as tenant at will until June of this year (1895). Mr. Brown paid the War Office a rent of £100 a year, and during the latter portion of his term things began to present a very different appearance to what they did in Mr. Blackburn's time.

In June of this year, in consequence of the frequent complaints publicly made against the farm, Lieutenant Colonel Jones, V.C., late of Wrexham, who has had much experience in sewage farming, was entrusted with its management by the War Office, who began to see that there was real ground for complaints; and he was instructed to apply such remedies as he thought proper in order, it may be presumed, to satisfy public opinion. As Colonel Jones has only been in residence for a few weeks, he naturally has not yet had an opportunity to do anything of a thoroughly practical character.

The appearance of the farm on the day of my inspection was the reverse of agreeable, for the systematic neglect of years is apparent at every turn. The homestead, which on a sewage farm should be an example of order and careful maintenance, especially in such a place as Aldershot, is next door to a ruin; and there is not a gate on the whole farm. The condition of the roads and fences likewise is very bad. The tanks at the outlets of the four outfall sewers, which were never of good design, and which are most unsuitable for the deposition of sludge, have fallen into decay, and having apparently never been cleaned out for a long time present a disgraceful appearance, the large quantities of sludge collected in them giving off nauseating odours. Much of the land is out of cultivation, and its surface has in many places lost the even level, or slope, to which it was apparently carefully reduced and maintained by Mr. Blackburn, with the result that the sewage collects in the low places, forming stagnant and offensive pools. The main furrows by which the sewage ought to be rapidly conveyed from the various tanks for distribution over the land have, from want of proper attention, become simply large and ill-shaped ditches, which serve to collect the sewage and obstruct its rapid conveyance to the various points of outlet. The smaller branch furrows have been equally neglected.

Not content with applying, or rather misapplying, the sewage to the land which he leased from the Government, the late tenant, presumably whenever he wished to do so, was allowed to convey the sewage to several low-lying meadows of his own beyond the sewage farm and in proximity to the river Blackwater. Here were the same evidences of careless management, and obviously the sewage had been allowed to flow as it pleased towards, and eventually into, the river, thus causing needless pollution of a serious character.

I have no hesitation in stating my belief that the recent outcry is not only perfectly justifiable, but that the present disgraceful state of things is entirely traceable to long and continued neglect. Upon whose shoulders the responsibility for this neglect lies is not within my province to inquire. It would almost look as if the War Office, after obtaining the large annual rent of £100 for 115 acres, had closed their eyes to everything else, for certainly it is that if the late tenant had been bound down by the ordinary rules inseparable from successful sewage farming, and had their due observance been systematically maintained, there would never have been cause for complaint.

I am convinced that even now if the farm throughout were properly laid out for the reception of sewage, the surface of the land carefully levelled and prepared, new tanks of modern and improved design built, and pipe conduits 1-ft. or small earthen carriers made, so that the liquid could be rapidly conveyed and distributed over the whole of the area, there would not be a better or more successful sewage farm in England, for it is seldom that such suitable soil is met with; whilst the area at command is sufficient to successfully purify the sewage of at least 40,000 people without the slightest nuisance.

The authorities should realise the exceedingly lamentable condition of things as soon as possible, and give the necessary money and instructions to immediately carry out what is required, for temporary or palliative measures will be of no avail.

The only alternative to such a course, but one which will involve a far greater outlay, is to remove the sewage farm to another site at a greater distance from the camp, one argument in favour of this alternative being that a new hospital may possibly be built on the adjacent high ground between the sewage farm and the Marlborough lines at a distance of about 250 yards from the nearest point to which the sewage is now applied; but whether the present farm is retained or a new one acquired, it is imperative that the authorities should settle the question without delay.

It having been suggested that the town of Aldershot and the camp should combine and take their sewage to a site near Gove Common, where a new and extensive sewage farm could be laid out, I visited the sewage disposal works of the town, where I was courteously received by Mr. Rushford, town surveyor, and given every information. I found that the sewage, which amounts to a daily quantity of about 650,000 gallons, was being treated satisfactory, and that after mixture with sulphate of alumina, and subsequent deposition in tanks, the liquid is conveyed to thirty-two acres, over which it is distributed. The effluent, which is discharged into the Blackwater after filtration through this land, was clear and good. The site, however, where the accumulated sludge, after being raised from the tanks, is deposited, is very near the town, and a nuisance must at times result. An improvement would be advisable, and the district council would do well to consider whether, as there appears to be available land in proximity to their thirty-two acres, at a greater distance from the town, to which the sludge could be raised (as may be seen by a visit to the farm of Mr. Booth at Lambrook), it is necessary, or even desirable, to join with the camp authorities in the larger scheme of total removal, which must necessarily involve all concerned in very great expenditure.

THE PEDIATRIC MONTHLY is the name of a new journal which will begin to appear at fortnightly intervals on January 1st, 1896. A specimen number will be issued in October next. As the name denotes, it will be devoted to the study of disease in infants and children. Dr. Dillon Brown, of New York, who at present edits the *Archives of Pediatrics* will be the Editor of the new journal, the annual subscription to which in this country it is intended to fix at 8s.

BRITISH MEDICAL ASSOCIATION. SUBSCRIPTIONS FOR 1895

Subscriptions to the Association for 1895 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches are requested to forward their remittances to the General Secretary, 429, Strand, London. Post-office Orders should be made payable at the General Post Office, London.

British Medical Journal.

SATURDAY, JULY 27TH, 1895.

FOOD-POISONING.

Cases of alleged food-poisoning occur constantly, but whether reported in the daily press or in a scientific journal, they are almost always unsatisfactory reading. This is due to the fact that in most instances an official report has to be drawn up on insufficient data or on an evidence most unsatisfactory in nature. Although Brieger's researches have been popularised to such an extent that "ptomaine" has almost become a household word, and although bacteriology has thrown much light on the nature of food poisoning, yet confusion is still great, and our means of prevention utterly inadequate. We shall not presume to suggest fresh measures, but shall venture to offer a few critical remarks with regard to some commoner errors often found in official reports of medical officers of health and others. A few notes published by Sir Charles Cameron in the last number of this JOURNAL contains at least one of these popular delusions. The writer alludes to the well-known Limerick Convent food-poisoning case. It is doubtful what the cause of the distressful symptoms was; Sir Charles Cameron thinks that it certainly could not have been the meat, "because some persons who had partaken of it were not ill." Here the reasoning may be at fault, for we know that the poison, supposing it to be a ptomaine, is not necessarily diffused throughout the whole substance of the meat, but may be collected at one or other part or parts. In the case of Lieutenant Huddleston, for instance, who died from ptomaine poisoning after partaking of tinned sardines, Dr. Stevenson clearly showed that a few of the sardines only were poisonous. Numerous cases all proving the same might be mentioned. The Limerick case was undoubtedly one of acute poisoning and not a bacterial infection, but the meat cannot be excluded, unless it can be clearly shown that some of the sufferers had not consumed any of it. It is a common error to argue from positive evidence alone. Thus Sir Charles Cameron argues that the poison must have been in a custard, because all who partook of it sickened. Whether this be so, and whether the poison was generated in the milk as tyrotoxin or in the egg, it is impossible to say, because there was nothing left for an analytical examination, and as usual there are no facts to go upon, and therefore criticism is useless. Certainly tyrotoxin is poisonous, and putrefying eggs contain toxic bodies: further we cannot go, for the evidence is too meagre. Thus if the poison really was in the

custard, we should like to know whether those who consumed much of it suffered more than those who were less tempted by what hardly appeared to be a tempting dish.

How these poisons arise in food is unknown; undoubtedly organisms gain access, and through some form or another of fermentation lead to the manufacture of ptomaines, but how they get there is purely a matter of conjecture. An amusing account is given in a special report on a case of food poisoning at Homerton. Here a family of nine, living in a badly-drained house, all suffered from acute poisoning after eating a meat pie which, after having been used hot on the Sunday, was consumed cold on Monday. The medical officer rightly argues that since symptoms came on soon after the meal, there was an intoxication and not an infection. The appearance of the poison in the pie is thus explained: "The baking of the pie led to the formation of a certain amount of gelatine, which is a most suitable nutrient medium for the growth of organisms. The foul odours from the drain were probably laden with harmful organisms, which multiplied in the pie and produced the poison." How comforting it must have been to find foul-smelling drains.

The number of food poisoning cases during the hot weather has again been great. Among the articles of food suspected in the various instances we may mention (a) tinned potted meat (27 persons suffered, with 1 death), (b) tinned tomatoes, (c) exposed meat (several fatal cases), (d) brawn (a common offender), (e) food kept for a few days. Most verdicts end with the clause, "But no blame was attached to anyone." This is just enough, so long as we are ignorant of the processes leading to the formation of ptomaines and other poisonous bodies. People, however, should realise the danger of eating any but fresh meat, especially during the hot season. Some of the "scraps" which butchers sell later in the day or later in the week are disgusting in appearance, and it does not seem right to tempt even the poorest to consume such stuff. Fishmongers also are not careful enough in their liberality towards the poor; a tainted fish is a dangerous gift. An adequate food inspection is a most difficult problem, but surely it is easy enough to put a stop to obvious errors by strict prohibition.

THE PHARMACY OF THE "BRITISH PHARMACOPOEIA."

For some years past Professor Attfield has been charged with the duty of reporting to the Pharmacopoeia Committee of the General Medical Council upon matters relating to the pharmaceutical improvement of the *Pharmacopoeia*, and the report presented by him during the late session of the Council has now been issued. Like the reports of previous years, it contains for the most part a summary of suggestions which have been published in the *Pharmaceutical Journal* and other papers as to various details considered, from the pharmaceutical point of view, to require notice in the revision of the *Pharmacopoeia*. As representing, in a connected form, the work done in that direction the report furnishes much useful information; and though the proposals made in some of the papers referred to in the report are not recommended for adoption, their mention may be regarded as proof that they deserve consideration. There are, however, several specific recommendations made by the reporter, and the one of chief importance relates to the

standardisation of Galenical preparations, so far as advanced knowledge of the therapeutic action of drugs and of the chemical nature of their constituents will admit of that being carried out in practice.

It is proposed that in regard to belladonna, hemlock, ipecacuanha, and some other drugs, definite standards shall be introduced into the new *Pharmacopœia* based on specified amounts of alkaloid or other active principles. The strength of Galenical preparations of these and other drugs is also to be adjusted in like manner. The object is that the directions given in the *Pharmacopœia* for making such preparations shall be sufficient to secure fairly constant proportions of the alkaloids or other active principles of the respective drugs, and uniform therapeutic value of their several preparations. With that object methods of assay are suggested as applicable for the purpose either to the drugs or to some preparations of them from which other preparations of definite strength can be obtained either by dilution or by other simple means. The endeavour, by such procedure, to ensure greater uniformity of medicinal preparations, especially those of considerable potency, may be regarded as an important step in advance of former practice. But such standardisation, as pointed out in the report, is not by any means a perfect process, either from a chemical or therapeutic point of view. The precise action of alkaloids and other active principles in a pure state and when associated with other substances, as is the case with many drugs in their natural state, is still too little known to admit of any particular constituents being regarded as the active principles of the respective drugs. If the contrary were the case, the analytical separation of alkaloids can rarely be carried out in such a manner that their individual amounts can be determined with precision. Very frequently the utmost that can be done is to ascertain the amount of total alkaloids, and owing to their varying relative proportions a constant percentage is not necessarily synonymous with an equal degree of medicinal potency. In *nuxvomica*, for instance, the relative proportions of strychnine and brucine are known to vary, but in default of a ready method of separation, standardisation on the basis of strychnine alone cannot be recommended. The analytical determination of total alkaloids may also be inaccurate in consequence of experimental errors. When alkaloids are extracted from drugs or separated from medicinal preparations by solution in ether or chloroform, the residue left on evaporating such a solution invariably contains some admixture of resin and colouring substances, etc., so that, taking its weight as the measure of the amount of alkaloid, the result arrived at will be too high. The methods suggested in the report for the purpose of standardising *Pharmacopœia* preparations are in some instances open to this objection; and they certainly admit of being improved by substituting titration with an acid for the weighing of residues which contain other substances besides the alkaloids to be determined.

Among other points of importance, mention is made of Dott's suggestion that the specific gravity of chloroform should be reduced, by the addition of alcohol, to 1490 or 1495, so as to make it more capable of being kept without decomposition. Improved definitions are also suggested in the case of carbolic acid, chrysarobin, saffron, liquid extract of ergot, podophyllin, resin, and other articles.

SIR JULIAN GOLDSMID has been elected Vice-Chancellor of the University of London.

THE members of the Northern Counties Branch of the British Medical Association presented Dr. Mackay, of Elgin, with his portrait on June 20th, in recognition of the valuable disinterested and unremitting services rendered by him as Secretary and Treasurer of the Branch from its inauguration in 1863. The portrait was painted by Sir Geo. Reid.

AMONG the medical men who have been returned to the new Parliament we notice the following: Dr. R. Ambrose (West Mayo), Dr. G. B. Clark (Caithness-shire), Dr. Robert Farquharson (West Aberdeenshire), Sir B. Walter Foster (Ilkeston, Derbyshire), and Dr. M. A. Macdonnell (Leix, Queen's County).

LOCAL ENTERTAINMENT AND EXCURSION COMMITTEE.

IN consequence of the unavoidable absence of Dr. R. Boxall, it is requested that all future communications referring to the entertainments and excursions be addressed to Dr. Symons Eccles, 28, Hertford Street, Mayfair, W.

THE LONDON HOSPITALS AND THE APPROACHING ANNUAL MEETING.

ST. THOMAS'S HOSPITAL is to be added to the hospitals in London mentioned last week which propose to offer special opportunities to members attending the annual meeting of the British Medical Association in London. On Thursday, August 1st, from 3 to 6 P.M., a series of interesting cases will be exhibited and demonstrated by the members of the medical staff, and a garden party will be given at the same time, to which all members of the Association, together with ladies accompanying them, are invited.

THE VICTORIA CROSS.

DR. R. E. BURGESS (Chester) writes to us: In the *BRITISH MEDICAL JOURNAL* of July 20th, page 158, I see a notice of the Victoria Cross having been granted to Surgeon-Captain Whitechurch by Her Majesty, and afterwards there is a list given of those medical officers who have been awarded the distinction. I would beg to call your attention to the fact that Surgeon William Bradshaw was awarded the Victoria Cross for bravery at the same time as Surgeon-General Home, but he unfortunately did not live to have the distinction actually conferred on him. In the Victoria Cross Gallery is to be seen the picture of Surgeons Home and Bradshaw earning the V.C. I am inclined to think that when his portrait actually appears in the Victoria Cross Gallery Dr. Bradshaw's name ought not to be totally ignored as it is at present.

CLUBS AND FRIENDLY SOCIETIES IN THE SOUTH OF IRELAND.

OWING to the death of one of the medical men, Dr. O'Sullivan, who went to Cork to take up the appointments to the medical clubs and societies of that city rendered vacant by the resolve of the medical men in Cork no longer to accept the utterly inadequate remuneration offered by these bodies, the Oddfellows Society are finding it necessary to seek for a successor. We would remind medical men who may be approached with the view of accepting the appointment that, should they do so, they will be acting in opposition to the general opinion of the medical profession in the United Kingdom, as expressed by various representative bodies, and as further shown by the action taken by the medical profession resident in Inverness, Portsmouth, and other towns. The council of the Dublin Branch of the British Medical Association, when the action of the medical men in

Cork in resisting the demands of the clubs and societies in Cork was first made known, adopted a resolution expressing the hope that the medical men in Cork would "maintain a united front against the attempt of the said societies to impose unworthy and inadequate terms on their medical officers." The Council of the British Medical Association, at its meeting on January 10th, 1895, after hearing a deputation from the South of Ireland Branch, adopted unanimously a resolution condemning strongly "the admission of improper persons as members of medical aid societies," expressing their deep sympathy "with those medical men who have been compelled to resign their positions," and promising to render to them all the assistance in the power of the Council. The Irish Medical Association on February 20th, 1895, adopted a resolution expressing "its sympathy with the medical officers heretofore acting for clubs and benefit societies in their effort to resist the admission of persons with ample means to the benefit of such societies." Many of the Branches of the British Medical Association have adopted similar resolutions, and we venture to hope that these very significant expressions of opinion, and the very general movement within the profession to vindicate its right to determine the conditions upon which medical services should be rendered to clubs and similar organisations, and, in particular, to provide that a suitable wage limit should be enforced, will have the effect of deterring members of the profession from accepting appointments to clubs in which no such limit exists.

EDINBURGH CITY HOSPITAL FOR INFECTIOUS DISEASE.

AFTER all the supposed solution of the Edinburgh Fever Hospital difficulty has fallen through. At the Town Council meeting on July 23rd the Lord Provost announced that Sir Henry Littlejohn and Dr. Muirhead, the visiting physician, had reported on the proposed Craiglockhart site in very adverse terms. They could not recommend the site as one suitable for such a hospital as the requirements of Edinburgh demanded, the ground was too restricted in size, and the position faulty. In winter it was exposed to mists, and for several months had no direct sunshine. Surprise was expressed at the report, and some grumbling. Sir James Russell said he did not think they would get a single man of eminence or experience to recommend the site. The Lord Provost thought the report rather exaggerated. But by general agreement the matter dropped, and Edinburgh is still in need of a fever hospital. It cannot but be felt that much more vigorous effort should be used to secure this. The present hospital is admittedly, if not notoriously, unsatisfactory, inconvenient, and unsuitable.

DEAD MEN'S BROTH.

THE Rev. Harry Jones tells some excellent stories in his interesting little book of personal reminiscences, just published, called *Dead Leaves and Living Seeds*. Mr. Jones's work, both in the West and East End of London, brought him much in contact with medical men and medical matters, and—always a keen sanitarian—he used his influence to enforce practical sanitation among the poor. Speaking of the famous Broad Street pump and of the part it played in a cholera epidemic, he tells how the water of a certain pump, situated in the churchyard of St. George-in-the-East, was greatly appreciated by the people for its cool and sparkling character. There were rumours of cholera in the air, and Mr. Harry Jones tried in vain to dissuade his parishioners from filling their pails and jugs at the favourite churchyard pump till he hit upon the device of hanging a placard on the pump with this inscription, "Dead Men's Broth." This startling announcement was enough to make the water distasteful; and he says he used to watch the arrival of disobedient souls, who paused to read the notice and retired with empty buckets. Of the great visitation of cholera in 1893, Mr. Harry Jones

is able to give some more lively reminiscences than are usually told of this terrible time. He says that he thinks in the first panic some people must have been buried alive. In one case a neighbour obtained leave to rub the supposed dead corpse of Sarah B. with mustard. She was about to be carried off by the mortuary cart for burial, but sat up under this external stimulant; and Mr. Jones tersely adds that in subsequent years he baptised four of her children. In another case a more energetic stimulus was most effectual. A potman was seemingly *in articulo mortis* when his sister called in Dr. Joseph Rogers, who said he feared he could do nothing for the man, but would lay a towel dipped in spirits of wine down his spine. For this purpose he was laid on his face. It was night, and his sister held a candle. But the doctor had no sooner placed the soaked napkin on his back ready to be stretched along it, than she nervously set it alight. Upon this the patient sat up, and eventually recovered. These methods of treating cholera have not yet recommended themselves to the medical profession.

THE EVIDENCE BEFORE THE SCOTCH DEPARTMENTAL COMMITTEE ON INEBRIATES.

THE very full and valuable testimony adduced in support of further legislation for inebriates which was elicited by the Scottish Departmental Committee on Inebriates has just been issued by Neill and Co., Edinburgh. In this bulky volume of 676 pages (6s. 3d.), will be found a compendium of skilled opinion which amply warrants the thoroughgoing suggestions made by the Committee. The evidence in favour of compulsory therapeutic seclusion is so overwhelming as to render further legislation certain. Sooner or later inebriate offenders must be treated remedially as diseased persons, and non-criminal habitual drunkards brought under curative restraint voluntarily or involuntarily. Amongst some curious information given is that of the system of a money pledge often given in Glasgow police offices on recovering sobriety, which is forfeited if the person does not appear at the police court next morning. In 1893, 5,892 persons arrested out of 16,043 forfeited their pledge, the amount in one year being as large a sum as £12,000. The evidence of an American practitioner who is connected with a secret cure institution is as suggestive as it is amusing. Everyone interested in the treatment of inebriety should study this extended report of the minutes of the evidence.

MIDWIVES REGISTRATION AND THE ANNUAL MEETING.

WE published last week a notice of a meeting called by Dr. Rentoul and Dr. Hugh Woods requesting the attendance at a preliminary meeting of those who propose to support the resolution against the registration of midwives. Dr. Boxall and Mr. F. R. Humphreys, 27, Fellows Road, N.W., request us to publish a notice asking those who are in sympathy with the principle of registration of midwives to attend the general meeting of the Association in Exeter Hall on Tuesday, July 30th, at 2.30 P.M., to vote or to speak against the motion standing in the name of Mr. Lawson Tait, which will be taken in the discussion on the report of the Council of the Association produced at that meeting.

REGISTRATION OF MIDWIVES.

AN experienced coroner of a large district writes to us: Under the startling heading of "Child Murders in the East End," reports and articles have appeared in some of the daily newspapers, calling special attention to the numbers of newly-born children found dead in the streets and other places, usually wrapped up as parcels. During last year in the eastern district of London it is said that 102 inquests have been held on such children, and in the majority of these, after *post-mortem* examination, medical witnesses have stated that these children were born alive and died from suffocation at or soon after birth. It is often found that no skilled attendance could have been given to the child, the cord being often cut or torn across at varying

lengths from the abdomen, without any attempt at tying. It is very seldom that the parentage of these children is traced or the persons by whom they are disposed of known. A very strong suspicion, however, prevails in the mind of the coroners, the police, and the medical witnesses as well as the juries, that a large majority of such cases are the result of child murder; and from the very low class of women who practise in such localities under the title of "midwife," without any qualification to do so, beyond that which they themselves assume, it is not unreasonably surmised that many of these children are not permitted to live beyond a few minutes after birth, and then on the first favourable opportunity are quietly dropped as parcels in the streets or left under the seats of railway carriages, or placed within the railings of some square or enclosure. It is exceedingly difficult to trace these cases further, or to charge or apprehend even a suspected person, as long as the law remains in its present state. To quiet the public mind and to remove or verify the very strong suspicion that exists regarding the method of disposal of the life and bodies of these newly born children certain suggestions have been made; first, that the law regarding the registration of the birth of children should be more stringent, so that all births, including stillbirths, should be registered, and that it should not only be compulsory to parents, but to any other person present at the birth, to notify the same. Further, that midwives should be registered after proper examination, and should be compelled to notify the births of all children the mothers of whom they attend. If this were so, in course of time the class of women upon whom in these matters considerable suspicion rests would disappear, and with them we have reason to believe a large number of the suffocated, if not murdered, infants found dead under the circumstances we have already described would disappear also.

THE INDEX MEDICUS.

As will be seen by the correspondence between Mr. MacAlister, the librarian of the Royal Medical and Chirurgical Society, and Dr. Billings, the librarian of the Surgeon-General's Office at Washington, a determined effort is to be made to resume the publication of the *Index Medicus*. Of the value of this publication to all engaged in the study and interested in the advancement of medicine and the ancillary sciences, we have spoken recently. It is a guiding thread which leads the inquirer through the mazes of the literature of modern medicine. Without it, or some such guide, the attempt to find a reference, when the subject or author only is known, is almost as hopeless as looking for a needle in a bottle of hay. The subscription proposed is, it must be admitted, very high, but the production of such a serial is extremely costly, and there ought to be a sufficient number of libraries and societies alone in this country to supply a large proportion of the sixty subscribers required from us. The margin might probably be made up, as Mr. MacAlister suggests, by groups of medical men formed for the purpose of obtaining a copy in common. The suggestion to issue the *Index Medicus* in future quarterly instead of monthly will, we believe, meet with general approval, inasmuch as the value of the work would not be diminished to an appreciable extent by such an alteration.

INSUFFICIENT WATER AND DISEASE.

THE inefficient water supply of the East End of London has been again and again the subject of inquiry, and the supply of specifically tainted water has been the cause of more than one epidemic of disease. In a summer of unusual heat and prolonged drought the East London Waterworks Company have failed as completely to fulfil their contracts to give a constant supply of water as they did in the winter, when severe frost utterly paralysed their methods. In the winter want of water was bad enough; but in the summer it is a grave danger to the public health. Mr. Thomas Taylor, Medical Officer of Health Mile End Old Town, writes to a

contemporary: "Very numerous cases of diarrhoea have been reported to me, and I have no doubt that the fact of so little water flushing the house drains is a direct cause of this disease. Just now, when the accommodation for diphtheria patients at the Asylum Board's Hospitals is nearly exhausted, is not the time for lessening the water supply either for flushing effectually house drains and sewers or for ablation purposes. We shall be told by the water companies that every householder should provide storage cisterns. I should say, No; it is the very thing that we as sanitary experts set our face against, having too frequently seen the results of cisterns neglected to be cleansed." Householders have been complaining that the supply is shut off at 9 p.m., and that the pressure is so slight that the water cannot rise to the top of houses of the usual number of storeys; hence, lodgers in the upper storeys of model lodging houses have been suffering severely for want of water. The conditions produced by the lack of water for flushing of drains, etc., are largely conducive of disease. The complaints against the water company are bitter and well deserved. High rates are imposed on the water company's undertaking to give a constant water supply; the contract is broken, and ratepayers are justly beginning to argue that a contract broken cannot be enforced against one contracting party alone. The water company is pressing for the payment of rates for water not supplied, and East Enders are summoning the water company for breach of contract in not supplying water for which the rates are levied. The East Enders are in the right. The recent rainfall may fill the river Lee and the empty storage tanks, and public indignation may have its ardour damped, but this does not release the East London Waterworks Company from the necessity and the duty of storing water against the accidents of the English climate, and of fulfilling their contract to give a constant water supply in return for rates paid.

THE HYGIENE OF TRAVELLING.

A HYGIENIC conference of a new kind very appropriate to this age is to be held in Amsterdam on September 20th and 21st. It is designed to bring together medical men interested in sanitary questions affecting railways and ships. It will be divided into three sections, the first dealing with the provisions for ensuring the efficiency of the persons employed, the second with the organisation of the medical service, and the third with the protection of the health of the men employed and of the passengers. Railway companies will be invited to send delegates, and it is hoped that those from each country will draw up a memorandum on the regulations existing in their several countries. The Dutch delegates have already prepared such a memorandum. The Secretary of the Congress will be Dr. Pijnappel, Stadhouderskade 60, Amsterdam, from whom further information can be obtained. Professor H. Snellen is president of the Organising Committee. Special facilities will be given to the members for visiting the exhibition now open in Amsterdam. The official languages of the Congress will be French, English, and German.

CONDENSED "MILKS."

IN Dr. Gubb's interesting letter which we published in the *BRITISH MEDICAL JOURNAL* of July 20th on the condensing and sterilisation of milk, he points out the value of condensed milk in that he desired to call attention to the principle of using only sterilised milk. If this be desirable then no more satisfactory guarantee of sterility can be provided than by the process of condensation in which the cooking is not carried beyond the point at which sterilisation is ensured. There can be no doubt of the vast importance of the use for infant feeding of condensed milk and for the community at large of sterilised milk. Milk condensed under heat has for adult consumption the disadvantage of certain alterations in flavour which makes it unpopular as

an ordinary beverage, or for use with tea, and it is desirable that some means should be found for condensing and sterilising milk without the use of heat, or, at any rate, at such low temperatures that the essential quality and flavour of the milk shall not be altered. Meantime, there can be no doubt of the immense value of condensed milk in the present and ordinary acceptance of the term. But then it is highly desirable that it should really be condensed milk. That which is now sold in a great variety of brands as condensed milk has in a great majority of instances little or no title to that claim; it is, in fact, very largely condensed separated milk; that is to say, milk that has been wholly deprived of its cream, and which is altogether unfitted for the dietary of children or of adults if used to replace milk properly so-called. It will be seen that in the "Milkmaid" brand, which is taken as a standard, the proportion of cream is 10 to 12 per cent., which may be accepted as a good reliable standard, but in the majority of milks examined the amount of cream only showed an average of 0.72 per cent. Certainly there should be legislation to prevent this most dangerous and dishonest practice, which is a constant danger in the rearing of children and often a serious fraud. In respect to the best condensed milks, it is still very desirable that their condensation and sterilisation should be effected without employing the high temperatures now generally in use, which undoubtedly alter the physical conditions and quality, as well as affect the flavour and acceptability of the milk. We feel convinced that the means will before long be found of doing this, and thus effect what will be one of the most beneficent revolutions in modern dietetics.

SIR JOSEPH LISTER.

A COMMITTEE has been formed, with Mr. Davies-Colley (36, Harley Street) as Treasurer and Mr. Eilton Pollard (21, Harley Street) as Secretary, to present a portrait of Sir Joseph Lister to the Royal College of Surgeons of England, to be "placed by the side of the portraits of John Hunter and other great surgeons of the past." The Committee has selected Mr. W. W. Oulless, R.A., as the artist by whom the portrait is to be painted, and a certain amount of irritation, we are told, has been caused by the Committee having arrived at this decision without holding a meeting of intending subscribers. The Committee may not have been well-advised in this respect, but any such error of judgment will not, we feel sure, be allowed to weigh against the proposal they make. It will command the universal assent and support of all surgeons in this country who have a just perception of the enormous debt which surgery owes to the life-work of Sir Joseph Lister. If he were never again to make any contribution to the science and art which he has adorned, his record would place him in the very forefront. The proposition now made is an eminently proper recognition of a great surgeon by those of his own household. But this country will not be true to itself if it does not raise a national memorial to one of its greatest sons.

MEDICAL OFFICERS OF SCHOOLS' ASSOCIATION.

ON Thursday, July 16th, about a dozen members of this Association, including the President, Dr. Eustace Smith, journeyed to Baileybury College, at the invitation of the head master, the Hon. and Rev. E. Lyttelton, who is an honorary member of the Association. Arrived at the school they were received by Dr. Shelly and Dr. Horace Savory, the consulting and resident medical officers, as well as by some of the masters and the bursar. A visit was first paid to the kitchens and the dining hall, the arrival of the party being happily timed for the boys' dinner hour. Subsequently the whole of the school buildings and premises were inspected by the visitors, the chief scenes of interest being the water softening apparatus. The water is obtained from a well

some 200 feet deep in the chalk bed. The earth closets and earth sheds, the swimming bath (a large open-air bath which was in full working order), the laundry (likewise fully occupied), the sick house and the new sanatorium (a separate building capable of isolating sixty boys); one of the school dormitories and the bathrooms adjoining were also visited, as also a recent and most excellent innovation—the drying rooms, to which the boys' clothes are removed after football or in wet weather, and which provide a certainty that they will always have dry clothes to put on. The visitors were most hospitably entertained by the head master and Mrs. Lyttelton, and the visit was not only very enjoyable but highly instructive. It has long been contemplated that the Association should visit some of the leading schools, and now that the ice has been broken, as it were, it is to be hoped that in successive years other schools will be in turn visited, as such meetings cannot fail to be beneficial not only to the school visited, but to the community at large.

THE LONDON SCHOOL BOARD AND MEDICAL CERTIFICATES.

THE medical staff of the Victoria Hospital for Children, Chelsea, and of the Paddington Green Childrens' Hospital, have made a formal protest against a resolution adopted by the School Board for London, authorising the West Lambeth Divisional Committee to appoint six doctors in the division "to examine cases in which the medical certificate produced is considered by the divisional superintendents to be doubtful, or in which it is desirable to have a definite medical opinion." The conditions laid down to govern this experiment are: "(a) That each case be first referred to the divisional member in charge of the school where the child ought to attend. (b) That a payment of 2s. 6d. shall be made for each case examined. (c) That the number of cases to be dealt with in this manner shall not exceed 100 in the year. (d) That the names of the doctors selected shall be forwarded to the magistrates having jurisdiction in the division." The whole scheme appears to be a piece of meddling legislation, and another example of the intrusion of the official between the medical attendant and his patient. If the School Board cannot trust the medical profession to give honest certificates, it had better take the whole matter into its own hands, and appoint medical inspectors to make a medical examination of every child who is away from school on the ground of ill health. It would be very expensive to the ratepayer, but it would save the general practitioner a world of trouble. The certificates are given by the general practitioner as a rule, and by the medical staffs of hospitals invariably, without fee. If the School Board chooses to go out of its way to reflect on the medical profession, it must be prepared to find the profession less ready to meet its onerous requirements. Who calls the tune must pay the piper.

INFECTION IN LODGINGS.

THE Court of Appeal has reversed Mr. Commissioner Chalmers's decision in the Beltway-coed lodging-house case. The plaintiff claimed damages on account of his children having caught scarlet fever while in lodgings at the defendants' house. Admittedly no fault was to be found with the sanitary condition of the house at the time when the lodgings were let, but one of the defendants' family contracted the disease, and so the infection spread to the lodgers. The jury found that the defendant, knowing the child had an infectious disease, concealed that fact from his lodgers, and so caused them to run the risk of infection. On these facts, the learned Commissioner formally entered judgment for the plaintiff, leaving the question of legal liability to be decided by the Court of Appeal. The Court has decided that they are not sufficient. The law apparently does not cast upon a person who lets lodgings the duty of reporting to his lodgers the fact that an inmate of his house is suffering from an infectious disease. If a lodger

brings infection into his house he is bound to disinfect the rooms he occupied before letting them again. So also any person in charge of one suffering from infectious disease is liable to penalties if he conveys or exposes the sufferer in any public place so as to endanger the public safety; but, in the absence of express contract, the landlord is not liable for infection afterwards coming into his house if it was not infectious at the time of letting. He does not warrant his premises to be free from all faults, and cannot be held liable for defects unless he has made himself responsible for them. In the present case the evidence was not sufficient to show that he had incurred such a liability, and the lodger has consequently to put up with his loss without recompense. The result seems likely to encourage letters of lodgings in their proverbial carelessness or indifference to the welfare of their lodgers, which often, as in this case, seems culpable. It emphasises, however, the general principle of our law that, in order to make a man civilly or criminally responsible, whatever he may be morally, some misfeasance on his part must be proved. The mere failure to do something which might seem desirable, but which he was not bound to do, is usually not enough for the purpose of imposing a legal liability. Lodgers who wish to impose more than the ordinary burdens on their landlords must make a special bargain for the purpose; if not, they must look after their own interests. Another state of the law might be better for the public health; but sanitary protection might then be secured at too high a price. So at any rate think the judges of the Court of Appeal.

ASYLUM THERAPEUTICS.

Is the volume of the *Proceedings* of the fiftieth meeting of the American Medico-Psychological Association is reported an address by Dr. Weir Mitchell, which demands the gravest attention at the hands of all those who are interested in the care and treatment of the insane. Dr. Weir Mitchell undertook the task upon the express understanding that he was to have unfettered licence to criticise, and was not to be expected to prophesy smooth things. He used his opportunity to much purpose, and, while we cannot but admire the candour of the speaker, we have almost more admiration for the spirit of the members of the Association, who, knowing what his theme would be, could patiently endure to be thus addressed. Our own asylums are, of course, impeccable, but even granting that they are altogether out of reach of criticism, how, we wonder, would their administrators bear to be addressed in terms such as these? "My next query is as to whether you, who thus govern and make reports and live amongst your armies of the insane, are in all respects doing what you should and might do? We have done with whips and chains and ill-usage, and having won this noble battle, have we not rested too easily content with having made the condition of the insane more comfortable? The question we here ask at starting is if you, who are so powerful within these alien camps, are really doing all that might be done? . . . Frankly speaking, we do not believe that you are so working these hospitals as to keep treatment or scientific product in the front line of medical advance. Where, we ask, are your annual reports of scientific study, of the psychology and pathology of your patients? We commonly get as your contributions to science odd little statements, a report of a case or two, a few useless pages of isolated *post mortem* records, and these are sandwiched among incomprehensible statistics and farm balance sheets. . . . What is the matter? You have immense opportunities, and seriously, we ask you experts, what have you taught us of these 91,000 insane whom you see or treat? . . . It is not a mere well-worked, so-called model institution which I want to see, where easily pleased managers come and go, and routine is perfect, and everyone is satisfied, and the nice little reports describe the new dairy, and the statistics are

there, and we lament the death of our efficient manager Mr. Blank; the whole smug business as monotonously alike as are your asylum corridors. . . . You are labelled as medical superintendents, and some of you allow your managers to think you can be farmers, stewards, caterers, treasurers, business managers, and physicians. You should urge in every report the stupid folly of this. Knowing what we do of the rate of growth of medicine, does any man in his senses think that you can be even decently competent, and have anything to do with outside business? . . . It is a grave injustice to insist that you shall conduct a huge boarding-house—what has been called a monastery of the mad—and keep yourselves honestly able to move with the growth of medicine, and to study your cases, or add anything of value to our store of knowledge." These are burning words. Of course the withers of our superintendents are unwrung, but how the galled jade must wince—in America!

FEE TO MEDICAL WITNESS.

THE question of payment to a medical witness of a proper fee for attending court to give evidence has again been raised, this time at Farnham. Mr. Scott was summoned from his home ten miles off to give evidence, but received no conduct money. When called into the witness box he declined to give evidence unless his fee was paid. The magistrates said they had no power to allow a fee unless the case should be sent for trial. But Mr. Scott declined to be sworn until his fee was secured; so his evidence was dispensed with, and no fee was paid him for his loss of time. He was quite within his rights in declining to give evidence under the circumstances, but he would have been better advised if he had disregarded the summons and not gone near the court at all. Where a witness lives close to the court it may not be safe for him to disregard a summons, where no conduct money has been tendered—the point is doubtful; but where he is so far away as ten miles no court would impose a penalty on him for not attending until the means of doing so had been furnished. This, of course, is only a minor point. The more important matter is that adequate remuneration should be provided in all cases for men who are obliged to sacrifice valuable time for a public object. Hard cases are constantly occurring, but nothing is done to remedy them. The authority with whom it rests to alter the existing regulations is the Home Office. If all those interested were to bring pressure through their Parliamentary representatives (who now presumably will be inclined to please their constituents), something might be done. If they do not, the existing regulations will continue to be unsatisfactory.

CHLOROFORM MANIA.

It would seem that there is no drug capable of producing anesthetic effects which may not be abused by weak-minded persons to their destruction. Opium, morphine, cannabis indica, and the more recently discovered drugs, such as cocaine, sulphonal, and many others, are all abused to a greater or less extent by persons who, having discovered that they obtain relief from pain or unrest from their use, quickly become slaves. It is a symptom of the hysteria and exhausted self-control of the age, out of which we may hope the next generation is taking the best means to grow by a more reasonable attention to physical training. Chloroform is not a drug used at all commonly as a habitual hypnotic, but from time to time cases come to light in which men have become the slaves of the habit of inhaling chloroform daily, or many times a day, to procure sleep or escape from pain. Men of no little eminence in the medical and other professions have become obsessed with the idea that they could not sleep unless thrown into a state of unconsciousness by chloroform. The habit is either more widespread than is generally supposed, or it is spreading, for during recent years a large number of cases of deaths have been inquired into by coroners in which it appeared to be certain that the

deceased was a slave of chloroform. The most recent instance is afforded by an inquest held by Mr. Drew at Hammersmith as to the death of a commercial traveller, who was unnerved by the pain of a whitlow. He used to put chloroform on a cone of paper, which he then placed over his nose and mouth. One morning he was found dead with the cone over his mouth. His widow stated that for nearly eighteen months a bottle containing 2 ounces of chloroform had been delivered at the house daily, so that it is clear that the habit had become well established long before the whitlow began. All forms of habitual intoxication are more or less inimical to health, but there is probably no form of self-indulgence which is attended by so much immediate danger to life.

BACTERIOLOGY AT THE CAPE.

The Colonial Bacteriological Institute, under the direction of Dr. Edington, appears to be in full and active work, and the Government of the Cape is to be congratulated upon the institution of a department likely to do so much good in the advancement of science and arrest of disease. The report for the year 1884 has recently been laid before the House of Assembly, and from it we see that not only have many important investigations been started, but vaccine lymph and a vaccine for "lung sickness" have been largely prepared and distributed. The manufacture of the diphtheria antitoxin, of mallein for glanders, a vaccine for *Sporozikete* and the disease known as liver sickness in calves, and the antirabic virus has also been commenced.

ART IN ITS RELATION TO ANATOMY.

The address of Professor William Anderson on Art in its Relation to Anatomy in the Anatomical Section of the meeting of the British Medical Association will be illustrated by a series of lantern slides representing some of the masterpieces of Greek sculpture, and a selection of plates from the older treatises on anatomy. The address will be given on Wednesday, July 31st, at 10 A.M., in the Chemical Theatre, King's College, Strand. An exhibition will also be made of a collection of illustrated books on anatomy from Berengario de Carpi down to the present day.

THE NEW UNITED STATES ARMY RIFLE AND ITS EFFECTS.

The June number of the *Kansas City Medical Index* contains a report upon further experiments with the new United States army rifle (Krag-Jorgensen) by Brigadier-General J. D. Griffith. The experiments appear to have been made by firing at a cadaver at ranges varying from 500 to 1,000 yards. Judging by the description of individual wounds produced, and by the photogravures which illustrate the paper, the effects of this weapon at these ranges is distinctly severe, the explosive action of the bullet being most marked upon the encapsuled organs; comminution was extensive whenever any bones were struck. Arteries were cleanly cut, not torn, hence the death-rate on the field from hæmorrhage from this weapon will be great. A certain wound of the wrist, mentioned in this report as being made at a range of 600 yards, shows that the extensor tendons of the hand were not injured, although the bullet passed between them, severing their sheaths and pushing the tendons aside. It would seem, therefore, that tendons are the only tissues in the body which, in these experiments, seemed at all turned aside by the ball. Not the least interesting fact elicited by these experiments is that the best protection against the fire of the rifle is loose dry earth; the next best loose sand. The practical deduction is that newly-made and loosely-constructed earthworks will be a better protection than old, or damp, or well-rammed-down parapets of soil. The bullet does not appear to have weight enough to carry it through loose earth. A soldier will be practically safe behind an embankment of from 30 to 36 inches of loose earth, provided it be dry. It is a little difficult to reconcile the severity

of the injuries produced by this rifle upon the cadaver with those produced by the Lee-Metford on the living, and reported in the *BRITISH MEDICAL JOURNAL* of July 20th. It is just possible that the cadaveric tissues have a different potential of resistance to those of the living body. The difference in weight and diameter of the respective bullets is insufficient to account for the disparity in effect. Time and more extended experience of small-bore rifle fire may clear up these discrepancies.

MEDICAL SICKNESS, ANNUITY, AND LIFE ASSURANCE SOCIETY.

The quarterly meeting of the Committee of the above Society was held at 429, Strand, W.C., on July 10th. There were present the Chairman (Dr. F. de Havilland Hall) Dr. J. E. Ball, Dr. J. Ricketts, Dr. Major Greenwood, Mr. J. Brindley James, Dr. W. Knowsley Sibley, Dr. A. S. Gubb, Dr. G. W. Crowe, Mr. R. S. Charsley, Dr. F. J. Allan, Mr. W. J. Stephens, and Mr. H. P. Symonds.

The principal business transacted was the consideration of the report for the year ending June 29th last. It is a very satisfactory record of progress, and shows that the Society, in addition to paying the bonus of £5,000 to its members, has, during the twelve months under review, added to its reserves £9,492 6s. The normal increase of funds was, therefore, over £14,000, and this large reserve was made notwithstanding the fact that the members received the largest amount of benefit money that has ever been expended by the Society in one year. With the view of illustrating the nature of the benefits which the Society confers upon its members a list has been prepared showing the amounts of sickness pay granted during the past year, and, in addition, some examples are given of the heavy sickness claims which the Society has paid since it started in 1884. The list shows that in the year 1894-5 seven members were in sickness benefit during the whole twelve months. Of these 5 received 2 guineas per week, or £109 4s. each, while the other 2 had assured for only half this amount; 1 member received 28 weeks full pay, another 24 weeks, 2 others 23 weeks, and so on. In the statement relating to the whole period of the Society's business 1 case is given in which the member has been in continuous benefit for more than 10 years, and up to the end of June last had received in sickness pay the sum of £1,191. The next case on the list is that of a member who has been in 259 weeks' sickness benefit, amounting in all to £652 10s. In the next the total amount received is £439 18s., and in these and some 5 or 6 other cases there is little hope that the members will ever be able to resume professional work. The Society is now in its twelfth year of working, and its success proves that it was founded on a sound basis and has been conducted with ability and economy. Prospectuses and all particulars on application to Mr. F. Addiscott, Secretary, Medical Assurance Society, 33, Chancery Lane, London, W.C.

THE GRACE TESTIMONIAL.

A REPORT ON THE MILK SUPPLY OF LONDON BY A SPECIAL ANALYTICAL AND BIOLOGICAL COMMISSION. CONDENSED MILKS.

III.

Of the seventeen brands of milk examined by Dr. Dyer and Mr. Cassal, fourteen are found to be prepared entirely from skimmed milk, and show an average of only 0.72 per cent. of fat. Three brands, prepared from partly skimmed milk, or from skimmed milk to which a small proportion of unskimmed has been added, show an average of 3.14 per cent. of fat.

Genuine full-cream brands of condensed milk, such as the well-known "Milkmaid" brand prepared by the Anglo-Swiss Condensed Milk Company, contain from 10 to 12 per cent. of fat.

In the present state of the law, as interpreted by the judicial authorities, condensed skimmed milk, that is to say, milk deprived of one of its chief constituents, namely, fat, in the absence of which it ceases to be milk in the true sense of the word, may lawfully be labelled "condensed milk," although when sold uncondensed it must be distinctly stated at the time of sale that it is skimmed milk; that is, a small milk vendor is fined for selling what a condensed milk manufacturer is at liberty to sell provided he condenses it first, and in an obscure manner states upon the tin that the tin "contains skimmed milk," although upon the face of the same label it is described as "condensed milk."

An examination of the seventeen brands above referred to shows how urgently an alteration in the law is required. Here we have an article of food on which young children are to a very large extent fed. It is scarcely too much to say that the purity and genuineness of this food is of greater importance than that of any other, since any tampering with it or sophistication of it cannot fail to be attended with lamentable results. The abstraction of fat from milk used as food for young children is a most serious matter. In his *Lectures on the Artificial Feeding of Infants*, Dr. Cheadle has rightly pointed out that fat serves a vital purpose in the nutrition of young growing animals, being largely concerned in all cell growth, and necessary for the perfect formation of bone. "I wish to lay special stress," he says, "upon the paramount importance of a due proportion of fat in the feeding of infants, because it is a point most imperfectly recognised by the majority of medical men who direct the feeding of young children. In spite of the significant fact that milk is a rich emulsion of fat, little children are constantly placed on artificial foods which are almost destitute of this vital element." Privation of fat, he adds, is alone sufficient to produce rickets.

It is evident that "milk" is not the same thing as "skim milk" or "separated milk," and that these latter cannot rightfully be described as "milk" without qualification. Milk being essentially "a rich emulsion of fat," as Dr. Cheadle points out, it ought not to be called "milk" after 90 to 95 per cent. of its fat has been removed.

According to the report of our Commission, the "Milkmaid" brand contains 9.80 per cent. more butter-fat than is contained, on an average, in the other brands examined. This is a fact of great importance to the public, and should also serve as a guide to the medical profession when prescribing condensed milk. We have taken the "Milkmaid" brand as a standard, because it is the original condensed milk introduced into Europe about thirty years since, and its uniformly high reputation has helped to maintain the demand for such a product.

Considering the far-reaching and deplorable effects which the use of inferior and impoverished foods must have upon

the lives and well-being of infants to whom they are given (to say nothing of the anxiety and disappointment of parents who are misled into using such foods for their children), we think it of the utmost importance that the medical profession should lay stress on the necessity of using only such brands as are known to come up to this acknowledged standard of excellence.

MISLEADING LABELS.

The existence of these will be apparent to all our readers who will give attention to those shown below. For instance, the "Goat" brand label is illustrated by a maid milking a goat, the inference being that the tin contains condensed goat's milk, and it would scarcely be suspected by the unsophisticated that the tin actually contained Irish-skimmed milk. The same might be said of the "Swiss Dairy" brand, with its Swiss *chalet* as a trade mark, the inference naturally being that the tin contains Swiss milk, though it actually contains Irish skimmed milk. These instances might be multiplied, but the foregoing are sufficient for our purpose, which is to place adequate information before our readers respecting this important subject of infant feeding, and to lay stress on the dangerous prevalence in the market of so-called "condensed milks," which are deprived of the cream, which is a prime element in the value of milk as an element of dietary, especially for the young.

A REPORT

ON SEVENTEEN SAMPLES OF CONDENSED MILK, RECEIVED ON JUNE 8th, 1895, FROM THE EDITOR OF THE "BRITISH MEDICAL JOURNAL."

By BERNARD DYER, D.Sc., F.I.C.,

Public Analyst for the Counties of Leicester and Rutland and the City of Truro.

"SHAMROCK" BRAND (Fat, 0.79 per cent.).

The milk in this sample is all "separated" milk. The principal label describes it in bold letters as "Shamrock brand condensed milk." A side label states in legible, but not what I should call conspicuous, letters that "this tin contains skimmed milk."

"SWISS DAIRY" BRAND (Fat, 0.63 per cent.).

The milk in this sample is all separated milk. The prominent words on the principal label are "Dairy milk." One of the side labels contains in legible, but not what I should call conspicuous, letters the statement "this tin contains skimmed milk."

"CALF" BRAND (Fat, 0.60 per cent.).

The milk in this sample is all "separated" milk. The principal label bears as its conspicuous words "Calf milk." A side label contains in legible, but not what I should call conspicuous, letters the statement "this tin contains skimmed milk."

"CUP" BRAND (Fat, 0.49 per cent.).

The milk in this sample is all "separated" milk. The principal label bears as its conspicuous words "Cup milk." A side label contains in legible, but not what I should call conspicuous, letters the statement "this tin contains skimmed milk."

"TEA" BRAND (Fat, 0.48 per cent.).

The milk in this sample is all "separated" milk. The main label bears the inscription "Tea brand," two side labels containing the clear statement that the tin contains condensed skimmed milk and sugar only, and also a descriptive paragraph in which the milk is spoken of as "condensed skimmed milk." Although the lettering of the word "skimmed" is not remarkably conspicuous, it is nevertheless as conspicuous as the words "condensed" and "milk;" in fact, the only words on the tin that could really be described as conspicuous are the words "Tea brand."

<p>THE "WHEATSHEAF" BRAND</p>  <p>BEST CONDENSED MILK</p>	<p>The "WHEATSHEAF" Brand</p> <p>CONDENSED MILK</p> <p>is prepared from Skimmed Cow's Milk to which nothing but the finest cane sugar has been added. The Milk will keep in any season or climate and it is particularly recom- mended for all culinary purposes, for use on board ships, etc</p>
--	---

"WHEATSHEAF" BRAND (Fat, 0.62 per cent.).

The milk in this sample is all "separated" milk. The principal label bears, in conspicuous letters, the words "Wheatsheaf brand best condensed milk." The statement

that it "is prepared from skimmed cow's milk" occurs in small and comparatively inconspicuous letters in a descriptive paragraph to be found on a side label.

<p>THIS PRESERVED MILK contains no addition to the Cows' Milk except a small quan- tity of Refined Sugar.</p> <p>There being a small portion of the cream removed in the process of condensation, it is specially adapted for Household Purposes, such as for Puddings, Custards, Tea and Coffee</p>	<p>MARGUERITE</p> <p>BRAND.</p> <p>❖ FINE ❖</p> <p>CONDENSED MILK.</p> 
---	--

"MARGUERITE" BRAND (Fat, 0.42 per cent.).

The milk in this sample is all "separated" milk. The principal label bears in conspicuous letters the words "Mar-

guerite brand fine condensed milk." One of the side labels bears, in small but fairly conspicuous letters, the statement that "this is sold as skimmed milk." The other side label states that "there being a small portion of the cream removed in the process of condensation, it is specially adapted for household purposes, such as for puddings, custards, tea and coffee." This statement that a small portion of the cream has been removed appears to be a directly misleading one when applied to a sample manufactured altogether from highly "separated" milk—of course with the addition of sugar, which is common to all the samples.

<p>THE</p> <p>DAILY</p>  <p>CONDENSED MILK</p> <p>BRAND</p>	<p>THE</p> <p>DAILY BRAND</p> <p>of</p> <p>Condensed</p> <p>MILK</p> <p>skimmed Milk</p> <p>warranted free of foreign mat- ters but pure re- fined sugar.</p> <p>Prepared in Holland.</p>
--	---

"DAILY" BRAND
(Fat, 0.42 per cent.).

The milk in this sample is all "separated" milk. The label contains, in very small and comparatively inconspicuous letters, the words "skimmed milk."

"GONDOLA" BRAND (Fat, 0.49 per cent.).

The milk in this sample is all "separated" milk. All three labels on the tin bear the inscription "skimmed milk." The description on the main label contains the words "skimmed milk" in clear and conspicuous characters.

CONDENSED MILK.

This milk, prepared from the best and purest cows' milk, from the richest pasture grounds in Holland, is absolutely free from bacteria and other injurious substances and excels in every respect the usual milk.

It may although partly skimmed, be recommended especially for ships' use, hospitals, travellers etc., but above all for children, being the most harmless children's food, concerning quality and extremely digestive.

DIRECTIONS FOR USE.

The milk should be taken out of the tin with a dry spoon and dissolved in pure water. This however should be added gradually in small quantities and according to the requirement of the user.

Adding only a little water will produce a milk well fitted for coffee, cocoa etc. For culinary purposes add 3 parts water to one of milk. For infants 5 or 6 times as much water shall be added.

PREPARED IN HOLLAND

"CLIPPER" BRAND (Fat, 0.73 per cent.).

The milk in this sample is all "separated" milk. The main label bears the inscription "Clipper brand condensed skimmed milk" in clear and conspicuous letters.

PREPARED IN HOLLAND

"AS YOU LIKE IT" BRAND (Fat, 4.23 per cent.).

I am of opinion that about 60 per cent. of the milk in this sample is "separated" milk, and not more than about 40 per cent. of it whole milk. The total proportion of fat is only about two-fifths of what it would be in a sample prepared from whole milk. The principal label bears, in conspicuous letters, the words "condensed milk, 'As You Like it' brand." It is only on carefully reading a paragraph

in very small type that one obtains the information that it is partly skimmed. The paragraph states that "it may, although partly skimmed, be recommended, especially for ships' use, hospitals, travellers, etc., but above all for children, being the most harmless children's food concerning quality, and extremely digestive."

CONDENSED MILK.

This milk is prepared from the milk of cows fed on the richest pastures of Holland and is absolutely free from bacteria and all noxious germs.

It is especially adapted for use with Tea or Coffee, for all culinary purposes, and on board Ship, while the regularity in its quality and food constituents renders it particularly suitable for infants' food.

**"NUTRIENT" BRAND (Fat, 2.36 per cent.).**

I am of opinion that about 80 per cent. of the milk in this sample is "separated" milk, and only about 20 per cent. whole milk. There is a distinct statement on the label, though not in very large type, to the effect that "this tin contains skimmed milk." There is also a statement to the effect that the contents of the tin are "prepared from the milk of cows fed on the richest pastures in Holland," and that "it is especially adapted for use with tea or coffee, for

all culinary purposes, and on board ship, while the regularity in its quality and food constituents renders it particularly suitable for infants' food," a statement which in my opinion ought scarcely to be made in reference to a condensed milk prepared with so large a proportion of separated milk that it contains not more than about one-fifth of the fat that would be found in condensed milk made from whole milk.

GOAT BRAND

THIS TIN CONTAINS SKIMMED MILK.
With nothing added but the Finest Sugar.

By the addition of a little water to reduce it to required consistency, it may be used for almost every purpose to which ordinary skimmed milk is used.

It will be found excellent for all cooking purposes, Coffee, Tea, Chocolate, or Fresh Fruits, meaning Mince-manges, Puddings, &c.

It is strongly recommended for the following important reasons:

1st—Its uniform quality and non-liability to any partial change whatever.

2nd—The process of preserving and condensation, and its reliable source, render it absolutely incapable of transmitting the germs of

TYPHOID FEVER, SCARLET FEVER, DIPHTHERIA,

and other diseases, thereby proving its superiority over ordinary skimmed milk.

GOAT

REGISTERED TRADE MARK

CONDENSED MILK

"GOAT" BRAND (Fat, 0.56 per cent.).

The milk in this sample is all "separated" milk. The principal label bears as its conspicuous words "Goat brand," with a picture of a goat being milked. A side label contains

in legible but not what I should call conspicuous characters the statement "this tin contains skimmed milk."

MILK

COW BRAND.

Condensed

MILK

COW

BRAND

Partly Skimmed

Prepared in
HOLLAND.

"COW" BRAND (Fat, 2.81 per cent.).

I am of opinion that at least 70 per cent. of the milk in this sample is "separated" milk, and not more than 30 per cent. of it whole milk. The milk is described on the label in small though fairly conspicuous letters as "partly skimmed." Although a literally correct description, it does not necessarily convey that the removal of fat has been carried so far that the sample contains only about one-fourth of the fat to be found in condensed milk made without any admixture of separated milk.

"HANDY" BRAND (Fat, 1.49 per cent.).

I am of opinion that at least 90 per cent. of the milk in this sample is "separated" milk. The label contains, in a tolerably conspicuous position, the statement that the tin contains condensed skimmed milk, but the word "skimmed" is printed in letters sufficiently small to render them much less noticeable than the words "condensed" and "milk."

"CROSS" BRAND (Fat, 0.96 per cent.).

The milk in this sample is all "separated" milk. It is described on the labels as "condensed skimmed milk," but the word "skimmed" is in exceedingly small and inconspicuous type. There is also, in small type, the statement that "this milk is skimmed, but is absolutely pure, and free of any foreign substance but the best cane sugar."

"HOME" BRAND (Fat, 1.02 per cent.).

The milk in this sample is, practically speaking, all "separated" milk. The tin bears, in a tolerably conspicuous position, the statement that it contains condensed skimmed milk, but the word "skimmed" is printed in letters sufficiently small to render them less noticeable than the words "condensed" and "milk."

"MILKMAID" BRAND (SWISS).

A sample of the Milkmaid Brand milk was subsequently submitted to Dr. Dyer who reports that it contains 10.92 per cent. of fat. This will show the amount of fat which a condensed milk of good quality should contain.

BATHS AND HEALTH RESORTS OF THE UNITED KINGDOM.

THE REPORT OF THE ROYAL MEDICAL AND SURGICAL SOCIETY.¹

I.

A RESOLUTION was passed at a meeting of the Council of the Royal Medical and Surgical Society on May 14th, 1889:

That a Scientific Committee be appointed for the purpose of investigating questions of importance in reference to the climatology and balneology of Great Britain and Ireland, and to report hereon to the Council from time to time.

The Committee, as at present constituted, consists of Dr. W. M. Ord (Chairman), Dr. R. Barnes, Dr. Mitchell Bruce, Dr. Cheadle, Dr. Dickinson, Dr. W. Ewart, Dr. Lazarus-Barlow, Dr. R. Maguire, Dr. Norman Moore, Mr. Malcolm Morris, Dr. Murrell, Dr. Penrose, Dr. F. Roberts, Dr. F. Taylor, Dr. Symes Thompson, Dr. Hermann Weber, Dr. Theodore Williams, and Dr. E. Garrod (Secretary).

The first report of the Committee, now published in the form of the solid volume before us, presents the result of their inquiries. It embodies (1) a large mass of information received from medical men practising in various places in reply to a schedule of questions; (2) the results of personal investigation in various localities by members of the Committee; and (3) the analysis of published and trustworthy statistics as to the several localities included in the scope of the inquiry.

The work is divided by a natural line of cleavage into two parts, dealing respectively with the effects of climate, and with the therapeutic action of mineral springs. In the climatological portion of the Southern Counties, and particularly the South Coast of England from the Land's End to the North Foreland, are considered. In some excellent "Introductory Remarks" Dr. Ord rapidly reviews the physical and climatic characteristics of the South Coast. He takes the opportunity of giving a few words of advice as to the precautions to be observed by inland dwellers who go to the seaside, which are especially opportune at the present moment. He points out that as a rule they require warmer clothing than at home, and he explodes the dangerous superstition that sea water is always innocuous and stimulating whether it is applied in wet clothing or directly to the naked body. As regards bathing more particularly, Dr. Ord reminds us that the average temperature of the water on our coasts, although raised by the presence of the Gulf Stream, is not more than about 50° F., that is to say at least 48° less than the natural temperature of the body.

Dr. Dickinson discusses the climatology of Cornwall in a manner at once judicial and sympathetic; his description of the manifold beauties of its broken coastline gives evidence of a considerable gift of word painting, but his feeling for the picturesque by no means blinds him to climatic shortcomings. He admits that Cornwall is a region to be avoided by persons of rheumatic tendencies, that the coasts in general appear to favour the development of skin disease, especially eczema; and that anaemia is promoted by some of the maritime districts, notably the Scilly Islands. On the other hand, he states that the county as a whole presents influences, probably in the water, which are preventive of urinary stone and gravel; that renal affections attended with albuminuria are generally infrequent on the Cornish coasts; that the absence of extremes of cold on the south coast, and more especially in Scilly, tends to minimise inflammatory affections of the respiratory organs in the population, and to ameliorate them in the individual. The north coast he thinks a promising resort for asthmatics, and its climate, especially of that high level district of which Camelford is the centre, he considers to be adverse to the development of tubercle.

Dr. Symes Thompson and Dr. Lazarus-Barlow treat of the climate of Devonshire. Its therapeutic effects are considered mainly in reference to three classes of disease, (1) respiratory, particularly phthisis, (2) renal, and (3) rheumatic, with allied

and subsequent conditions. As regards phthisis, the advantages are said to be that the air is moist and unirritating, that there is a large average amount of sunshine, and that the temperature is comparatively equable. The disadvantages are the moistness of the air, the physical character of the ground, and the prevalence of easterly winds in spring. "Winter cough" is greatly benefited, and asthma of the bronchial and cardiac forms is often relieved by residence in Devonshire. South Devon is markedly serviceable in cases of recurring catarrh of an irritative type, particularly in children; but the climate is not favourable for healthy children. For the subjects of renal disease Exeter, Sidmouth, and the more dry, elevated, and sunshiny resorts in the neighbourhood, "are perhaps the least injurious spots in England." Cases of rheumatism ought not to be sent to Devonshire, which appears to be generally unsuitable for persons suffering from cardiac disease. The climate is not sufficiently bracing for scrofulous children, but it is especially favourable to old and debilitated persons, and to convalescents from most illnesses, the principal exception being acute rheumatism.

Drs. Symes Thompson and Lazarus-Barlow also deal with the climate of the Channel Islands. The strong point in these resorts is the sunshine, their record in this respect being considerably in excess of that of any other part of the United Kingdom. The Channel Islands are remarkably free from acute diseases. Phthisis is mainly seen in the acute form and does not seem to be affected by the custom of intermarriage, which, owing to the existence of the law of gavelkind, is very general among the natives. The moisture of the air makes the islands unsuitable in renal disease and in all rheumatic and neuralgic affections, and its salt-laden condition renders it injurious to all forms of eczema. On the other hand the value of the Channel Islands for delicate strumous or rickety children is said to be immense.

The report on the climate of Somerset is from the pen of Dr. Mitchell Bruce. Owing to the fact that Bath is dealt with under the head of Medicinal Springs, the article is something like *Hamlet* with the part of the Prince of Denmark left out. But the coast towns—Minehead, Weston-super-Mare, Clevedon, Burnham, etc.—in which the chief interest of the county from the climatological point of view is localised, are described in sufficient detail.

(To be continued.)

SOME BATHS OF SWITZERLAND AND GERMANY.

THE somewhat fugitive literature of baths and health resorts falls thickly upon us at this season of the year. Switzerland is always well to the fore with its almost countless resorts and endless variety of attractions. Among the handbooks before us, some refer to old acquaintances, others are comparatively new.

MAGGLINGEN.¹

Magglingen is a mountain resort in the Swiss Jura, situated above the lake and town of Bienna, at an elevation of 8,000 feet above the sea. It is about 1½ hour's drive from Bienna railway station, and there is also a funicular railway by which to ascend. The Kurhaus is surrounded by pleasant woods on a sunny declivity of the foremost chain of the Jura, and commands an extensive though distant view of the Alps. The climate is subalpine and mild, and the place is free from great heat and cold, and free from dust. It is especially recommended to convalescents, to cases of anaemia and neurasthenia, sleeplessness, catarrhal respiratory affections, obesity, and circulatory disturbances. Treatment by hydrotherapy, electricity, gymnastics, massage, diet, and by an adaptation of Oertel's terrain cure is applied to suitable cases under the directions of a resident physician from Berne.

ST. BRATENBERG.²

St. Bratenberg is finely situated above the Lake of Thun, at an elevation of nearly 4,000 feet above the sea. It is already well known, and is a favourite Alpine resort, especially for those who need an after-cure in mildly bracing air, as the complement of a bath cure at one or other of the Continental spas. A funicular railway now connects the western

¹ Magglingen: Climate, Air, and "Terrain" cure.

² Bratenberg: Climatic and Health Resort.

¹ The Climate and Baths of Great Britain, being the Report of a Committee of the Royal Medical and Surgical Society of London. Vol. I.—The Climate of the South of England, and the Chief Medicinal Springs of Great Britain. London and New York: Macmillan and Co. 1895. Demy 8vo. 21s. nett.

end, near the Kurhaus, with the Lake of Thun, and the transit takes only a quarter of an hour. St. Beatenberg stretches away along the side of the mountain for nearly three miles from the Kurhaus to the Alpen-Rose Hotel, at the eastern end, where pleasant walks abound. There are fine views of the Bernese Alps. The Kurhaus is open both winter and summer, and is especially destined for the reception of cases of chronic catarrhal affections of the respiratory organs.

SCHIMBERG.²

These baths (situated at an elevation of about 4,600 feet above the sea) possess an alkaline sulphur spring (cold) and a chalybeate spring. The Kurhaus is reached by a drive of two and a-half hours from Entlebuch Station, on the line of rail between Lucerne and Berne. It is a moderately high mountain resort, with sulphur and iron waters. The bath establishment is built on an incline looking west, and is surrounded by pine woods. It is protected by the mountain (Schimberg) from the north and east, but is fully exposed to the south-westerly winds, which sometimes blow with violence. The relative humidity is rather high. Fogs occasionally rest at this elevation, and sudden changes of temperature must be at times expected. The alkaline-sulphur water is used in the treatment of catarrhal affections of the air passages, of the stomach and intestines, of the bladder, and other pelvic organs; the iron spring in cases of chlorosis and anemia.

FARNBUHL.⁴

These baths are approached from the station of Malters, on the same line as Entlebuch, and between it and Lucerne. Farnbühl is situated about an hour's drive from the station, and possesses an iron spring which is utilised in the treatment of cases of chlorosis and anemia, and is an appropriate, quiet, mild mountain resort for convalescent and debilitated neurasthenic persons. It lies in a sheltered situation, and promenades through shady woods are adjacent to the Kurhaus. Living there is very cheap.

LEUKERBAD.⁵

The baths of Leuk we have on a former occasion fully described. The little guidebook which is now before us is written by Dr. Ad. Brunner de Riedmatten, and translated into English by J. P. Sandlands, who observes in his preface "There is nothing better for a man, tired in body and wearied in mind, than to seek invigoration for both at Löche." Few travellers in Switzerland have missed seeing the quaint and interesting baths of Leuk at the foot of the remarkable Gemmi pass. The thermal springs are resorted to more especially for chronic eczema and other forms of chronic skin disease; but the situation of the place is so attractive that many stay there simply for an air cure, and for its pleasant walks and excellent hotel accommodation. Its elevation is about 4,700 feet above the sea.

SOOLBAD RHEINFELDEN.⁶

This salt bath is pleasantly situated on the left bank of the Rhine, at a distance by rail of only eight or nine miles from Bale, so that it is quite easily accessible. Lying between the Black Forest and the Jura, there are most pleasing excursions to be made in the neighbourhood. The salt waters are used chiefly for baths and other external applications. Douches of river water as well as employed, and massage and electrical treatment can be obtained. The cases suitable for treatment there are similar to those sent to Kreuznach or Bex, and the situation of Rheinfelden is much superior to that at Kreuznach. All forms of scrofula, chronic diseases of the bones and joints, chronic rheumatism, vascular sluggishness of the skin, anemia, and disease of the pelvic viscera in the female, these are the maladies there dealt with.

WILDUNGEN.⁷

This little book is designed to make the springs of Wildungen better known to English practitioners. These are alkaline earthy springs, and they are employed principally

in the same class of cases as the waters of Contrexéville and Vittel, in France—namely, in diseases of the urinary passages, and especially in calculous disorders. It has also a chalybeate spring (the Stahl Quelle). Wildungen is in the principality of Waldeck, and is reached by a branch line from Wabern, a station on the railway between Cassel and Frankfurt. Such cases as we have indicated, and especially calculi of the urinary tracts, are quite as advantageously treated there as at Contrexéville.

(To be continued.)

ASSOCIATION INTELLIGENCE.

COUNCIL.

NOTICE OF MEETINGS.

MEETINGS of the Council will be held in the Council Room, Exeter Hall, Strand, London, W.C., on Tuesday, July 30th; Wednesday, July 31st; and Thursday, August 1st next, at half-past 9 o'clock each day.

NOTICE OF LAST QUARTERLY MEETING FOR 1895. ELECTION OF MEMBERS.

A MEETING of the Council will be held on October 23rd, 1895. Candidates for election by the Council of the Association must send in their forms of application to the General Secretary not later than twenty-one days before the meeting—namely, October 2nd, 1895.

Any qualified medical practitioner, not disqualified by any by-law of the Association, who shall be recommended as eligible by any three members, may be elected a member by the Council or by any recognised Branch Council.

Candidates seeking election by a Branch Council should apply to the Secretary of the Branch. No members can be elected by a Branch Council unless their names have been inserted in the circular summoning the meeting at which they seek election.

FRANCIS FOWKE, General Secretary.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

MEMBERS are reminded that the Library and Writing Rooms of the Association are fitted up for the accommodation of the members in commodious apartments, at the offices of the Association, 429, Strand. The rooms are open from 10 A.M. to 5 P.M. Members can have their letters addressed to them at the Office.

BRANCH MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—The annual meeting, which was unavoidably postponed, will be held at Dunfermline in the third week of August. Due notice will be given by circular. — J. ALTHAM, Honorary Secretary, Penrith.

MIDLAND BRANCH: DERBYSHIRE DIVISION.—There will be a meeting at the Whitworth Institute, Darley Dale, on Thursday, September 13th. The President, Dr. NIXON, kindly invites the presence of all members, and Lady Whitworth will throw open her gardens and grounds. Afterwards it is proposed to drive to Matlock Bath to dine at the New Bath Hotel. Members are requested to give notice of contributions to be brought before the meeting before August 20th to J. A. SOUTHERN, Honorary Secretary, Friar Gate, Derby.

DORSET AND WEST HANTS BRANCH.

THE summer meeting of this Branch was held at Bridport on July 17th, under the presidency of Mr. C. H. W. PASTORS. Twenty-three members and visitors were present.

New Members.—The following were elected:—Mr. Charles Percival Felvus (of the Dorset County Asylum), Mr. Percy John Kingston (of Yeovil), and Mr. Henry William Scratchley (of Poole).

The Abuse of Medical Charities.—The following report from the Committee on the Abuse of Medical Charities was received and adopted:

That a series of questions has been addressed to the Secretaries of the Medical Charities in the district, that replies had been received from all; that the replies had been tabulated, and that the Committee had resolved: "That all hospitals and institutions that receive out-patients should either require out-patient tickets or a letter of recommendation from the patient's medical man stating that the case is a suitable one."

¹ The Baths of Entlebuch, and Schimberg.

² The Baths of Farnbühl.

³ The Baths of Leuk.

⁴ The Baths of Farnbühl.

⁵ The Baths of Leuk.

⁶ The Baths of Rheinfelden.

⁷ The Baths of Wildungen.

¹ Wildungen, the Baths and Mineral Springs, by Dr. A. Stoecker. Translated by Dr. Harter. London: Triemer and Co., Ludgate Hill, E.C. Small 8vo, pp. 40.

Discussion.—A discussion on "Is Cancer a Waterborne Disease?" with special reference to its occurrence in chalk valleys and districts containing periodical springs and rivulets, was opened by Mr. T. W. BLAKE, Vice-President, and taken part in by Mr. MARSH, Dr. McLEAN, the President, Dr. CARTER, Dr. LUEH, Dr. LAWSON, and Dr. MACDONALD.

Communications.—The following communications were made: Dr. LAWRIE, Appendages Removed from Two Cases of Abdominal Section; Dr. CARTER, Description of a new Ether Inhaler; Mr. EWENS, Enucleation of Tuberculous Glands.

Next Meeting.—It was resolved that the autumn meeting should be held at Boscombe on October 16th.

Dinner.—The members dined together at the Bull Hotel.

NORTH OF IRELAND BRANCH.

The annual meeting was held in the Royal Hospital, Belfast, on Thursday, July 18th, at 11.30 A.M. Dr. DEMPSEY, the President, occupied the chair, and 44 members were present. The minutes of the last annual meeting were confirmed.

Reports.—The Secretary's report and Treasurer's statement were taken as read, and adopted by the meeting, on the motion of Dr. JOHN CAMPBELL, seconded by Dr. LINDSAY. The report showed that the number of members was 242. The Council deeply regretted that they had to record the deaths of two young members, Drs. Daniel Jamison and Hugh Heron. Four meetings had been held during the year, and a large number of communications had been discussed. The balance sheet showed that the Treasurer had in hand £70 8s.

Election of Office Bearers.—Dr. James Stuart (Ballymena), having been nominated by Professor BYRNS, Dr. LINDSAY, and Dr. O'HARA, was unanimously elected *President*. *Vice-Presidents*: Dr. Gausson (Dunmurry) and Professor Sinclair (Belfast). *Members of Council: Country*: Dr. St. George (Lisburn), Dr. Palmer (Armagh), Dr. Hall (Monaghan), Dr. O'Hara (Ballymena), Dr. Thompson (Omagh), Dr. M'Alister (Carrickfergus), Dr. Dunlop (Holywood), and Dr. Tate (Downpatrick); *Belfast*: Mr. Fagan, Professor Cuming, Dr. Walton Browne, Dr. Calwell, Dr. Lindsay, Dr. M'Caw, Professor Byers, and Dr. Bingham. On the motion of Dr. DEMPSEY, seconded by Dr. O'NEILL, Dr. George Gray (Newcastle, co. Down) was re-elected *Treasurer*, and, on the motion of Dr. DEMPSEY, seconded by Mr. FAGAN, Dr. John Crimphall was re-elected *Secretary*. Dr. M'KEOWN moved and Dr. STUART seconded the appointment of Dr. Dempsey and Dr. John Campbell as *Representatives of the Branch on the Council of the British Medical Association*. This was passed unanimously. On the motion of Dr. St. GEORGE, seconded by Dr. MACKENZIE, Dr. Stuart (Ballymena) was elected *Representative of the Branch on the Parliamentary Bills Committee*. Drs. M'Caw and James Wallace acted as scrutineers of the voting papers.

New Members.—Dr. Lorrain Smith was elected a member of the Branch, and Drs. Tweedie and James Graham were re-elected.

President's Address.—The retiring President (Dr. Dempsey) delivered an interesting and instructive address on the Clinical Aspects and Treatment of Pelvic Inflammation. When he had concluded, Mr. FAGAN proposed that the best thanks of the meeting be given to Dr. Dempsey for his conduct in the chair and for the devotion he had shown to the best interests of the Branch during his year of office as well as for the address he had just read. This was seconded by Dr. MARK and passed by acclamation.

Communications.—Mr. JOHN FAGAN showed three cases illustrating the Surgery of the Ankle-joint: (1) A case of Chronic Arthritis, where he removed the joint together with the astragalus and upper surface of the os calcis; (2) a case of Simple Fracture Dislocation of the Astragalus, where the bone was removed; (3) a case of Compound Fracture Dislocation of the Astragalus, where this bone, together with the scaphoid and tips of the malleoli, were removed. Dr. O'NEILL testified to the great advantage of early and thorough operation in such cases, and Drs. DARLING, M'DONNELL, and DEMPSEY also spoke of Mr. Fagan's admirable results.—Dr. LINDSAY showed a case of Tachycardia, dating from severe emotional disturbance, and made brief remarks on the affection. Many of the members examined the patient, and much interest was taken in the case. Drs. O'NEILL, M'DONNELL,

and DARLING made some remarks, and the President (Dr. Dempsey) mentioned a similar case, where a complete and permanent cure suddenly took place.—Dr. HENRY O'NEILL showed a patient on whom he had operated with success for Dupuytren's Contraction of the fingers. He exhibited casts of the hand taken before and after treatment, and an appliance made by Mr. Sloan for the purpose of preventing recurrence. Dr. O'Neill recommended operation by multiple punctures and subcutaneous division of the fascia. He contrasted the condition of one hand of the patient, which had been treated in Glasgow by free incision and removal of the fascia, with that of the other upon which he had operated by the subcutaneous plan. Mr. FAGAN spoke of the anatomy of the disease, and said he preferred excision of the fascia. Dr. BINGHAM referred to his experience in treating a case of hammer toe, and Dr. FRASER mentioned a case where riding a tricycle appeared to have started the contraction. Dr. O'NEILL replied.—Dr. S. ALEXANDER read notes of five cases of Puerperal Eclampsia. Dr. MACCORMAC made some remarks regarding the cause of paralysis in one of the cases.—Professor SINGLATER read notes of a successful Laparotomy for Acute Intestinal Obstruction by Meckel's diverticulum, and showed by a drawing the relation of the bowel to the obstructing band. He also read notes of a successful operation for Recurrent Appendicitis. The patient, a young gentleman, had had seven successive attacks, and was unable to take solid food of any kind. The appendix was shown, and a coprolith in its interior was pointed out. Much interest was evinced in both these operations. Owing to lack of time several important contributions were held over.

Lunch.—At the conclusion of the business the members lunched together in the Grand Central Hotel.

CORK AND SOUTH OF IRELAND BRANCH.

A SPECIAL meeting was held on July 18th, 1895, Professor E. R. TOWNSEND in the chair.

Massage Establishments.—The following resolution was unanimously adopted:

The South of Ireland Branch of the British Medical Association having read the draft Bill to regulate establishments for massage and hypnotism approve of the same, and also of its being extended to Ireland.

Midwives Registration Bill.—It was proposed to postpone the consideration of this Bill until the annual meeting in October.

Hospital Abuse.—It was resolved:

That this Branch is strongly of opinion that active measures should be taken to try and limit the present external abuses of hospital charity, and would therefore suggest that with this intention a general hospital inspector should be appointed to inquire into the merits of any case coming under his notice, and to take any subsequent steps to correct the abuses in accordance with the suggestions of the Medical Charities Committee of the British Medical Association. That the notice sent by the Secretary of the British Medical Association be hung in all the external departments of the hospitals in the city.

Medical Defence.—The following resolution was adopted:

That it is to the interest of the public and of the medical profession that the Council of the British Medical Association should take power and authority to protect both the interests, individual and collective, of the medical profession, and that the Council be requested to take such steps as may be necessary to enable it to actively undertake these duties.

Medical Clubs in Cork.—The Committee on Cork Medical Clubs for the year ending July 9th, 1895, presented the following report:

In presenting their report the Committee wish to give a brief summary of the struggle which is being waged by the members of the medical profession of the city of Cork against the abuses of clubs and societies in the city. For some years this subject had engaged the attention of the South of Ireland Branch of the British Medical Association, and under the auspices of this body a series of general meetings of the profession practising in the city was held towards the end of July, 1891, and a code of rules adopted and signed by all the medical men resident in the city, with one exception. These rules were forwarded to the secretaries of the various clubs and societies on October 26th, 1891, and on November 23rd a joint circular was received from sixteen of those societies, refusing to accept them. Acting under legal advice the medical officers of these societies sent in their resignation on December 26th, and finally ceased to act as medical attendants on February 1st, 1895. A lengthened newspaper controversy arose in which the action of the profession was grossly misrepresented, but the members of the profession, with commendable wisdom, refrained from entering into it. A deputation, consisting of Drs. Corby, Cummins, and Lee, introduced by our representa-

vice, Dr. Sandford, waited on the Council of the British Medical Association at its quarterly meeting on January 18th, 1895, to bring the facts of the dispute before that body. The Council passed a resolution fully concurring in the movement, and sent a minute of the proceedings to all the branches, bringing the matter under their notice. As a result of this and of the cordial support of the various medical journals and associations we are happy to be able to state that both moral and material has been received from all parts of England, Scotland, and Ireland, so that the indemnity fund, to which £200 was subscribed by the profession in Cork, is now increased to over £200. In imitation of the stand which we are making, the profession in many places elsewhere have combined and drawn up rules which are pretty closely modelled on our code, so that the recusant clubs will soon find arrayed against them the medical profession of all the United Kingdom. With a view to forward this generalisation of the movement, we would suggest that a resolution be framed similar to that adopted at Dover and Edinburgh, recommending that this and other cognate subjects should be taken up by the British Medical Association, and that if necessary the constitution of that body should be altered, so as to admit of this being done efficiently.

Branch Representatives.—Dr. Arthur W. Sandford was re-elected representative of the Branch on the Council of the Association, and Professor E. R. Townsend, M.D., on the Parliamentary Bills Committee.

PROCEEDINGS OF THE COUNCIL.

At a meeting of the Council, held at the offices of the Association, 429, Strand, London, W.C., on July 10th, 1895:

Present:

Dr. J. WARD COUSINS, President of the Council, in the chair.

Dr. E. LONG FOX, President.

Mr. HENRY T. BUTLIN, Treasurer.

Dr. JAMES BARR, Liverpool. Mr. EVAN JONES, Aberdare.
Dr. G. B. BARRON, Southport. Mr. C. N. MACNAMARA, London.
Dr. MICHAEL BEVERLEY, Norwich. Mr. H. J. MANNING, Salisbury.
Dr. THOMAS BRIDGWATER, Harrow-on-the-Hill. Dr. J. W. MILLER, Dundee.
Mr. LANGLEY BROWNE, West Bromwich. Mr. W. JONES MORRIS, Portmadoc.
Dr. J. SPOTTISWOODE CAMERON, Leeds. Mr. C. H. WATTS PARKINSON, Wimborne Minster.
Mr. ANDREW CLARK, London. Dr. CHARLES PARSONS, Dover.
Dr. H. RADCLIFFE CROCKER, London. Dr. F. M. POPE, Leicester.
Dr. GEORGE W. CROWE, Worcester. Dr. ROBERT SAUNDY, Birmingham.
Dr. E. H. DICKINSON, Liverpool. Dr. E. MARKHAM SKERRITT, Clifton, Bristol.
Dr. J. LANGDON H. DOWS, London. Mr. NOBLE SMITH, London.
Brig.-Sur.-Lt.-Col. E. F. DRAKE-BROCKMAN, London. Dr. R. SOMERVILLE, Galashiels.
Mr. GEORGE EASTES, M.B., London. Mr. HENRY STRAN, Saffron Walden.
Dr. W. A. ELLISTON, Ipswich. Dr. J. ROBERTS THOMSON, Bournemouth.
Dr. J. H. GALTON, Upper Norwood. Dr. WILLIAM THOMSON, Dublin.
Dr. BRUCE GOFF, Bothwell. Dr. THEOPHILUS W. TREND, Southampton.
Dr. WILLIAM GORDON, Exeter. Mr. T. JENNER VERRALL, Brighton.
Dr. H. HANDFORD, Nottingham. Dr. W. F. WADE, Birmingham.
Dr. JOHN D. HARRIS, Shrewsbury. Mr. FREDERICK WALLACE, London.
Mr. J. HUGHES HEMMING, Kimbolton. Mr. O. G. WHEELHOUSE, Fliley.
Dr. C. HOLMAN, London. Mr. JOSEPH WHITE, London.
Mr. T. VINCENT JACKSON, Wolverhampton. Dr. A. D. WILLIAMS, Hampton Hill.
Mr. T. R. JESSOP, Leeds. Mr. ALFRED WINKFIELD, Oxford.

The minutes of the last meeting having been printed and circulated, were taken as read and signed as correct.

Read letters of apology for non-attendance from Mr. Jordan Lloyd, Mr. Arthur Jackson, Dr. Urquhart, Dr. Batten, Dr. Winterbotham, Dr. Finlay, Dr. Campbell, and Dr. Philipson. The new by-laws of the Lancashire and Cheshire Branch were then considered, together with a letter from Dr. Rentoul on the same.

Resolved: That the proposed new by-laws of the Lancashire and Cheshire Branch be received and approved.

Read communications from Shropshire and Mid-Wales Branch, one strongly commending the action of the medical

men of Cork in reference to the benefit clubs in that city as worthy of all support, and strongly condemning the conduct of those medical men who accept such appointments under existing circumstances; and "That the members of this Branch consider that the time has arrived when the Council of the British Medical Association should take action whereby they may be able to devote some of their funds to the prosecution of unqualified practitioners."

In reference to the minute of Council 3129: Read letter from the Solicitor enclosing counsel's opinions on Dr. Anderson's case, and the use of the funds of the Association for the prosecution of unqualified practice.

DR. ANDERSON'S APPEAL.

14, Austin Friars, London, E.C., May 16th, 1895.

My dear Sir,—I send you copy of Mr. Dixon's opinion on the above, and which you will see is governed by his opinion on the subject of proceedings in respect of unqualified practice.—Yours very truly,

JAMES R. UPTON.

DR. ANDERSON'S CASE.

Copy Opinion of Mr. Dixon.

For the reasons given in my opinion on the case relating to the prosecution of quacks, I think that the Council cannot be advised to make a grant towards the expenses of Dr. Anderson's appeal.

(Signed)

JOHN DIXON.

May 16th, 1895.

11, New Square, Lincoln's Inn.

Copy of Council's Opinion.

I am of opinion that in construing the Memorandum of Association of the British Medical Association, the objects referred to in paragraph (c) of clause 3 must be held to be the objects specified at the commencement of that clause—namely, "the promotion of medical and the allied sciences and the maintenance of the honour and the interests of the medical profession," but I think that it is so doubtful whether the words in paragraph (c) "and such other lawful things as are incidental to or conducive to the attainment of the above objects" include things which are not similar to any of the things specified in paragraphs (a), (b), (d), and (e) that the Council cannot be advised to incur the responsibility and risk which under clause 6 might perhaps be serious, of expending money of the Association on anything which is not so specified and is not clearly similar to some of the things which are so specified, and consequently that the Council cannot be advised to expend money for any of the purposes referred to in the case.

(Signed)

JOHN DIXON.

May 16th, 1895.

11, New Square, Lincoln's Inn.

Resolved: That the General Secretary be instructed to communicate the result of counsel's opinion to the Civil Rights Defence Committee.

Read letter from Dr. Warner, Honorary Secretary to the Committee on the Mental and Physical Condition of School Children.

Resolved: That the consideration of the letter be postponed until the reappointment of the Committee at the annual meeting.

Read letter from Mr. F. G. Parsons asking permission to invite three anatomists who are not members of the Association to take part in the proceedings of the Section.

Resolved: That the permission of the Council be granted to the Section to invite the three gentlemen who are not members to take part in the proceedings.

Read letter from the Honorary Secretaries to the annual meeting, of which the following is a copy.

11, Chandos Street, Cavendish Square, W.,
June 16th, 1895.

Dear Sir,—We beg to enclose resolution passed at a meeting of the Executive Committee held yesterday, and shall be obliged if you will bring it before the Council of the Association in due course.—We are, yours faithfully,

ANDREW CLARK, } Hon. Secs.
ISAMBAUD OWEN, }

Francis Fowke, Esq.

That it be suggested to the Council of the Association that members of the Council and officers of the Association and of the annual meeting should be asked to wear academic dress at the Association Service in St. Paul's.

Moved by Mr. Andrew Clark, seconded by Dr. Crocker:

"That members be requested to wear academic dress on the occasion of the service at St. Paul's Cathedral."

The motion having been put from the chair the same was declared to be lost.

Resolved: That the question of the Council of the Association wearing a distinctive badge at the annual meeting be referred to the Executive Committee.

Read applications for rooms from the Irish Graduates' Association, Foreign Medical Missions, the Association of Certifying Surgeons, and the Medical Students Assurance Society.

Resolved: That the usual permission be given to these Societies to hold their meetings at a convenient time to as not to interfere with the meetings of the Association.

Resolved: That 170 of the 171 candidates whose names appear on the circuit concerning the meeting together with the 58 of the 59 on the supplemental list, be and they are hereby elected members of the British Medical Association.

The consideration of the application of two of the candidates was postponed till the next meeting of the Council.

Read minutes of the General Practitioners Committee together with Interim Report.

The Interim Report was then considered and after considerable discussion it was moved and seconded:

"That the minutes of the General Practitioners Committee of May 23rd, June 20th, and July 4th, together with the Interim Report (see page 200) be received, approved, and the Interim Report of the Committee published in the JOURNAL for presentation to the annual meeting.

Whereupon an amendment was moved and seconded:

"That the last paragraph of the report 'Nothing could be worse, etc.,' down to 'midwifery diplomas,' be struck out."

The amendment having been put from the chair, the same was declared to be lost.

The original motion was then put and declared to be carried, 16 voting for and 5 against.

Mr. Vincent Jackson requested that his name should be recorded as voting against the original motion as representing the views of the Staffordshire Branch.

The Annual Report of the Council was then considered.

Resolved: That the Report of the Council as amended be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 188).

Resolved: That the Report of the Parliamentary Bills Committee be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 212).

Resolved: That the Report of the Scientific Grants Committee be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 204).

Resolved: That the Report of the Committee on Legislation for Inebriates be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 211).

Resolved: That the Report of the Medical Charities Committee be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 212).

Resolved: That the Report of the Committee on Scientific Examination of School Children be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 213).

Resolved: That the Report of the Anæsthetics Committee be received, approved, and published in the JOURNAL for presentation to the annual meeting (see page 214).

Resolved: That the Report of the Therapeutic Committee be received, approved, and published in the JOURNAL for presentation to the annual meeting in London on July 30th (see page 215).

Resolved: That the Report of the Committee on the Efficient Control of Railway Servants' and Manners' Exports be received, approved, and published in the JOURNAL for presentation to the annual meeting in London on July 30th (see page 216).

Resolved: That the minutes of the Inebriates Legislation Committee of 26th June last be received and approved and the recommendations contained therein carried into effect.

Resolved: That the minutes of the Medical Charities Committee of the 9th inst. be received and approved and the recommendations contained therein carried into effect.

Resolved: That the minutes of the Printing and Library Committee of May 23rd and the 9th inst. be received and approved and the recommendations contained therein carried into effect.

Resolved: That the minutes of the Trust Funds Committee of the 9th inst. be received and approved and the recommendations contained therein carried into effect.

Resolved: That the minutes of the Scientific Grants Committee of the 4th inst. be received and approved and the recommendations contained therein carried into effect.

Resolved: That the minutes of the Parliamentary Bills Committee of the 26th inst. be received and approved and the recommendations contained therein carried into effect.

Resolved: That the minutes of the Journal and Finance

Committee of the 10th inst. be received and approved and the recommendations contained therein carried into effect.

Read resolution of the Dundee Branch, copy of which is as follows:

It was also agreed to ask the Council of the Association to definitely urge on the Pharmacopœia Committee the necessity of adopting the metric system in the forthcoming edition of the *British Pharmacopœia*.

Resolved: That a copy of the resolution be sent to the Therapeutic Committee.

The resolutions of which the following are copies were reported from the South Wales Branch, the South Midland Branch, and the Edinburgh Branch.

That this meeting is of opinion that the Council of the British Medical Association should without delay take into consideration the best way of applying a portion of the surplus funds of the Association in providing against unqualified practitioners and other persons who are in the habit of practising medicine and surgery without legal qualifications.

That a copy of this resolution be sent to the General Secretary to be placed on the agenda at the annual meeting in London.

A. SHERR.

Resolution passed by the South Midland Branch:

That the Council of the British Medical Association be urged to lose no time in investigating thoroughly and impartially the relations of medical men to dispensaries, medical aid societies, and the Poor Law authorities, with a view to advising how they shall be regulated to the greatest advantage of the country, the poor, and the profession.

Resolution passed by the Edinburgh Branch:

4, Melville Crescent, Edinburgh, Jan. 26th, 1895.
Dear Sir,—I am directed to send you copy of a motion which was passed at the annual meeting of this Branch on the 27th inst. with reference to the subject of Medical Defence. I venture to express the hope that the Council will give it its most careful consideration. I am, dear Sir, yours faithfully,

R. W. FULTON, Hon. Sec.

That it is to the interest of the public and of the medical profession that the Council of the British Medical Association should take power and authority to protect, not only the collective interests of the medical profession, but also those of the individual members of the Association, and that the Council be requested to take such steps as may be necessary to enable it actively to undertake these duties. This Branch recognises that probably these steps include an alteration in the Articles of Association and the raising of the annual subscription.

Various notices of motion which had been given for the general meeting were also reported.

BRITISH MEDICAL ASSOCIATION. SIXTY-THIRD ANNUAL MEETING.

By a by-law of the British Medical Association all communications to the Association are the property of the Association. Applications from other journals for copies of papers or abstracts should therefore be referred to the Editor of the British Medical Journal.

The sixty-third Annual Meeting of the British Medical Association will be held in London on Tuesday, Wednesday, Thursday, and Friday, July 30th, 31st, August 1st and 2nd, 1895.

President: F. LEQ. FOX, M.D., F.R.C.P., Consulting Physician to the Bristol Royal Infirmary.

President Elect: Sir J. RUSSELL REYNOLDS, Bart., M.D., F.R.C.P., F.R.S., President of the Royal College of Physicians.

President of the Council: J. WARD COUSINS, M.D., F.R.C.S., Senior Surgeon to the Royal Portsmouth Hospital.

Treasurer: HENRY TRENTHAM BUTLIN, F.R.C.S., D.C.L., Surgeon to St. Bartholomew's Hospital, E.C.

An Address in Medicine will be delivered by Sir WILLIAM BROADBENT, Bart., M.D., F.R.C.P., Physician-in-Ordinary to H.R.H. the Prince of Wales.

An Address in Surgery will be delivered by JONATHAN HUTCHINSON, F.R.S., F.R.C.S., Consulting Surgeon to the London Hospital.

An Address in Physiology will be delivered by EDWARD ALBERT SCHAEFER, F.R.S., Jodrell Professor of Physiology, University College.

The Scientific Business of the Meeting will be conducted in Fifteen Sections, as follows, namely:

A. MEDICINE.

Lecture Theatre—Conjoint Examination Hall.

President: F. W. PAVY, M.D., F.R.S. **Vice-Presidents:** Sir FREDERICK BATEMAN, M.D.; D. W. FINLAY, M.D.; W. S. CHURCH, M.D.; J. W. MOORE, M.D.; STEPHEN MACKENZIE, M.D.; E. MARSHAM SKERRITT, M.D. **Honorary Secretaries:** WILLIAM COLLIER, M.D., St. Mary's Entry, High Street, Oxford; W. P. HERRINGHAM, M.D., 18, Upper Wimpole Street, W.; Sir HUGH R. BRAYOR, M.D., 18, Serjeant's Inn, Fleet Street, E.C.

Wednesday, July 26th.

10 A.M. Opening Remarks by the President.

10.15 A.M. Discussion on Diphtheria and its Treatment by the Antitoxin (embracing the following points: (1) Pathology of Diphtheria and its Sequelae; (2) Symptoms and Progress; (3) Statistics of Mortality under the Antitoxin Treatment and under other Treatment; (4) Effect of the Antitoxin Treatment upon the Local Affection, upon the General Condition, and upon the Sequelae; (5) Effects that may arise from the Antitoxin Treatment). Introduced by Sidney H. C. Martin, M.D. The following also intend to join in the discussion: G. Sims Woodhead, M.D.; E. W. Goodall, M.D.; Claude Muirhead, M.D. (if possible); Alex. Johnston, M.D.; Professor von Ranke; Lennox Browne, F.R.C.S.; W. P. HERRINGHAM, M.D.; J. Campbell Hall, M.B.; W. Squire, M.D.

12.15 P.M. Papers by:

DRENON, R.D., JAMES, M.D. On Ataxic Paraplegia (Clinical Varieties and their Pathology).
BRAYOR, H. R., M.D., and HOSKIN, V., F.R.S. On the Pathology of severe Ataxiosis (Two Cases treated by Operation on the Cerebrum).
TIMPFIELD, T. W., M.D. A Case of Goitrous Dyspnea.
MURRAY, George, M.D. Note on the Progress and Present Condition of the First Case of Myxedema treated by Thyroid Extract.
WEST, Samuel, M.D. On the Treatment of Diabetes Mellitus by Uranium Nitrate.
HARVEY, Professor. Notes sur le Diabète Bronzé.
CAMPELL, Colin, M.R.C.S. Notes on Direct Intrapulmonary Medication.

And, should there be time available:

BETHUNE, William, M.R.C.S. Notes on the Influence of Heredity in Insane.
TAYLOR, Seymour, M.D. On the Connection between Chlorosis and Gastric Ulcer.
ALDRIDGE, F. H., M.D. Latent Ulcer of the Stomach.
JONES, E. Lloyd, M.D. Chlorosis.

Thursday, August 1st.

10 A.M. Discussion on Acute Lobar or Croupous Pneumonia, its Etiology, Pathology, and Treatment. Introduced by R. Douglas Powell, M.D. The following points will be suggested for special consideration:

Local.—1. How far chill arising from (a) low external temperature, (b) sudden change of external temperature, is causative of pneumonia. 2. How far the reception of a microbe is alone to be regarded as a sufficient cause of pneumonia. 3. How far pneumonia is a disease brought about by conditions favourable to the aggressive germination of an organism ever more or less present. 4. In what does septic or pythogenic pneumonia differ etiologically from the classical form of the disease? 5. Is infection a possible or considerable agency in the propagation of pneumonia?

Pathological.—Climate or minute pathology. 1. (a) A necrosis. 2. (c) A direct result of microbial toxins upon the lung parenchyma. 3. (f) The rôle of leucocytosis in pneumonia.

Therapeutical.—1. The value of a routine treatment in cases of moderate degree and favourable omen. 2. The value of certain modern methods and the indications for their employment. Pyrexia, the cardiac state, and microbial conditions will especially be held in view in discussing points of treatment.

The following gentlemen will join in the discussion: J. W. Washburn, M.D.; A. G. Auld, M.D.; Julius Dreschfeld, M.D.; J. E. Pollock, M.D.; A. Foxwell, M.D.; W. J. Tyson, M.D.; G. W. Ballour, M.D.; A. Barra, M.D.; Professor Dabinett (Freiburg); Professor Clifford Allbutt; Samuel Barton, M.D.; Sidney Coupland, M.D.; Samuel J. Gee, M.D.; G. A. Gibson, M.D.; Walter G. Smith, M.D.; Sir T. Grainger Stewart, M.D.; McCall Anderson, M.D.; Sinclair Coghill, M.D.; Lovell

Drage, M.D.; David Finlay, M.D.; T. H. Green, M.D.; F. Hawkins, M.B.; D. B. Loe, M.D.; H. McCare, M.D.; F. M. Pope, M.D.; E. Marshaam Skerritt, M.D.; Huntington Smith, M.D.; J. E. Squire, M.D.; William Squire, M.D.; W. R. Thomas, M.D.; and Samuel West, M.D.

12.30 P.M. Papers by:

CORRIE, J. Macleair, M.D. The Hypodermic Use of Gonococcal in Acute Primary Tumor-ulcers.
FOXWELL, Arthur, M.D. Hypertrophic Cirrhosis of the Liver.
MARGALLI, Professor. Sur le Traitement de la Tuberculose Pulmonaire avec la Serotherapie Specifique.
SQUIRE, J. E., M.D. Influence of the Biliary Theory of Tuberculosis on the Treatment of Pathosis.
HARVEY, George, M.D., F.R.S. On the Formation of Calculi, particularly of Gall Stones.

And, should there be time available:

LOVEY, J. A., M.D. The Use of Alcoholic Stimulants and their Relation to True Physiological Health.
GILLIES, H. Cameron, M.D. The Natural History of Pain.
LASK, Hugh, L.R.C.P. Chronic Rheumatic Arthritis: further points in differentiation from Chronic Rheumatoid Arthritis.

Friday, August 2nd.

10 A.M. Discussion on the Causes of Acute Rheumatism and its Relation to other Affections. Introduced by W. B. Cheadle, M.D. The following will join in the discussion: Archibald Garrod, M.D.; J. F. Goodhart, M.D.; Alfred Mantle, M.D.; J. T. MacLagan, M.D.; A. Newholme, M.D.; P. G. Latham, M.D.; H. Handford, M.D.; Sir Dyce Duckworth, M.D.; A. Haig, M.D.; T. Churton, M.D.; H. Lane, M.D.; M. K. Hargreaves, M.D.; H. A. Caley, M.D.; H. Charteris, M.D.; Samuel West, M.D.; Stephen Mackenzie, M.D.; Gilbert Bannatyne, M.D.; A. F. Luff, M.D.; D. E. Lee, M.D.

12 noon. Papers by:

SEMMOLA, Professor. Sur la Toxicité des urines dans son degré et dans son nosographie comme élément de diagnostic et de pronostic dans les maladies en général, et surtout dans les maladies aiguës infectieuses.
MORISON, Alexander, M.D. The Treatment of Acute Valvular Disease.
CATON, R., M.D. On the Arrest of Endocarditis in Acute Rheumatism.
THORNE, Bealy, M.D. On Certain Changes in the Cardio-vascular System which follow treatment by the Shott Method.

And, should there be time available:

REYNOLDS, E. S., M.D. A Point in the Diagnosis between Chronic Rheumatism and Chronic Gout.
PARSONS, Alfred, M.D. Arsenical Multiple Neuritis following the Application of a Cancer Cure.
LAPPAN, F., M.D. Differential Diagnosis in Malignant Endocarditis, Typhoid Fever, and Acute Tuberculosis.

B. SURGERY.

Central Room, Second Floor—Conjoint Examination Hall.

President: Sir WM. MAC CORMAC, F.R.C.S. **Vice-Presidents:** T. BRYANT, F.R.C.S.; O. N. MACNAMARA, F.R.C.S.; REGINALD HARRISON, F.R.C.S.; A. WILLETT, F.R.C.S.; Sir W. STOKES, M.D.; MAYO ROBSON, F.R.C.S. **Honorary Secretaries:** J. D. HARRIS, M.R.C.S., 45, Southwark; Exeter; J. BLAND SUTTON, F.R.C.S., 48, Queen Anne Street, W.; A. MARMADUKE SHIELD, F.R.C.S., 4, Cavendish Place, Cavendish Square, W.

PROVISIONAL AGENDA.

Wednesday, July 25th.

10 A.M.—Introductory Remarks by the President: Some Points in connection with the Surgery of War. (Lantern Demonstration).

10.15 A.M. KIRKMAN, Brigade Surgeon—Lieutenant Colonel D. F., M.D. Rhinoplasty in India (Lantern Demonstration).

The following subjects have been selected for discussion:

1. The Diagnosis and Treatment of Fractures of the Upper Third of the Femur, including the Neck. To be introduced by Sir William Stokes, M.D., with lantern demonstration. The following gentlemen have intimated their intention of taking part in the discussion: Professor E. H. Bennett, M.D. (Dublin); Thomas Bryant, F.R.C.S. (London); Professor Chiene, M.D. (Edinburgh); H. H. Clutton, F.R.C.S. (London); J. Ward Cousins, M.D., F.R.C.S. (Portsmouth); James Colley, F.R.C.S. (London); James Harrison, F.R.C.S. (Liverpool); Sir George Murray Humphrey, M.D., F.R.S. (Cambridge); Robert Jones, F.R.C.S. (Liverpool); Mansell Moullin, F.R.C.S. (London); Howard Mason, F.R.C.S. (London); Professor MacEwen, M.D., F.R.S. (Glasgow); Rudolph Parker, F.R.C.S. (Liverpool); Mayo Robson, F.R.C.S. (Leeds); Thos. Sinclair, M.D. (Belfast); F. A. Southam, F.R.C.S. (Manchester); Greig Smith, M.B. (Bristol); A. Willett, F.R.C.S. (London).

1.45 P.M. FRANKS, Kendal, M.D. On Movable Kidney. (Lantern Demonstration.)

Thursday, August 1st.

10 A.M. MARSH, HOWARD, F.R.C.S. The Pathology and Clinical History of some Rare Forms of Bony Ankylosis.

10.30 A.M. BROWN, G. Jackson, M.R.C.S. A Hitherto Undescribed Locality in the Male Urinary Bladder where a Stone may lie and elude contact with any instrument introduced through the Urethra.

11 A.M. NEWMAN, W. M.D. Local. Symmetrical Necrosis of the Lower Third of Each Femur: Large Removal of Bone; Ultimate Amputation through the Left thigh; Recovery.

11.30 A.M. 2. The Surgical Treatment of Cysts, Tumours, and Carcinoma of the Thyroid Gland and Accessory Thyroids. To be introduced by H. Trentham Butlin, F.R.C.S. (London). The following gentlemen have intimated their intention of taking part in the discussion: Professor Annandale, F.R.C.S. (Edinburgh); James Berry, F.R.C.S. (London); Gilbert Barling, F.R.C.S. (Birmingham); J. Paul Bush, M.R.C.S. (Bristol); Thos. F. Chavasse, M.D. (Birmingham); R. G. Chicken, F.R.C.S. (Nottingham); Kendal Franks, M.D. (Dublin); Damer Harrison, F.R.C.S. (Liverpool); Victor Horsley, F.R.S. (London); Bowreman Jessell, F.R.C.S. (London); O. B. Keetley, F.R.C.S. (London); Professor Kocher (Berne); Dr. Kummer (Geneva); Jordan Lloyd, F.R.C.S. (Birmingham); R. H. Lucy, F.R.C.S. (Plymouth); Professor W. Macewen, M.D. (Glasgow); Rutherford Morison, F.R.C.S. (Newcastle-on-Tyne); James Murphy, M.D. (Sunderland); Mayo Robson, F.R.C.S. (Leeds); W. G. Spencer, F.R.C.S. (London); Sir William Stokes, M.D. (Dublin); Charters Symonds, M.D. (London); Thelwall Thomas, F.R.C.S. (Liverpool).

Friday, August 2nd.

10 A.M. HENLEY, Victor, F.R.S. The Results of Operative Treatment of Injury or Disease of the Cervical Vertebrae.

10.30 A.M. HARRIS, Mitchell, F.R.C.S. The Statistics of Modern Breast Operations.

11 A.M. MURPHY, J. B. M.D. (Chicago). Peritonitis.

12 noon. MORTON, Chas. A., F.R.C.S. Specimen showing the Junction made by Murphy's Button, Three Months after Operation, in the Case of Intestinal Ankylosis published in the BRITISH MEDICAL JOURNAL, April 24th, 1896.

12.15 P.M. ROSSON, A. W. Mayo, F.R.C.S. A Series of Cases of Colectomy.

12.30 P.M. CRIPPS, Harrison, F.R.C.S. A Complication occurring in Inguinal Groin.

1 P.M. ANDERSON, William, F.R.C.S. Three Cases of Sacless Hernia of the Inguinal Region through the Left Inguinal Canal, with Anatomical Specimen.

1.30 P.M. STANTON, W. Dunnett, F.R.C.S. Edin. On Splenectomy, with Notes of Three Cases.

CATHCART, Charles, F.R.C.S. On a Simple Form of Exhaust Pump for Use after Suprapubic Cystostomy.

CHAVASSE, Thos. F., M.D. A Successful Case of Removal of the Entire Upper Extremity for Injury by Berger's Method.

CHRYSLER, Watson, F.R.C.S., F.R.S. On Operations for Malignant Disease of the Pharynx and Naso-pharynx, with Cases.

EVE, Frederick S., F.R.C.S. A Successful Case of Laparotomy for Intussusception in an Infant, with Remarks.

FENWICK, Harry, F.R.C.S. A Series of Seventy Cases of Ablation of Tumours of the Bladder.

HEM, John, M.D., F.R.C.S. Some Points in the Operative Treatment of Club Foot.

KENTLEY, C. B., F.R.C.S. On Thirty Cases of Osteotomy of the Hip, with Cases.

LITTLE, E. Muirhead, F.R.C.S. Tarsectomy for Talipes Equinus in Adults and Adolescents.

LLOYD, Jordan, F.R.C.S. 1. On Gonorrhoeal Inflammation in and about the Seminal Vesicles. 2. On a Simple Method of Securing the Tongue during Lingual Operations.

LOCKWOOD, C. B., F.R.C.S. On the Treatment of Hydrocele by Incision.

MORISON, Albert E. Notes on a Case of Jacksonian Epilepsy Treated by Trephining.

MURPHY, James, M.D. On the Importance of Operating Early where an Operation is required in Abdominal Disease.

PAGET, Stephen, F.R.C.S. Two Cases of Suppurating Hydatid of the Liver drained through the Chest Wall.

SPENCER, W. G., M.D. On Movable Liver.

WATSON, Spencer. A Case of Tachycardia Associated with Nasal Growths.

WILSON, Albert, M.D. The Treatment of Acute Pleural Effusion by Early Incision.

Dr. Stoker will give a demonstration of the Oxygen Treatment of Wounds and Ulcers in a room provided for the purpose at King's College; the day and hour will be announced in the Daily Journal.

C. OBSTETRICS AND GYNÆCOLOGY.

Large Theatre—King's College.

President: Sir WM. PRIESTLEY, M.D. Vice-Presidents: A. R. SIMPSON, M.D.; J. WATT BLACK, M.D.; Sir FRANCIS LAXING, M.D.; J. KNOWLEY THORNTON, M.B.; W. J. SINGLAIN, M.D.; M. HANDFIELD-JONES, M.D. Honorary Secretaries: W. S. A. GRIFFITH, M.D., 96, Harley Street,

W.; A. H. F. BARBOUR, M.D., 4, Charlotte Square, Edinburgh; W. R. DAKIN, M.D., 87, Welbeck Street, W.

The following subjects have been selected for discussion: The work of the Section has been provisionally arranged as follows:

Wednesday, July 31st:

10 A.M. President's Address. 10.30. Discussion: The Aseptic and Antiseptic Precautions to be Observed in Private Midwifery Practice, to be introduced by G. E. Herman, M.B., F.R.C.P. The following gentlemen are expected to take part in this discussion: Dr. Stuart (Brooklyn), Professor Lusk (New York), Dr. Smyly, Professor Simpson, Dr. Swayne, Dr. Playfair, Professor Byers, Dr. More Madden, Dr. Watt Black, Professor Murdoch Cameron, Dr. Aust-Lawrence, Dr. Boxall, Dr. Forbes Ross, and others.

Papers by:

AROSTOLI, Dr. (Paris). On Electro-therapeutics as a Means of Diagnosis in Gynecology.

MADDEN, More, M.D. (Dublin). Gonorrhoeal Infection in some of its Gynecological Aspects.

MURPHY, James, M.D. (Sunderland). The Surgical Treatment of so-called Puerperal Fever.

Thursday, August 1st:

10 A.M. Papers by:

MARTIN, Professor (Berlin). Anterior Colpotomy.

TAYLOR, J. W., F.R.C.S. (Birmingham). Vaginal Collootomy.

DONALD, A. M.D. (Manchester). A Case of Vaginal Collootomy for Tubal Pregnancy.

PLAYFAIR, W. S., M.D. (London). Remarks on the Education and Training of Girls at and about the Period of Puberty.

SWANSEY, J. G., M.D. (Clifton). The Treatment of Eclampsia occurring during Pregnancy, and Presenting no Signs of Labour.

Instruments will be shown by Professor Lazarewitch (St. Petersburg), Mr. E. Stanmore Bishop (Manchester), and by Dr. Laffan (Cashel).

Specimens will be shown by Dr. Muret (Lausanne).

Friday, August 2nd:

10 A.M. Discussion: The Early Diagnosis of Malignant Disease of the Uterus, and the Treatment by Partial or Total Excision, to be introduced by J. Knowley Thornton, M.B.

The following gentlemen are expected to take part in this discussion: Professor Martin (Berlin), Professor Pozzi (Paris), Professor Lusk (New York), Mrs. Scharlieb, M.D. (London), Professor Murdoch Cameron, Dr. More Madden, Dr. Murphy, Dr. Smyly, Mr. J. W. Taylor, Dr. A. Donald, Mr. Alban Doran, and others.

Papers by:

CAMERON, Professor Murdoch (Glasgow). A New Theory as to the Position of Fetus in Utero.

BARBOUR, A. H. Freeland, M.D. (Edinburgh). The Changes in the Uterus during the Third Stage of Labour.

JESSETT, F. B., F.R.C.S. (London). A New Method of Performing Abdominal Hysterectomy for Uterine Fibroids.

DONALD, A. M.D. (Manchester). Vaginal Hysterectomy for Fibroids.

FRASER, J. Hosack (Bridge of Allan). Notes on a case of Uterine Cystic Fibroma.

The following papers have also been received, and will be read if time permits:

HAMPTON, A. H., M.D. (Hikley, Leeds). Cases of Concealed Hemorrhage, Placenta Praevia, and Puerperal Eclampsia.

BELL, R., M.D. (Glasgow). The Use of Ichthyol in the Treatment of Diseases of the Uterine Appendages.

CAMERON, Professor Murdoch (Glasgow). Exceptional Gynecological Experiences.

EDGE, F., M.D. (Wolverhampton). Radical Cure of Uterine Prolapse.

ROBERTS, Lloyd, M.D. (Manchester). Case of Tumour of the Fallopian Tube.

NAIRNE, Stuart, F.R.C.S. (Glasgow). Influence of Pregnancy on Uterine Fibroids.

NAIRNE, Leith, M.D. (London). Some Complication of the Menopause.

NEWHAM, W. H. C. M.B. (Clifton). Sterility.

TREVELLYAN, Basil, M.B.C.S. (Bath). Labour in Young Primiparae.

D. PUBLIC MEDICINE.

Lower Hall—Exeter Hall.

President: ERNEST HART, D.O.L. Vice-Presidents: J. SPOTTISWOODE CAMERON, M.D.; O. H. W. PARKINSON, M.R.C.S.; WM. COLLINGRIDGE, M.D.; LOUIS C. PARKES, M.D.; P. BOOBYER, M.D.; JOHN O. THURSH, M.D. Honorary Secretaries: C. E. PAGET, M.R.C.S., Town Hall, Salford; REGINALD DUDFIELD, M.B., Sanitary Department, Vestry Hall, Hartow Road, Paddington, W.; F. W. CLARK, M.B., Lowestoft.

The regular business of the Section will commence each day with a formal discussion by gentlemen who have been invited to open the debates. The subjects selected are as follows:—

Wednesday, July 31st.—Presidential Address: Waterborne Disease and its Prevention. Discussion: The Regulation of the Slaughter of Animals for Human Food and the Inspection of Animals before and during Slaughter. Opener: T. M. Lodge, M.D.

Papers by:

FARRAR, Dr. (Buda-Pesth). The late Visitation of Cholera in North-Hungarian Districts of Hungary.
LAW, J. PARRY, F.R.C.S., and J. T. NEEBON, L.R.C.P. Ventilation of sewers.

WALSH, F. J., M.D., and WALSH, D., M.B. Underground Workshops.
JENNISON, G. V., M.D. Dry Method of Dealing with Urine.
HISLOP, R. M.D., PRINGLE, R., M.D., and GRAHAM, W., M.D. Smoke Abatement.

Thursday, August 1st.—Discussion: Hospital Isolation, House Quarantine, and Disinfection. Opener: P. Boobyer, M.D.

Papers by:

KIMES, Professor, F.R.S. and BROWN, Hermann, M.D. Diagnosis of individual cases of Diphtheria and the use of Bacteriology for that purpose.

BROWN, Hermann, M.D. Use of Antitoxin for Immunising Members of Institutions.

NEWBOLD, A., M.D. Extension of Schedule of Notification.
CHRISTLEY, J., M.D. Enteric Fever as an Infectious Disease.
KENWOOD, H., M.B. Prevention of Milk Epidemics.
DIXON, F. A., M.D. Vital Statistics of Diphtheria, 1891-5.
BRADWOOD, P. M., M.D., and GREGORY, A. J., M.D. Hospital Accommodation by use of ships.

Friday, August 2nd.—Discussion: The Insecurity of Tenure of Extra-Metropolitan Medical Officers of Health under the Public Health Act, 1875. Opener: B. A. Whitelegge, M.D.

Papers by:

MUNRO, A. Campbell, M.B. The Need of Appointing Medical Officers of Health to County Councils.

PARKES, Louis, M.D. The Desirability of Appointing Medical Men as Superintendent Registrars of Births and Deaths.

CAMERON, J. Spottiswoods, M.D. The Destruction of Town Refuse by Heat.

SQUANCE, T. G., M.D., and KENWOOD, H., M.D. Meteorology and Disease.

GRAHAM, W., M.D., and HORDER, T. G., M.D. The Vaccination Laws.
LAPPAN, T. M.R.C.S. Extension of the Army Competitive System to the Irish Poor-Law Medical Service.

Owing to the amount of work to be done, readers of papers will be rigidly limited to fifteen minutes, and all other speakers to ten minutes. The names of those who have signified their intention to speak will be announced in the Daily Programme.

E. PSYCHOLOGY.

East Wing Room, Second Floor—Conjoint Examination Hall.

President: W. JULIUS NICKLE, M.D. **Vice-Presidents:** G. H. SAVAGE, M.D.; T. CLAYE SHAW, M.D.; D. NICOLSON, M.D.; HENRY RAYNER, M.D.; J. G. McDOWALL, M.D.; LIONEL A. WEATHERLY, M.D. **Honorary Secretaries:** JAMES CHAMBERS, M.D., 6, Mansfield Street, W.; T. SNYMOUR TURE, M.B., 37, Albemarle Street, W.; JAMES TAYLOR, M.D., 24, Welbeck Street, W.

The following arrangements have been made for the work of this Section, and the programme here given will be adhered to as closely as circumstances will permit:

The President will open the Section with an Address on the Brain, on Wednesday, at 10 A.M.

A discussion has been arranged to take place on each day, namely:

Wednesday, July 31st.

On the Treatment of Melancholia, introduced by Henry Rayner, M.D. The following are expected to take part in the discussion: Dr. Blandford (London); Dr. Weatherly (Bath); Dr. Norman Kerr (London); Dr. Cooke (Worcester); Dr. Hayes Newington (Titchhurst); Dr. Hyalop (London).

The following papers will then be read and discussed:

MUNRO, A., L.R.C.P. Mental Symptoms in Relation to Exophthalmic Goitre.
REYNOLDS, E. S., M.D. Mental Symptoms of Bodily Diseases.
HEAD, H., M.D. Mental Symptoms in Relation to Bodily Diseases in the Brain.
SHUTTLEWORTH, E., M.D. Operative Treatment of Idiocy.

Thursday, August 1st.

On Insanity in Relation to Criminal Responsibility, introduced by H. Mandaley, M.D. The following have intimated their intention of taking part in this discussion: Professor Gairdner (Glasgow); Dr. Orange, C.B. (London); Dr. Unruh (Perth); Dr. Norman Kerr (London); Dr. Weatherly (Bath);

Dr. Savage (London); Dr. Clouston (Edinburgh); Dr. Mercier (London); Dr. Shuttleworth (London).

Also the following papers:

SAVAGE, G. H., M.D., and CHARLES MERCIER, M.D. Insanity in Conduct.
CAMPELL, A. W., M.D. A Comparison of the Breaking Strain of Ribs in the Sane and Insane.
FOX, Bonville B., M.D. A Medico-Legal Case.
CAMPELL, Harry, M.D. Morbid Doubt.

Friday, August 2nd.

On Epilepsy, and its Relation to Insanity, introduced by W. R. Gowers, M.D. The following are expected to take part in this discussion: Professor Sir T. Grainger Stewart (Edinburgh); Dr. Buzzard (London); Dr. Clouston (Edinburgh); Dr. Dreschfeld (Manchester); Dr. Ferrier (London); Dr. Fletcher Beach (London).

Also the following papers:

BOND, C. H., M.B. The Relation of Diabetes to Insanity.
SMITH, Perry, M.D. Voluntary Boarders in Asylums.
WEATHERLY, L. A., M.D. The Law in Relation to Single Patients.
SHAW, James, M.D. The Early symptoms of Insanity.
HUGHES, Dr. C. H. (St. Louis, U.S.A.) will show a Model of the Brain.

In addition to those enumerated above, the following gentlemen are also expected to participate in the work of the Section: Dr. P. W. Macdonald (Dorchester); Dr. Macphail (Derby); Dr. Henry Blake (Yarmouth); Dr. Outtersen Wood (London); Dr. Hicks (London); Dr. Wiglesworth (Rainhill).

F. PHYSIOLOGY.

Physiological Laboratory and the adjoining Theatre of Anatomy—King's College.

President: DAVID FERRIER, M.D., F.R.S. **Vice-Presidents:** E. E. KLEIN, M.D., F.R.S.; WM. STYRLING, M.D.; DR. BURGH BIRCH, M.D.; J. BERRY HAYCRAFT, M.D. **Honorary Secretaries:** C. S. SHERRINGTON, M.D., F.R.S., Brown Institution, Wandsworth Road, S.W.; E. H. STARLING, M.D., 107, Clifton Hill, N.W.

The work of the Section has been arranged as follows:

Wednesday, July 31st.

10 A.M. Introductory remarks by the President.

10.30 A.M. to 2 P.M. The following communications will be given, accompanied for the most part by demonstrations:

BIRCH, Professor de Burgh, M.D. On the Equipment of an Experimental Laboratory, with Exhibition of Apparatus.
RIVERS, W. H. R., M.D. On Some Reaction Time Apparatus.
EDRIDGE-GREEN, F. W., M.D. On the Perception of Luminosity at Different Parts of the Retina.
MARINISCO, Dr. On Tertiary Atrophy and Degeneration of the Central Nervous System.

TURNER, W. Aldren, M.D. (1) The Results of Lesions of the Tuberculum Rolandi. (2) The Results of Section of the Trigeminal Nerve and the Consequent Degenerations.

TURNER, Aldren, M.B. Demonstration of Several Recently Described Tracts in the Brain and Spinal Cord.

KENT, A. F. Stanley. On Outlying Cells in the Optic Chiasma and in the Optic Tracts.

HUNTER, William, M.D. Experiments relating to the Functions of the Spleen.

SHERRINGTON, C. S., M.D., F.R.S. The Sensorial Apparatus of Muscles.

Thursday, August 1st.

Discussion on the Mechanics of the Cardiac Cycle, to be introduced at 10 A.M. by Professor J. Berry Haycraft, M.D., and D. Paterson, M.D. The following gentlemen have announced their intention to join in the discussion: Dr. Noel Paton, Dr. Lander Brunton, F.R.S.; and Dr. Gibson.

The following communications will be given, accompanied for the most part by demonstrations:

REYMAN, Professor. Innervation du Cœur.
BAYLES, W. M., B.A., B.Sc., and Professor I. HILL. The Physics of the Cerebral Circulation.

BAYLES, W. M., B.A., B.Sc., and E. H. STARLING, M.D. A New Method of Studying Vasomotor Changes.

STEWART, Professor G. N. Further Researches on Crystalline Time.

LEATHES, T. B., F.R.C.S. On the Interchange of Fluid between the Blood and the Tissues.

CAMPBELL, Harry, M.D. The Resistance which the Capillaries offer to the Blood Flow.

Friday, August 2nd.

The following communications will be given, illustrated for the most part by demonstrations:

STEVENS, Professor. The Influence of Sugar on Muscular Work.

HARLEY, VAUGHAN, M.D. Sugar as a Muscular Food.

ROBERT, T. GEORGE, M.D. The Work of Muscles.

REYMAN, Professor. Sur les Echanges Nutritifs pendant l'Insomnie.

FERGUSON, M. S., M.R. The Physiology of Heat Regulation.

HALLIDAY, Professor, M.D., F.R.S. Nutrition.

FICKER, J. W., M.D. Intravascular Coagulation produced by Synthesised Protein-like Substances.

RAMSDEY, W. I. R.C.P. Mechanical Coagulation of Proteids.
BRIDGER, T. GREGOR, M.D. Decomposition Products from Gelatine and Collagen.
ECCLES, SYMONS, M.B. The Incidence of Leucocytosis in the Urine in Rheumatism and Gout.

G. ANATOMY AND HISTOLOGY.

(Chemical Theatre—King's College.)

President: HENRY MORRIS, F.R.C.S. **Vice-Presidents:** A. MACALISTER, M.D., F.R.S.; W. J. WALSHAM, F.R.C.S.; A. H. YOUNG, F.R.C.S.; B. C. A. WINTLE, M.D.; G. H. MAKINS, F.R.C.S.; A. W. HUGHES, F.R.C.S. **Honorary Secretaries:** F. C. PARSONS, F.R.C.S., St. Thomas's Hospital, S.E.; C. B. LOCKWOOD, F.R.C.S., 19, Upper Berkeley Street, W.

Wednesday, July 31st.—10. A.M. Opening remarks by the President. 10.15 A.M. Discussion: Art in its Relation to Anatomy, to be opened by Professor William Anderson, F.R.C.S., Joint Lecturer on Anatomy at St. Thomas's Hospital, Professor of Anatomy in the Royal Academy of Arts. 11.30 A.M. PAPER, J. F. M.D. On an Early English Anatomical Manuscript of the 14th Century. (Some old anatomical works will be exhibited by Mr. Payne and Professor Anderson.)

12 NOON. WINTLE, Professor. Note on the Eustachian Tube.
Thursday, August 1st.—10 A.M. Discussion: The Development and Structure of the Placenta, to be opened by Professor A. H. Young, M.B., F.R.C.S., Professor of Anatomy at Owens College, Manchester.

11 A.M. ROBINSON, A. M.D. Demonstration of the Structure of the Placenta in Carnivora and Rodentia.
11.30 A.M. KENT, A. F. Stanley, M.A. On the Histology of the Generative Organs in a Hemorrhoided Frog.

12 NOON. GRIFFITHS, J. M.A., F.R.C.S. On the Anatomy of the Genito-urinary Apparatus in the Pig and Boar, with Remarks on the Effects of Castration.

12.30 P.M. SMITH, T. Manners, B.A., M.R.C.S. (1) On some points in the Anatomy of Three Egyptian Mummies; (2) Notes upon the Supernumerary Elements of the Embryonic Hand and Foot.

Friday, August 2nd.—10 A.M. Discussion: The Topographical Anatomy of the Abdomen, to be opened by Professor A. Thomson, M.A., Professor of Anatomy at Oxford University.

11.15 A.M. PATTERSON, Professor A. M., M.D. On the Position of the Kidneys.

11.45 A.M. KEITH, A., M.D. On Synostosis of the Menosternum to the Fræsternum in Man and Anthropoids, considered as to its Prevalence among them and its Value as Evidence of their Genetic Relationship.

12 NOON. STOKER, Mr. Graves. On Floating Liver. (A specimen will be shown.)

1.30 P.M. HIGGINS, H., M.R.C.S. On the Mechanism of the Knee-joint.

H. PATHOLOGY AND BACTERIOLOGY.

South Room, Ground Floor—Conjoint Examination Hall.

President: SAMUEL WILKS, M.D., F.R.S. **Vice-Presidents:** J. M. PURSER, M.D.; J. F. GOODHART, M.D.; SIDNEY COUPLAND, M.D.; R. SAUNDY, M.D.; W. WATSON CHEYNE, F.R.C.S.; ANTHONY A. BOWLEY, F.R.C.S. **Honorary Secretaries:** S. G. SHATTOCK, F.R.C.S., St. Thomas's Hospital, S.E.; H. D. ROLLESTON, M.D., 13, Upper Wimpole Street, W.

The work of the Section has been arranged as follows:

Wednesday, July 31st.

10 A.M.—Introductory Remarks by the President.

10.30 A.M.—Demonstration of the Malaria Parasite by P. Manson, M.D., with Some Facts as to its Life-history. (Illustrated by Lantern Slides.) A discussion will follow, in which it is hoped the following will take part: Professor Crookshank; A. A. KANTHACK, M.D.; and G. THIN, M.D. (who will give a demonstration before the discussion).

11.15 A.M.—A. Foxwell, M.D., on Exophthalmic Goitre; G. R. MURRAY, M.D., Some Results of Thyroidectomy.

11.45 A.M.—Mr. J. H. Targett, on Syringomyelia and Joint Disease.

12.0 NOON.—J. Risien Russell, M.D., on Congenital Defects of the Cerebellum.

12.15 P.M.—Dr. Robertson, on Arachnid Hemorrhage.

12.30 P.M.—Papers on Cancer and other New Growths. The following will read papers or take part in the discussion: R. HEWLETT, M.D., On the Chemistry of Carcinoma and Sarcoma; D'Arcy Power, F.R.C.S.; H. SNOW, M.D., The Inflammatory Marrow Infection of Breast Carcinoma; G. THIN, M.D.; Mr. T. W. BLAKE, The Occurrence of Cancer in Chalk Valleys; W. ROGER WILLIAMS, F.R.C.S., on Uterine Neoplasms and their relative frequency; Dr. Farnival, on Fungus in Malignant Diseases; E. C. BAUSFIELD, B.K.A.C.; T. N. KELYNACK, M.D.

1.45 P.M.—A. R. PARSONS, M.B., Specimen of Larynx from case of Typhoid Fever.

Thursday, August 1st.

10 A.M.—Discussion on Neuritis. Introduced by S. J. SHARKEY, M.D. The following have promised to read papers or to join in the discussion: F. W. MOTT, M.D.; W. M. ORD, M.D.; Professor TREVELYAN, M.D.; Russell Wells, M.B.; W. H. WILSON, M.B.

11.30 A.M.—Discussion on Vaccinia and Variola. Introduced by S. Monckton Copeman, M.D. It is hoped that T. D. ACLAND, M.D.; S. COUPLAND, M.D.; Professor CROOKSHANK, M.B., and others will take part in the discussion.

12.30 P.M.—Discussion on Pernicious Anæmia. Introduced by Dr. W. Hunter, and Dr. Monckton Copeman will speak.

1 P.M.—Dr. Allan MacLachlan, The Formation of Methylmercaptan on the Body and its Production by Bacteria.

1.15 P.M.—Paper by Professor ADAMI: The Effect of the Reactions of Media upon the Pathogenic Properties of Bacteria.

1.30 P.M.—Paper by A. G. AULD, M.D., on Hematogenous Jaundice.

1.45 P.M.—P. FARNIVAL, L.R.C.P., on Acromegaly.

Friday, August 2nd.

10 A.M.—Discussions on Lymphadenoma. Introduced by W. G. SPENCER, F.R.C.S. The following have intimated their intention to take part in the discussion: W. J. FENTON, M.B.; H. MORLEY FLETCHER, M.D.; R. M. LEWIS, M.B.; A. A. KANTHACK, M.D.; Mr. F. S. EVE; Mr. J. JACKSON CLARKE; C. A. MORTON, F.R.C.S.; G. N. PITT, M.D.; D'Arcy Power, F.R.C.S.; H. SNOW, M.D.; G. THIN, M.D.; CLAUD WILSON, M.D.

11.30 A.M.—Papers on Leprosy. By P. ABRAHAM, M.D.; G. THIN, M.D.

12 NOON.—Professor BAEBA.

12.15 P.M.—Professor CROOKSHANK on Actinomycosis.

12.30 P.M.—R. HEWLETT, M.D.—The Diazo Reaction in Typhoid Fever. F. F. WESTBROOK, M.D.—The Growth of the Cholera Vibrio and other Bacilli in Sunlight. R. HEWLETT, M.D., and St. Clair THOMSON, M.D.—On the Fate of Microorganisms in Inspired Air.

1.30 P.M.—F. R. WALTERS, M.D.—Pulmonary Hypertrophic Osteoarthropathy.

A. McFadyen, M.D., and R. Hewlett, M.D., will exhibit Cultures and Bacteriological Specimens.

The Secretaries venture to ask gentlemen who intend to show microscopic specimens to let them know the number of microscopes (and the powers) necessary to illustrate their papers, as this will be limited; and also to state whether the use of a lantern is required.

A separate room will be provided for the exhibition of microscopical and other specimens; lantern demonstrations will be given in the meeting-room.

I. OPHTHALMOLOGY.

Large Committee Room, Ground Floor—Conjoint Examination Hall.

President: H. POWER, F.R.C.S. **Vice-Presidents:** D. ARGYLL ROBERTSON, M.D.; W. A. BRAILEY, M.D.; G. ANDERSON CRITCHETT, M.A., F.R.C.S. Edin.; W. ADAMS FROST, F.R.C.S.; A. EMMYS JONES, M.D.; A. H. BENSON, M.B. **Honorary Secretaries:** R. W. DOYNE, F.R.C.S., Kilcorne, Oxford; E. TREACHER COLLINS, F.R.C.S., 81, Wimpole Street, W.; W. T. THOMAS SPICER, F.R.C.S., 47, Welbeck Street, W.

The following discussions have been arranged:

July 31st.—On Certain Rare Cases of Recurrent Ophthalmia. The affection occurs in adults; it begins with conjunctival and chorioid infection, general or limited, myosis, slight transient myopia, with oedema of the lids in some cases, and occasionally vesicles on the cornea. The duration varies from twenty-four hours to a few days, and recurrence takes place at varying intervals. It is probably angio-neuritic in its origin. The discussion will be opened by Professor B. LUDWIG (Vienna), and continued by G. A. BERRY, F.R.C.S. (Edinburgh), J. GRIFFITH, F.R.C.S. (London), JOHN HEMP, M.D. (Darlington), and A. EMYS JONES, M.D. (Manchester).

August 1st.—On the Diagnosis of Orbital Growths. Opened by F. F. WESTBROOK, F.R.C.S. (London); and Professor FANJA (Paris). Continued by G. A. BERRY, F.R.C.S. (Edinburgh); W.

J. Collins, M.D., F.R.C.S. (London); H.B. Griffith, M.D. (Manchester); G. Hartridge, F.R.C.S. (London); H. Macnaughton Jones, M.D. (London); H. Juler, F.R.C.S. (London); J. B. Lawford, F.R.C.S. (London).

August 2nd.—On the Question of Operating in Chronic Glaucoma. Opened by E. Nettleship, F.R.C.S. (London). Continued by G. A. Berry, F.R.C.S. (Edin.); G. Anderson Critchett, F.R.C.S. (Edin.); Adams Frost, F.R.C.S. (London); J. E. Glascock, M.D. (Manchester); John Griffith, F.R.C.S. (London); G. Hartridge, F.R.C.S. (London); H. Macnaughton Jones, M.D. (London); H. Juler, F.R.C.S. (London); G. G. Lee, M.R.C.S. (Liverpool); D. Little, M.D. (Manchester); G. Mackinlay, F.R.C.S. (Edin.); H. R. Swanzy, F.R.C.S. (Dublin); Spencer Watson, F.R.C.S. (London); R. Williams, M.R.C.S. (Liverpool); W. J. Cant, M.R.C.S. (Lincoln); A. Brunner, M.D. (Bradford); W. H. H. Jones, F.R.C.S. (London); Professor Galezowski (Paris).

The following papers have been announced:

BRANNISTON, W. M., M.R.C.S. On the question of Latent Hypermetropia in the Visual Examination of Candidates for the Public Services.
BROWN, A. H., F.R.C.S. Acromiopathy with Similar Complications.
BERRY, G. A., F.R.C.S. On Injection of Chlorine Water into the Vitreous.
HARRISON, T. M.R.C.S. (Liverpool). The Uterine Segment of the Eviscated Question in Board of Trade Official Inquiries into Shipping Disasters.
DELL, Geo. J., M.D. (Paris). Optometry by the Subjective Method.
JONAS, E., L.R.C.P. (Londonderry). Case of Acute Glaucoma occurring in a patient with Advanced Carcinoma of the Rectum.
FRANKLIN, G. W., F.R.C.S. (London). Tests for Colour Blindness.
FROST, E. A. New Theory of Erythropsia.
GRIFFITH, John, F.R.C.S. Choroidal sarcoma in Infancy.
HARRINGTON, G. F.R.C.S. Gonorrheal Staphylococci.
JONES, W. H. H., F.R.C.S. (London). Membranous Conjunctivitis.
JONES, H. Macnaughton, M.D. (London). Cases illustrative of the importance of the Correction of Errors of Refraction in Neurasthenic Vision.
JULIAN, H., F.R.C.S. (London), and HARRIS, W. J. Case of Carcinomatous Tumour of the Body of the Sphenoid causing Blindness of Both Eyes.
J. E. H. F.R.C.S. AT FEMALE, M.R.C.S. Case of Acute Orbital Cellulitis following Dental Abscess Impacting the Antrum of Highmore.
LEE, Charles, L.R.C.P. Cases of Pemphigus and Essential Shrinkage of the Conjunctiva.
MACGILLIVRAY, A. M.D. (Dundee). Hereditary Congenital Nystagmus.
MURRAY, Geo., F.R.C.S.E. (Edinburgh). A Note on the Surgical Treatment of Deformed Lens.
ROBERTSON, J. S. RUSSELL, M.D. (London). The Influence of the Cerebrum and Cerebellum on Eye Movements.
SMITH, Kenneth, M.B. (Glasg.). Radical Operative Treatment of Trichiasis.

The following gentlemen have also promised to take part in the proceedings: E. F. Drake-Brockman, M.D. (London); Professor Galezowski (Paris); Professor Gayet (Lyons); Professor Meyer (Paris); A. MacGillivray, M.B. (Dundee); Simeon Smith, F.R.C.S. (Edin.); A. M. Ramsay (Glasgow).
The following gentlemen will show specimens in the Museum: E. Treacher Collins, F.R.C.S.; John Griffith, F.R.C.S.; G. Hartridge, F.R.C.S.; H. Juler, F.R.C.S.; D. Marshall, F.R.C.S.; B. W. Doyno, F.R.C.S.; W. J. Cant, M.R.C.S. (Lincoln).

W. Adams Frost, F.R.C.S. (London) will give a lantern demonstration of ophthalmoscopic pictures at noon on August 1st.

J.—DISEASES OF CHILDREN.

Room 3, Ground Floor, King's College.

President: JOHN H. MORGAN, F.R.C.S. Vice-Presidents: W. E. CHADLER, M.D., F.R.C.P.; F. A. SOUTHAM, F.R.C.S.; H. HARRISON, M.D.; W. ARDREY LANE, M.S., F.R.C.S.; A. FOXWELL, M.D., F.R.C.P.; D'ARCY POWER, F.R.C.S. Secretaries: DAWSON WILLIAMS, M.D., F.R.C.P., 25, Old Burlington Street, London, W.; HENRY R. JONES, M.D., 35A, Grove Street, Liverpool; HERBERT P. WATERHOUSE, F.R.C.S., 61, Wimpole Street, London, W.

The following are the arrangements for this Section. The dates and order of the discussions will be adhered to as closely as circumstances permit.

Wednesday, July 27th.

A discussion on Congenital Syphilitic Manifestations in Bones and Joints, to be opened by the President of the Section John H. Morgan, F.R.C.S. Howard Marsh, F.R.C.S., H. H. Chadler, F.R.C.S., Anthony Power, F.R.C.S., Robert Jones, F.R.C.S. (Liverpool), H. E. Robinson, M.D., Frederic Eve, F.R.C.S., and Leopold Hudson, F.R.C.S., intend to take part in the discussion, and C. A. Ballance, F.R.C.S., and H. Mansfield Collier, F.R.C.S., will contribute a series of cases.

A discussion on the Treatment of Hernia in Children, to be

introduced by Rushton Parker, F.R.C.S. (Liverpool). Sir William Stokes, M.D., Ward Cousins, M.D., F.R.C.S. (President of Council), Professor William Macewen, F.R.S. (Glasgow), Professor Chiene (Edinburgh), Mitchell Banks, F.R.C.S. (Liverpool), J. Langton, F.R.C.S. (London), W. Alexander, F.R.C.S. (Liverpool), F. A. Southam, F.R.C.S. (Manchester), Jordan Lloyd, F.R.C.S. (Birmingham), J. Macready, F.R.C.S. (London), D'Arcy Power, F.R.C.S., W. Arbuthnot Lane, M.S., F.R.C.S., G. B. Lockwood, F.R.C.S., H. P. Symonds, F.R.C.S. (Oxford), Herbert Waterhouse, F.R.C.S., George Heaton, M.D. (Birmingham), Damer Harrison, F.R.C.S. (Liverpool), W. G. Black, F.R.C.S. (Newcastle), and Reginald H. Lucy, F.R.C.S. (Plymouth), intend to take part in this discussion.

The following papers will be read:

LOCKWOOD, G. B., F.R.C.S. Hernia of the Ovary in an Infant with Torsion of the Follicle.
THOMSON, John, M.D. (Edinburgh). Congenital Hypertrophy of the Pylorus and Stomach Wall.
GIBBONS, R. A., M.D. On Renal Colic in Infants.
LLOYD, Jordan, F.R.C.S. On Nephrectomy in Children.

Thursday, August 1st.

A discussion on the Nervous Sequelae of Acute Infectious Diseases in Children will be introduced by H. Handford, M.D. (Nottingham), and continued by W. R. Gowers, M.D., F.R.S., Thomas Barlow, M.D., W. B. Cheadle, M.D., Jules Comby, M.D., (Paris), Professor v. Ranke (Munich), R. Robertson, M.D. (Liverpool), James Taylor, M.D., William Hunter, M.D., H. B. Donkin, M.D., T. More Madden, M.D. (Dublin), Fletcher Beach, M.B., E. Mackey, M.D. (Brighton), F. W. Mott, M.D., Montagu Murray, M.D., W. S. Colman, M.D., and Dawson Williams, M.D.

The following papers will be read:

GARROD, Archibald E., M.D., F.R.C.P., and FLETCHER, Morley, M.D. On the Maternal Factors in the Causation of Eickets.
BARTON, J. Kingston, M.R.C.P. (London). The Relation between the Factors of Early Life and the Condition of the Teeth in Youth and Early Adolescence.
BALLANTYNE, J. W., M.D. (Edinburgh). The Relation of Certain Diseases of Infancy to Antenatal Anatomy and Physiology.
COMBY, Dr. J. (Paris). The Non-pathogenic Streptococci and Staphylococci of the Throat in Children.
TELFORD-SMITH, Telford, M.D. (Royal Albert Asylum, Lancaster). The After-History of Two Cases of Craniotomy.
CAITLEY, Edmund, M.D. On the Value of Trophing in Tuberculous Meningitis.

Friday, August 2nd.

A discussion on Doses of Various Remedies suitable for Children at the Several Ages, to be introduced by J. Kingston Barton, M.R.C.P. D. J. Leech, M.D. (Manchester), J. Mitchell Bruce, M.D., H. B. Donkin, M.D., A. Foxwell, M.D. (Birmingham), N. J. Tirard, M.D., Neville Wood, M.R.C.P. (London), and T. More Madden, M.D. (Dublin) intend to take part in this discussion.

The following communications will be made:

GRANT, Nicholas, F.R.C.S.I. (Cork). Demonstration of Osteoclasts.
CARR, J. Walter, M.D. A Protest against the use of the term "Consumptive Bowels."
CATHART, C. W., F.R.C.S. (Edinburgh). On a simple form of Milk Steriliser.

It is proposed also to arrange for the demonstration of cases of interest on each day; among these will be:

CLARKE, J. Jackson, M.B. (London). Congenital Syphilis with Ulceration of Tongue.
EVE, Frederic, F.R.C.S. (London). (1) Spina Indica cured by Excision of sac. (2) Congenital Dislocation of scapula backwards treated by Operation.
MORGAN, J. H., F.R.C.S. (President). A Series of Cases of Excision and Erosion of the Knee-joint.

K. OROLOGY.

Room 22—King's College.

President: Sir W. DALRY, F.R.C.S. Vice-Presidents: CHARLES WARREN, M.D.; G. P. FIELD, M.R.C.S.; E. CHADLER, M.D.; J. DUNDAS GRANT, M.D.; EDWARD LAW, M.D.; C. A. BALLANCE, F.R.C.S. Honorary Secretaries: O. L. E. H. HARRISON, F.R.C.S., 14, Harley Street, W.; G. O. WILKIN, L.R.C.P., 92, Weymouth Street, W.

Wednesday, July 31st.—A discussion on the Treatment of the Various Forms of Nerve Deafness. Opened by J. Dundas Grant, M.D., F.R.C.S.

Thursday, August 1st.—Discussion on Cerebral Complications in relation to Middle Ear Disease. Opened by Professor Macewen, M.D., O.M., F.R.S., LL.D., Regius Professor of Surgery, University of Glasgow.

The following gentlemen have signified their intention of

taking part in these discussions: W. Milligan, M.D.; George Heaton, F.R.C.S.; Dr. Luc (Paris); A. M. Shield, F.R.C.S.; G. W. Hill, M.D.; Lewis Jones, M.D.; H. Macnaughton Jones, M.D.; W. Downie, M.D.; Thomas Barr, M.D.; L. H. Pegler, M.D.; P. McBride, M.D.; J. Walton Browne, M.D.; Farquhar Matheson, M.D.; J. S. Risien Russell, M.D.; E. F. Trevelyan, M.D.; Robert H. Woods, F.R.C.S.I.

Papers will be contributed and Specimens exhibited by the following amongst others:

HARRIS, E. Crosswell, M.B. will show (1) A Dummy for Teaching Palpation of the Naso-Pharynx. (2) A case of Objective Pulsating Tinnitus.

HARRIS, Thomas, M.D. The Treatment of Intra-tympanic Suppurations of the Middle Ear by Operation through the Mastoid.

HENDERSON, Adolph, M.D. Notes of Five Cases of Disease of Attic treated by Modified Stacke's Operation.

COMBES, J. Ward, M.D., F.R.C.S. On the Use of Artificial Tympanic Membranes.

GUYE, Professor. On a not yet described Form of Rotatory Sensation in Patients suffering from Labyrinthine Disease.

HILL, G. Williams, M.D., will show Specimens.

JONES, CAROL, F.R.C.S. Edin. On Turbectomy in Cases of Deafness and Throat Affections.

JONES, H. Macnaughton, M.D. (1) On some Otological Considerations in the Treatment of Serous Deafness. (2) Brief Notes of a Case of Hyper-tension of the Auditory Nerve.

LAMB, Richard, F.R.C.S. On the Anatomical Connections of the Tympanic Membrane, with a few Remarks on their Pathological Importance. Specimens will be exhibited to illustrate this paper.

LAW, Edward, M.D., will exhibit some Preparations sent by Professor Pollitzer.

LAWRENCE, E. A., F.R.C.S., will also show some Normal Bone Preparations made by Professor Pollitzer.

MCNEILLY, George, M.B., will show a Portable Electric Light Battery and Laryngoscope.

MILLIGAN, William, M.D. Tuberculous Disease of the Mucous Membrane of the Middle Ear and its Adnexa: an experimental investigation. Diagrams and Specimens will be exhibited to illustrate this paper.

PEGLER, L. H., M.D., will show Microscopic Sections illustrating the Histology of Tubercular and Serous Hyperplasias.

PRITCHARD, John, M.D. Microscopical specimens of Aspergillus.

SCATLIV, J. M. E., M.D. On the Use of the Pneumatic Speculum in the Treatment of Diseases of the Ear.

WOODS, Robert H., F.R.C.S.I., will show specimens.

L. PHARMACOLOGY AND THERAPEUTICS.

East Wing Room, Ground Floor—Conjoint Examination Hall.

President: Sir WILLIAM ROBERTS, M.D., F.R.S. Vice-Presidents: J. TALFOURD JONES, M.B.; T. LAUDER BRUNTON, M.D., F.R.S.; J. MITCHELL BRUCE, M.B.; W. HALE WHITE, M.D.; DONALD MACALISTER, M.D.; M. McHUGH, M.B. Honorary Secretaries: VAUGHAN HARLEY, M.D., 25, Harley Street, W.; W. SOLTAN FENWICK, M.D., 10, Devonshire Street, W.

Wednesday, July 31st.

10 A.M. The President's introductory remarks. 10.15 A.M. Discussion upon Serum-therapeutics: Dr. Klein. 10.35 A.M. Dr. Washbourn. 10.55 A.M. Professor Fraser. 11 A.M. Dr. Charteris. 11.15 A.M. Dr. Hewlett. 11.25 A.M. Dr. Tizard. 11.35 A.M. Dr. Sidney Phillips. 11.45 A.M. Dr. Gayton. 11.55 A.M. Dr. Caiger. 12.5 P.M. Mr. Bokenham. 12.15 P.M. Dr. Goodall. 12.25 P.M. Dr. Bruce. 12.35 P.M. Dr. MacCombie. 12.45 P.M. The opener's reply.

Papers by:

FRASER, Professor. The Antitoxin of Snake Poison.

BOKENHAM, T. J., M.B. The Antitoxin of Erysipelas.

AROSTOFF, Professor. The Therapeutic Value of Alternating Currents of High Frequency.

MOSS, Professor. (1) The Therapeutic Action of Formaline. (2) The Interchange of Gases in the Lung at High Altitudes.

OLIVER, George, M.D. The Therapeutic Uses of Suprarenal Capsules.

OTTOLENGHI, Professor. The Therapeutic Value of Calomel followed by Salt and Acid Substances.

ROSENDAHL, Professor. (Title not yet communicated.)

Thursday, August 1st.

10 A.M. Discussion on the Requirements of the Profession with reference to the Revision of the *British Pharmacopoeia*: Dr. Leech. 10.20 A.M. Professor Donald MacAlister. 10.30 A.M. Professor Bradbury. 10.40 A.M. Dr. Page. 10.50 A.M. Dr. Talfourd Jones. 11 A.M. Dr. Charteris. 11.10 A.M. Dr. W. Carter. 11.20 A.M. Dr. C. Pearson. 11.30 A.M. Dr. Tizard. 11.40 A.M. Dr. Neville Wood. 11.50 A.M. Dr. Thomas Oliver. 12. Dr. H. G. Iya. 12.10 P.M. Dr. A. Kinsey-Morgan. 12.20 P.M. Dr. W. Armstrong. 12.30 P.M. Dr. Ralph Stockman. 12.40 P.M. The opener's reply.

Papers by:

TALFOURD, George, M.D. Therapeutics of the Digitalis Group.

PHILLIPS, C. D. F., M.D. The Pharmacological Action of Berberine.

SHARP, Gordon, M.B. Notes on the Action of the Mydriatic Group.

DUTTON, Thomas, M.D. The Dietetic Treatment of Disease.

CAUTLEY, K., M.D. Therapeutic Action of Foods in Diseases of Children.

CHURCHILL, F. M.D. The Therapeutic Value of Massage.

SURVEYOR, N. F., M.D., and HARLEY, Vaughan, M.D. The Action of a Naphthol and Bismuth Subnitrate as Intestinal Antiseptics.

FENWICK, W. Soltan, M.D. Intestinal Antiseptics.

Friday, August 2nd.

Papers by:

10 A.M. GUYE, Robert, M.R.C.S. Therapeutic Value of the Waters of Woodhall Spa.

10.15 A.M. HADDLEY-WILMOT, R., M.B. Therapeutic Value of the Waters of Leamington Spa.

10.30 A.M. FOX, Fortescue, M.D. Therapeutic Uses of the Waters of Strathpeffer Spa.

10.45 A.M. HYDE, Samuel, M.D. Therapeutic Value of the Waters of Buxton.

11 A.M. MYRTLE, A. S., M.D. Therapeutic Value of the Waters of Harrogate.

11.15 A.M. SPENDER, J. Keat, M.B. Therapeutic Value of the Waters of Bath.

11.30 A.M. TOMLINS, W., M.R.C.S. The Brine Baths of Droitwich.

11.45 A.M. CORNACK, G. E., M.D. Vichy and its Waters.

ARMSTRONG, W., M.R.C.S. The Therapeutics of Rheumatoid Arthritis.

HARRIS, Vincent, M.D. Creasote in Pulmonary Disease.

WALTERS, F. R., M.D. The Subcutaneous Use of Gualacol.

TIRARD, Nestor, M.D. The Treatment of Uramic Dyspepsia.

SNOW, Herbert, M.D. Lorcain.

ILLINGWORTH, G. R., M.D. Tabellae and Tabloids, their Uses and Abuses.

OVEREND, Walker, M.B. Arsenic and Belladonna in Chorea.

GOODBODY, F. W., M.D., and HARLEY, Vaughan, M.D. Action of Piperazine on Uric Acid in the Urine.

M. LARYNGOLOGY.

North Room, Ground Floor—Conjoint Examination Hall.

President: FELIX SEMON, M.D. Vice-Presidents: Sir PHILIP SMYLY, M.D.; W. MACNEILL WHISTLER, M.D.; F. DE HAVILLAND HALL, M.D.; GREVILLE MACDONALD, M.D.; SCANES SPICER, M.D.; A. W. SANDFORD, M.D. Honorary Secretaries: J. MIDDLEMASS HUNT, M.B., 55, Rodney Street, Liverpool; ST. CLAIR THOMSON, M.D., 28, Queen Anne Street, W.; E. B. WAGGETT, M.B., 68, Park Street, W.

Wednesday, July 31st.—Introductory Remarks by the President, to be followed by a Discussion on the Etiology of Mucous Polyp of the Nose, introduced by Professor Guye (Amsterdam), Dr. Luc (Paris), and Dr. McBride (Edinburgh).

The following members have expressed their intention of joining in the discussion: T. Mark Hovell, F.R.C.S. Ed., R. Lake, F.R.C.S., L. H. Pegler, M.D., A. Hodgkinson, M.D. (Manchester), W. Milligan, M.D. (Manchester), Charles Warden, M.D. (Birmingham), and R. McKenzie Johnston, M.D. (Edinburgh), Scanes Spicer, M.D., and William Hill, M.D.

Original papers:

RUSSELL, J. B. Risien, M.D. The Representation of Abduction of the Vocal Cords in the Cerebral Cortex.

HODGKINSON, Alexander, M.D. (Manchester). (1) On the Vibrations of the Vocal Cord; (2) On the Function of the Laryngeal Ventricles.

ILLINGWORTH, G. R., M.D. (Ventnor). Some points in the Anatomy and Physiology of the Larynx.

Thursday, August 1st.—The Infectious Nature of Lacunar Tonsillitis, introduced by Professor B. Fraenkel (Berlin), and Dr. J. Macintyre (Glasgow).

The following have expressed their intention of speaking on the subject: T. Mark Hovell, F.R.C.S. Ed., A. Hodgkinson, M.D., Charles Warden, M.D., Watson Williams, M.D. (Bristol), Adolf Bronner, M.D. (Bradford), Scanes Spicer, M.D., and W. Hill, M.D.

Original papers:

BRONNER, A., M.D. (Bradford). Some cases of Diseases of the Larynx and Bronchi treated by Intralaryngeal Injections.

MORITZ, E., M.D. (Manchester). The Laryngeal Symptoms and Sequelae of Influenza.

STOKER, George S., M.R.C.P.I. An improved method of removing Nasopharyngeal Tumours.

Friday, August 2nd.—The Indications for Early Radical Operation in Malignant Disease of the Larynx, introduced by Dr. Bryson Delavan (New York), and Mr. H. T. Butlin (London).

The following members have expressed their intention of joining in the discussion: Philip de Santi, F.R.C.S., A. Hodgkinson, M.D., Charles Warden, M.D., Robert H. Woods, M.B. (Dublin), and Charters Symonds, M.S., F.R.C.S.

Original papers:

MILLIGAN, William, M.D. (Manchester). Vocal Defects among School Board Teachers, with special reference to the occurrence of teachers' nodes.

HODGKINSON, A., M.D. (Manchester). On Chorditis Tumorosa.

DE SANTI, Philip, F.R.C.S. The Operation of Thyroidectomy, with a short account of the cases in which it has been performed at St. Bartholomew's Hospital during the last fifteen years.

Demonstrations of Instruments:

METCALFE, G., M.B. (Newcastle-on-Tyne). (1) Demonstration of a new portable and extremely portable Electric Light Battery. (2) A Prismatic Electric Light Battery. (3) A Self-retaining Laryngoscope.
MORRIS, E., M.D. (Manchester). A Self-retaining Laryngoscope.
ROBINSON, A., M.D. (Manchester). A new form of Magnifying Laryngoscope.

The following gentlemen purpose being present and taking part in the work of the Section: Professor Fraenkel, Professor Guyle, Dr. Luc, Dr. Bryson Delavan, Professor Moritz Schmidt (Frankfurt), Dr. F. H. Bosworth (New York), Dr. John Mackenzie (Baltimore), Professor v. Sokolowski (Warsaw), Dr. A. Brady (Sydney, N.S.W.), Dr. Walker Downie (Glasgow), Dr. Hillis (Dublin), Dr. W. Robertson (Newcastle-on-Tyne), Dr. Cecil Shaw (Belfast), Dr. W. Bolton Tomson (Luton), Mr. R. Stow Armstrong, Dr. Dmochowski (Warsaw), Dr. Logan Turner (Edinburgh), Dr. Samuel Johnston (Baltimore), Dr. H. S. Birkett (Toronto), and Dr. Irving Kimball (Chicago).

N. DERMATOLOGY.

West Wing Room, Second Floor—Consult Examination Hall.

President: H. RADCLIFFE CROCKER, M.D. Vice-Presidents: MCALL, ANDERSON, M.D.; MALCOLM MORRIS, F.R.C.S. Edin.; J. J. PRINGLE, M.E.; WM. ANDERSON, F.R.C.S.; H. A. G. BROOKE, M.B. Honorary Secretaries: J. HERBERT SNOWDEN, M.D., 41, Finsbury Square, E.C.; JONATHAN HUTCHINSON, Jun., F.R.C.S., 15, Cavendish Square, W.

Wednesday, July 31st, 10 A.M., President's Address.

The following subjects have been selected for discussion in the Section:

The Pathology and Treatment of Pruritus, introduced by McAll Anderson, M.D., of Glasgow, and H. A. G. Brooke, M.B., of Manchester.

Part in the Etiology and Treatment of the Diseases of the Skin, introduced by W. Allan Jamieson, M.D., of Edinburgh, and Walter G. Smith, M.D., of Dublin.

The following papers have been announced:

ANDERSON, William, F.R.C.S. The Treatment of Adenoma Sebaceum.
JENNETT, Frank H., M.D. F.R.C.S. A Case of Cheiro-Pompholyx.
COMPTON, Edward, F.R.C.S. The Treatment of Syphilis by Injections of Syphilo-Antitoxin.
JAMES, Arthur T., M.D. A Case of Lupus; Result of Treatment by Therapeutic Feeding (with Photographs).
EDWARDS, Alfred, M.D. Brief Notes on Corns—true and so-called (Drawings and Microscopic Specimens).
FOX, T. Abbott, M.B. Two Short Papers.
GARDNER, James, M.D. Certain Nervous Lesions of the Skin.
HARRISON, A. J., M.B. On Two Cases of Unusual Verruca Necrogenica (with Photographs).
HUTCHINSON, Jonathan, Jun., F.R.C.S. Microscopic Sections, and Drawings of Case of Rodent Ulcer of Forearm.
JENNETT, John, M.D. (Harrogate). Case of Pityriasis Rubra Pilaris. Clinical Features, and Minute Anatomy (with Microscopic Sections).
MANNING, Edward, M.D. (Brighton). Cheiro-pompholyx in association with Eczema.
MANNING, F., M.D. Short Communication on the Guinea Worm (with Microscopic Specimens).
FRANKLIN, George, L.R.C.P., M.R.C.S. Pemphigus.
PETERSON, P. H., M.D., F.R.S. Affections of the Skin occurring in the Course of Bright's Disease.
ROBERTSON, James, M.D. Treatment and Prognosis of Trichophytosis based on the Pathology of the Trichophyton.
SMITH, Walter G., F.R.C.S. Edin. (Birmingham). Note on a Case of Lichen Planus Verrucosus.
SNOWDEN, James, M.R.C.S. One or Two Living Specimens of Uncommon Conditions, and Short Notes.
STEWART, George, M.R.C.P.L. The Treatment of Alopecia Areata by Oxygen Gas.
STEWART, J. Herbert, M.D. On a Case of Dermatitis Repens (with Coloured Drawings).
WALKER, Henry, M.D. (Glasgow). Paper on Alopecia Areata.
WALKER, Samuel, M.D. (Edinburgh). The Methods of Examination of the Skin Histologically.

Friday, August 2nd, will be devoted to the demonstration of cases. Notice should be sent by members intending to exhibit, with description of cases to J. H. Stowers, M.D., not later than July 27th.

O. ETHICS.

Room B—King's College.

President: W. F. OLVERLAND, M.D. Vice-Presidents: THOMAS BRIDGWATER, M.B.; J. HUGHES FRIMMING, M.R.C.S.; D. B. BALDING, F.R.C.S.; C. PARSONS, M.D.; W. H. AXFORD, M.B.; A. DENNERY, M.D. Honorary Secretaries: MAJOR GREENWOOD, M.D., LL.B., 213 Hackney Road, N.E.; T. F. PHARR, M.D., 12, Norfolk Street, Southsea; Hugh Woods, M.D., 11, Arclway Road, Highbury, N.

Wednesday, July 31st.—General Address by the President.

Subjects concerning more particularly the relations of medical men with each other:

1. Intraprofessional Etiquette, introduced by Thomas Garrett Horder, L.R.O.P.

2. Advertising, introduced by George Wm. Potter, M.D.

3. Unqualified Assistants, introduced by George Brown, M.R.C.S., and continued by J. Brindley James, L.R.O.P.

Thursday, August 1st.—The Ethics of Gratuitous and Cheap Contract Practices.

1. Clubs, Medical Aid Societies, and Contract Practices; introduced by R. W. Dayne, F.R.C.S. The discussion will be continued by Hughes Hemsling, M.R.C.S., W. Gosse, L.R.O.P., W. A. Edleston, M.D., A. H. Bampton, M.D., W. Newman, M.D., Philip Lee, L.R.C.P.I., and others.

2. Hospitals and Dispensaries, introduced by Hugh Woods, M.D., Frank Groves, M.R.C.S., R. R. Rentoul, M.D., and Nelson Hardy, F.R.C.S., will take part in the discussion.

The Secretaries will be glad to hear from members willing to join in the above discussions.

Friday, August 2nd.—1. Any subject, the discussion of which has not been completed on the two previous days.

2. The reading of any selected papers which do not come under the above heads.

The following papers have been announced:

BERRY, Wm., F.R.C.S. On Contract, Club, and Dispensary Practice.
BLACK, D. Campbell, M.D. On Hospitals Advertising and Medical Etiquette.

DICKINSON, W. G., L.R.C.P. President Principle in Patient Attendance.
GLEDHILL, J. Grierison, M.B., Barrister-at-Law, Medical Party.
MULLINS, George Lane, M.D. On the Profession in New South Wales.
PARRIS, T. E., M.D. The Swearing of the Profession by Various Friendly Societies.

RICE, William Richardson, M.D. The Public Medical Service and its Relation to Medical Ethics.

SIBLEY, Knowsley, M.D. State Aided v. Voluntary Hospitals.

WILLIAMS, A. D., M.D. Changing Relations of the Profession and the Public.

Honorary Local Secretaries:

ANDREW CLARK, F.R.C.S., 71, Harley Street, W.

LEAMHARD OWEN, M.D., 40, Curzon Street, W.

Honorary Local Treasurer:

GEORGE EASTES, M.B., F.R.C.S., 35, Gloucester Terrace, Hyde Park, W.

PROGRAMME OF PROCEEDINGS.

TUESDAY, JULY 30TH, 1895.

9.30 A.M.—Meeting of 1894-95 Council. Council Room, Exeter Hall.
11.30 A.M.—Special Service at St. Paul's Cathedral. Sermon by His Grace the Archbishop of Canterbury.

2.30 P.M.—First General Meeting. Report of Council. Reports of Committees; and other business. Exeter Hall.

3.30 P.M.—Reception by the Metropolitan Committee. In the Imperial Institute.

9 P.M.—General Meeting. President's Address.

9.45 P.M.—Conversations.

WEDNESDAY, JULY 31ST, 1895.

9.30 A.M.—Meeting of 1895-96 Council. Council Room, Exeter Hall.
10 A.M. to 5 P.M.—Meetings of Sections. King's College, Consultation Examination Hall, and Exeter Small Hall.

3 P.M.—Second General Meeting. Exeter Hall. Address in Surgery by JONATHAN HUTCHINSON, F.R.C.S., F.R.S., Consulting Surgeon to the London Hospital. Presentation of the Mount Prize to the Surgeon-Lieutenant Colonel W. Douglas Cunningham, M.D., F.R.S.

3.30 P.M.—Musical Preliminary at Gardens of Royal Botanic Society.
5 P.M. to 12 P.M.—Illuminated Evening Fete at Gardens of Royal Botanic Society.

THURSDAY, AUGUST 1ST, 1895.

9.30 A.M.—Meeting of Council. Council Room, Exeter Hall.
10 A.M. to 5 P.M.—Meetings of Sections. King's College, Consultation Examination Hall, and Exeter Small Hall.

3 P.M.—Third General Meeting. Exeter Hall. Address in Surgery by JONATHAN HUTCHINSON, F.R.C.S., F.R.S., Consulting Surgeon to the London Hospital. Presentation of the Mount Prize to the Surgeon-Lieutenant Colonel W. Douglas Cunningham, M.D., F.R.S.

1.30 P.M.—Dinner of the Association at Queen's Hall, Langham Place.

FRIDAY, AUGUST 2ND, 1895.

10 A.M. to 5 P.M.—Meetings of Sections. King's College, Consultation Examination Hall, and Exeter Small Hall.
3 P.M.—Fourth General Meeting. Exeter Hall. Address in Surgery by EDWARD ALBERT SIBBLEY, F.R.S., F.R.C.S., Professor of Pathology, University College.

9 P.M.—Conversations at the Royal College of Physicians.
9 P.M.—Conversations at the Royal College of Surgeons.

SATURDAY, AUGUST 3RD, 1895.

CONFERENCES.

Particulars of further entertainments, open to a limited number of Members only, will be found in the Local Notice.

RECEPTION ROOM

The large hall at King's College will be opened at 12 o'clock noon on Monday, July 29th, and on Tuesday, July 30th, and the following days at 9 o'clock, for the issue of tickets to members and for supplying all necessary information. A reception room for invited foreign guests will be provided next to the large hall. It is particularly requested that members on their arrival will at once proceed to the reception room, King's College, enter their names and addresses, and obtain their tickets and Daily Journals containing programme, inquire for letters and telegrams, consult the list of lodgings, hotels, etc.

NOTICE TO LONDON AS WELL AS COUNTRY MEMBERS.

Members of the Association who intend visiting London during the annual meeting to be held on July 30th, 31st, August 1st and 2nd, and who have not already sent in their names, are particularly requested to do so at once that they may be included in the list of those intending to be present.

Those desirous of obtaining dinner tickets are requested to send in their applications without delay. Tickets and plans of the tables will be issued, on presentation of receipts, in the Reception Room, King's College, where seats can be selected, on and after Tuesday, 30th instant, from 9 A.M.

HOTEL ACCOMMODATION AND LODGINGS.

A list of hotels offering special tariffs or discounts on their tariffs, together with a list of apartments which are recommended by members of the Association, may be had on application to the Honorary Secretary of the Reception Committee, 11, Chandos Street.

Only members of the British Medical Association, invited guests and accredited strangers will be allowed to attend the general meetings or the meetings of sections. Members and guests will be required to show their cards, which must be obtained and signed for at the Reception Room. Invited guests will be required to show their invitation cards upon entrance to any of the general meetings or meetings of sections. Members and guests are therefore earnestly enjoined to take care of their cards of admission, and to note that they are not transferable, and if lost cannot be renewed. Members or guests may take one lady only to any of the entertainments.

Only members and officially invited guests will be admitted to the dinner of the Association.

The Reception Rooms will be opened on Monday, July 29th, at 12 o'clock noon. Tickets for the dinner and excursions will not be issued until Tuesday morning. In applying for tickets members will be required to produce their membership cards to be stamped.

The members' Reception Room is in the large hall of King's College. There is a separate Reception Room for invited foreign guests next to the members' Reception Room, and another for ladies at the Royal Society's Rooms, Burlington House.

The post office and telegraph office are in the Reception Room, King's College. Members are requested to apply for letters and telegrams from time to time.

A list of members who have already expressed their intention of being present at the annual meeting of the Association has been printed, and may be seen on application at the office of the annual meeting, 11, Chandos Street, Cavendish Square, or at the offices of the Association.

Messrs. THOMAS COOK AND SONS, the well-known tourist agents, state that they will be in a position to make special railway arrangements for members attending the annual meeting when a considerable number are coming from the same town. Messrs. Cook and Sons will have a stall in the Reception Room at King's College for the sale of railway and tourist tickets.

Cans for the breakfast of the British Medical Temperance Association will be placed for distribution in the Reception

Room, and may be applied for by members. In the unavoidable absence of the President, Sir B. W. Richardson, Dr. Long Fox will preside.

NOTICES OF MOTION.

Dr. ARTHUR WELSFORD hereby gives notice that he will move and Mr. J. F. BULLAR will second:

That it is to the interest of the public and of the medical profession that the Council of the British Medical Association should take power and authority to protect both the individual and collective interests of the medical profession, and that the Council be requested to take such steps as may be necessary to enable it to actively undertake these duties.

Mr. LAWSON TAIT hereby gives notice that he will move, and Mr. COLIN CAMPBELL will second:

That we, the members of the British Medical Association, while anxious to improve the training and supervision, and, if need be, to support, a practical scheme for the registration of medical, surgical, and midwifery nurses, emphatically condemn any proposal which has for its object the formation of a class of medical or surgical or midwifery practitioners other than those recognised under the Medical Act, 1858, as now existing. We protest against the Midwives Registration Bill because it proposes to establish a class of midwifery practitioners who would be very incompletely trained in midwifery, and entirely untrained in medicine, surgery, and pharmacy—a matter of supreme importance in midwifery practice. We therefore instruct the Council and the Parliamentary Bills Committee to use every means to oppose any Bill which proposes to give to persons registered under it power to conduct, on their sole and independent responsibility, any midwifery practice without the guarantee of a complete curriculum and qualification. That this Association recommends a sum not exceeding £1,000 be expended for the purpose of opposing any such Bill.

Dr. INCE hereby gives notice that he will move and Mr. HORATIO NELSON HARDY will second, as an amendment to the above:

That in the interests of the mothers of the United Kingdom the registration of midwives, after suitable training and examination, is a subject deserving the early and careful consideration of the Legislature, and in that consideration it is equally desirable that the legitimate rights and privileges of duly qualified medical practitioners should not be overlooked.

Dr. BEDFORD FENWICK hereby gives notice that he will move:

That in the opinion of this meeting it is expedient that an Act of Parliament should, as soon as possible, be passed providing for the registration and education of medical, surgical, and obstetric nurses; and the Council of this Association are therefore requested to consider this matter, and to take such measures as may seem to them advisable to obtain such legislation.

PROPOSED INCREASE IN THE NUMBER OF DIRECT REPRESENTATIVES ON THE GENERAL MEDICAL COUNCIL.—Dr. H. R. RENTOUL hereby gives notice that he will move, and Dr. H. Woods will second:

That as Sections 7 and 8 of the Medical Act, 1858, provide for the election of only five direct representatives to the General Medical Council by the registered medical practitioners resident in the United Kingdom; and as Section 10, Subsection 1, Paragraph c of this Act provides that the General Medical Council may represent to the Privy Council that it is expedient to confer upon the registered medical practitioners resident in any part of the United Kingdom the power of returning an additional number of direct representatives to the General Medical Council; and as the General Medical Council has, on November, 1880, on November, 1881, and on November, 1882, refused absolutely to make such representation; and as the number of registered medical practitioners has increased from 22,713 in 1879 to 32,634 in 1894; and as we medical practitioners were not given our due and proper number of direct representatives in 1880; and as the registered practitioners contribute all the income of the General Medical Council, by which the Medical Acts are administered, while the twenty universities and colleges represented on the General Medical Council do not contribute any income to it; and as the representatives of the universities and colleges are elected to the General Medical Council by their small Convocations, Senates, and Councils, and not by open vote of all their medical graduates only; and as other important councils, having similar but larger duties to the General Medical Council (such as the Councils of the Incorporated Law Societies of England and of Ireland, the Councils of the Pharmaceutical Societies of Great Britain and of Ireland, and the Council of Veterinary Surgeons) consist of direct representatives only, this Association instructs its Council to take immediate steps to have a Bill introduced into Parliament providing that the registered medical practitioners in England and Wales be empowered to elect five additional direct representatives, the practitioners resident in Scotland one additional direct representative, and the practitioners resident in Ireland one additional direct representative to the General Medical Council.

Dr. BEDFORD FENWICK hereby gives notice that he will move:

That, in the opinion of this meeting, the time has arrived when it is expedient that the registered medical practitioners resident in England, and also the registered medical practitioners resident in Wales, should separately be granted the privilege of returning one additional member to the General Medical Council; and the Council of this Association are therefore requested to petition the General Medical Council to represent to Her Majesty's Privy Council the expediency of such an addition to their members, in accordance with Section 10 of the Medical Act of 1858.

THE UNRESTRICTED SALE OF POISONS AND OTHER DANGEROUS DRUGS BY CHEMISTS BY MEANS OF PRESCRIPTIONS OF MEDICAL PRACTITIONERS.—It will be moved by Dr. R. R. RENTOUL and seconded by Dr. D. CAMPBELL BLACK:

That owing to the unrestricted dispensing by chemists of prescriptions of medical practitioners on more than one occasion which contain poisons and other dangerous drugs, having regard to the evils arising therefrom, and to the law in other countries, this Association recommends the members to write across the face of such prescriptions the words, "Not to be repeated," or "To be repeated once," and "To be renewed by the chemist to the practitioner," duly stamped and dated. And that if chemists refuse to adopt this rule, the members residing in cities and towns are recommended to establish their own and manage under their exclusive control depots at which all their prescriptions shall be dispensed.

PROPOSED FUND FOR THE BENEFIT OF THE WIDOWS AND ORPHANS OF MEDICAL PRACTITIONERS.—It will be moved by Dr. R. R. RENTOUL:

That this meeting instruct the Council to obtain a table from an actuary showing the amount of annual and other payments necessary to provide the widows and orphans of subscribers (as their right and not as a charity) with an annuity of £10, or any multiple of £10 not exceeding £50. That such fund consist of two departments: First, an annuity department, the payments to which shall consist of entrance-tax, marriage-tax, age-tax, husband and wife equalising age-tax, annual tax, and foreign residents tax. The annuity to go to the widow so long as she remain a widow, and on the death of the widow, or on the death of the subscriber not leaving a widow, to the male and female children the issue of the subscriber, until the youngest male child has attained the age of 18 and unmarried, or the youngest female child the age of 21 and unmarried. Secondly, an immediate benefit department, to be based upon the principle of having no annual fees, but an agreement made by each subscriber who is a member of the annuity department to pay a small sum of money (in no case exceeding 5s.) on the death of each subscriber. The death of the subscriber to be notified to the General Secretary, who shall give notice in the next issue of the BRITISH MEDICAL JOURNAL of the death, and call upon each subscriber to contribute the amount of call. Subscribers of this department, whether married, single, or widowers, to possess the power to bequeath the proceeds of such "call" either to their widows, orphans, parents, or other nominees. That Mr. James Gatham, F.R.A., Edinburgh, who has advised R. R. Rentoul regarding the formation of such a medical practitioners' widows' and orphans fund, be requested to draw up the above-mentioned table.

PROPOSED IMPROVEMENT IN THE TRAINING OF MEDICAL STUDENTS IN PRACTICAL MIDWIFERY.—It will be moved by Dr. LOVELL DRAGE and seconded by Dr. R. R. RENTOUL:

That we view with deep concern and regret the recommendation of the General Medical Council to the medical examining bodies that they should admit students to their final examination who present a certificate stating that they have "qualified personally," only three, and "been present at" only three confinements; and as the General Medical Council has refused on November, 1894 to alter this recommendation, we instruct our Council to petition the General Medical Council to recommend that no student be admitted to his final medical examination until he presents a certificate showing that he has personally conducted at least three confinements under the direct supervision of a registered medical practitioner. We also instruct the Council to take immediate steps to have Section 26 of the Metropolitan Poor Act, 1860 repealed, which prevents workhouse infirmaries from being used for the clinical instruction of medical students in practical midwifery while pupil midwives are now admitted; and also to petition the committees, medical staffs, and, if need be, the subscribers to the City of London Lying-in, the London Lying-in, and the Christian Maternity to withdraw their rule which excludes female medical students from clinical instruction at these hospitals, seeing that these are now used by pupil midwives.

Proposed by R. TEMPLE WRIGHT, M.D., Brigade-Surgeon-Lieutenant-Colonel retired, seconded by F. W. PARSONS, M.R.C.S., L.R.O.P., of Wimbledon:

That this meeting desires to submit a respectful suggestion to the General Medical Council that every medical officer whose name appears in the Navy List, the Army List, and the Indian Army List shall be considered to be still alive and at the post opposite his name.

June, 1895.

FRANCIS FOWKE, General Secretary.

The Ladies' Reception Committee have organised the following excursions, under the guidance of experts, for the benefit mainly of the wives of members of the Association. Should any lady, however, wish to obtain a ticket for an excursion for her husband it will be possible for her to do so. The number of tickets for each excursion will be strictly limited, and it is mentioned below. The cost of a ticket for each excursion, except for the one to the Cambridge Colleges, will be 1s. Ladies living in London will not be able to obtain tickets till the week of the meeting. Ladies living in the country or abroad may obtain them in advance by writing, and enclosing postal orders, to Mrs. R. Priestley, 81, Linden Gardens, Rayawater, London, W.

1. Girton and Newnham Colleges, Cambridge (40 tickets). The party will be entertained at the two Colleges. Date: Friday, August 2nd.

2. Westfield College, Hampstead (30 tickets). Date: Friday, August 2nd. Tea and coffee will be provided by the College.

3. British Museum. Mr. A. S. Murray will take a party of 15 on two days to the Greek antiquities, and Mrs. Tirard will take a party of 15 on one day to the Egyptian antiquities.

4. St. Paul's Cathedral. The Rev. Canon Gilbertson will take a party of 30 on July 31st.

5. Westminster Abbey. The Very Rev. the Dean of Westminster, Mrs. Murray Smith, and Mr. Weller will respectively take a party of 20 on July 31st, August 1st, and August 2nd. The Royal and other wax effigies in the Abbey will be shown.

6. The Tower of London. The Rev. W. J. Loftie will take a party of 25 on July 31st at 2 P.M. Special orders have been obtained from the Governor of the Tower.

7. National Gallery. Mr. Cosmo Monkhouse and Miss M. K. Bradby will take a party of 12 on July 31st and August 1st respectively.

8. Natural History Museum. Mr. George Murray will take a party of 30 on July 31st at 11.30 A.M.

9. South Kensington Museum. The Director, Mr. Armstrong, will take a party of 12 on July 31st and August 1st, at 2.30 P.M.

SPECIAL CORRESPONDENCE.

PARIS.

The Struggle against Alcoholism.—House Refuse and its Treatment.—The last News of the Paris Odeurs Commission.—Bacteriological Diagnosis of Diphtheria.—Dissecting at Charent.—The Treatment of Skins.—Small-pox at Marseilles.—H-nours in the Scientific World.—General News.

THE struggle against alcoholism, if not throughout France, is, in the capital, certainly the question of the day. M. Henri Rochefort, in the *Intransigeant*, vigorously combats the growing vice and scourge. M. Poincaré, the Minister of Public Instruction, has appointed a Commission to formulate the measures to be adopted to introduce instruction on the effects of alcoholism in school education. This Commission has decided on the following programme: 1. That Ministerial circulars be sent to all institutions urging them to perfect their instruction in this sense; also that rewards be accorded to those who distinguish themselves in this struggle against alcoholism. 2. That a manual, prepared by distinguished specialists, be distributed among the institutions to guide them in the alcoholic instruction they give their pupils. 3. In the *écoles normales* and the *écoles primaires supérieures* masters and directors give lectures on the subject or, whilst treating his own special subject draws from it practical conclusions qualified to combat alcoholism. 4. In superior and normal schools two or three lectures are to be given every year. The same instruction will be given in girls' schools. It is believed that these propositions will be put in practice in the opening scholastic term.

M. Petsche, urges that house refuse ought to be removed during the night. The recipients containing it, whilst awaiting removal, ought to be lined with galvanized iron, provided with well-fitting lids, and of convenient dimensions. Broken glass and china, pieces of old iron and rusty metal, ought to be placed apart, and M. Petsche wishes to see the regulations concerning this point revised and strengthened. The carts removing the refuse ought to be covered; the danger incurred by allowing the army of Paris *chiffonniers* and others to rummage one after the other the dust boxes placed on the Parisian pavement awaiting the dust cart has not yet even been notified, therefore not combated. So long as this dispersion of deleterious dust is practised over and over again during the early morning by the seekers of broken bread, rags, cinders, etc., each having their special attraction for the army of their ragged and needy searchers, it is useless to provide iron-lined receptacles with well-fitting lids. Dr. Bourneville, one of the most practical sanitarians in France, has long ago called attention to the faulty system of removing house refuse and hospital *débris*. He energetically pointed out the necessity of improving the carts used by the Souffrice Company, which undertake its removal.

These carts leave in their track a terrible and dangerous stench.

The most recent news of the administrative Commission entitled "Des Odeurs de Paris", is that it has decided to divide into two sub-commissions each numbering five members. One technical will investigate the origin of the "Odeurs," the other will study the legal side of the question, determine the value of the laws as they are, and the means of rendering them more efficacious.

Since January 1st, 1895, facilities have been offered to medical men at the bacteriological laboratory of the city of Paris for the bacteriological diagnosis of diphtheria. On application at the laboratory suitable tubes and swabs are forwarded, and the result of the analysis is communicated to the medical men twenty-four hours after it is received at the laboratory. Stamps forwarded to the amount of 51. entitle the applicant to an answer by telegram. The laboratory, Rue Lobau, is open from 8 A.M. to 8 P.M., Sundays and holidays included.

It has been at last decided that 200 students of the Paris Faculty of Medicine are to dissect at the Clamart dissecting rooms, hitherto reserved for hospital house surgeons, the faculty dissecting rooms being overcrowded. The two Clamart professors will receive increased salaries amounting to 120 francs per year, and two aides are to be appointed.

Professor Riche has reported to the Health Council of the Seine department that skins coming from abroad should be unpacked in the open air on ground moistened with a solution of carbolic acid. Those who handle the skins should wear a special tight-fitting costume; face, hands, neck, and arms should immediately after the unpacking be washed with an antiseptic solution. The debris should be removed at once. Skins should never be removed by being carried on the backs of the people employed, but in barrows. Localities where the skins are prepared should be constructed without side walls in order to allow the free ingress and egress of the air. The skins should be arranged in low piles in order to prevent dust from them from accumulating. Cases of malignant pustule may thus be prevented. Professor Riche calls attention to the fact that in preparing skins in France arsenic is used in a much greater proportion than formerly to preserve them during the transport from abroad. He suggests that sulphide of sodium should be used as a substitute.

According to statistics furnished by Dr. Froust at the Comité Consultatif d'Hygiène de France, during the first six months of 1895, there were 175 deaths at Marseilles resulting from small pox, a rate of 4 per 10,000. At Paris during the same period, according to M. A. J. Martin, there were 10 deaths due to small-pox, a rate of 0.01 per 10,000.

M. Malassez, the well known histologist of the Collège de France, has received the long deferred and well-merited honour of the nomination as a Chevalier of the Legion of Honour.

Sir William Flower and Professor Ramsay have been elected Membres Correspondants of the Paris Academy of Science.

The death is announced of Dr. H. Baillon, Professor of Botany at the Paris Medical Faculty, Fellow of the Royal Society, and officer of the Legion of Honour. Cerebral congestion overtook him whilst in his bath, and he was found drowned in it. He published several works, the principal is *Le Dictionnaire Botanique et l'Histoire des Plantes*.

The death is announced of Dr. Kiener, Professor of Pathological Anatomy at the Montpellier Medical Faculty and director of the health service of the 116th Regiment. Dr. Kiener was *professeur agrégé* at the Val de Grace military hospital; it was he who organised the anti-diphtherial laboratory at Montpellier. He and Professor Kelsch, the Director of the military school, published many joint works.

At Montpellier a municipal decree forbids tradespeople to use coloured paper for folding up any edible articles.

We are glad to see that the Poplar Union has joined in the movement in favour of trained nurses, and are advertising for a trained nurse.

The Grocers' Company have voted £100, and the Mercers' Company £52 10s., in aid of the Queen Charlotte's Lying-in Hospital, Marylebone Road.

CORRESPONDENCE.

THE INDEX MEDICUS.

SIR,—I trust you will kindly find room for the following correspondence, which makes quite clear how this important question now stands. I beg leave to ask through the medium of your pages that those members of the profession who realise the paramount importance of keeping this publication alive will at once communicate with me if they are willing to subscribe the amount named by Dr. Billings and Dr. Fletcher. Twenty-five dollars (£5) is, of course, a rather large sum for individuals to subscribe, but it should be easy for workers to form groups of five who would subscribe £1 per annum, and in return receive a copy of the *Index* for common use. As regards institutions and societies, it is such an obvious duty to support the *Index* that the money should be voted without hesitation. I earnestly beg that the officers of the various medical societies of the country will bring this question before their committees at the earliest possible moment, and enable me to write to Dr. Billings and tell him that the estimated support from Great Britain has been secured.—I am, etc.,

J. Y. W. MACALISTER,

Resident Librarian of the Royal Medical and Chirurgical Society,

Hanover Square, W., July 19th.

War Department, Library of the Surgeon-General's Office, Washington, D.C., July 28th, 1895.

MY DEAR MR. MACALISTER,—I have just seen in the *Lancet* and in the *BRITISH MEDICAL JOURNAL* of June 20th your friendly communication about the *Index Medicus*, which I highly appreciate. I have not yet received the letter which you mention as about to be written to me, but the suggestions in your communication to the journals correspond to the conclusions I had arrived at, and which are embodied in the enclosed copy of a letter which I am sending to friends in the larger cities. My estimate is that 125 subscriptions of 25 dollars each can be obtained in the United States, 60 subscriptions in Great Britain, and 20 in France and Germany. This last may be excessive but we can make up the balance. It is my impression that the quarterly form will be preferred by the majority of users, but on this point I shall be glad to have your opinion. Thanking you for what you have done, and hoping that you will continue, I remain, yours sincerely,

J. Y. W. MacAlister, Esq., Resident Librarian,
Roy. Med. and Chir. Soc., London.

JOHN S. BILLINGS.

Washington, D.C., July 28th.

DEAR DOCTOR,—After considerable correspondence on the subject of reviving the *Index Medicus*, we think that the following plan is the most feasible:

The cost of producing the work is about 4,500 dollars per annum, but as the amount of medical literature is increasing it is safest to put it at 5,000 dollars. It is proposed to try to get 200 subscriptions at 25 dollars each. Only 202 copies will be printed, no exchanges will be made, and there will be no advertisements. The subscriptions are to be paid in advance for one year to either of the undersigned. When 200 subscriptions have been received the list will close and the work will commence. It is thought that the first number may appear in November. If by December 1st the 200 subscriptions have not been obtained the money then received will be returned to the subscribers and the attempt will be abandoned.

If you approve of this plan will you endeavour to procure subscriptions in accordance with it? Please also express your opinion, and that of others whom you may consult, as to the advisability of changing the form of the *Index Medicus* from monthly to quarterly.—Very respectfully,

JOHN S. BILLINGS, M.D.,
ROBERT FLETCHER, M.D.

THE ROYAL MEDICAL BENEVOLENT COLLEGE.

SIR,—In reply to "A Branch Member," I hope that you will allow me to point out that the funds of the Branches are distinct from the general funds of the Association, and that while the latter can be distributed only as provided by the Memorandum of Association, the former can be spent by the Branches as it may seem good to them. The granting of charitable donations by the Branches is therefore not illegal.

The Branch funds are not, as a rule, very large, and are quite insufficient for the effective carrying out of medical defence. Independent action on part of Branches in this direction would be not only unconstitutional, but tantamount to the formation of a large number of small defence societies, and would be productive of but little good.

The British Medical Association is neither a shadow nor an abstraction, as "A Branch Member" would have us believe, nor is the work of the Council purely formal. Such an expression of opinion indicates complete ignorance of the working of the Association. "A Branch Member" is no better informed when he proceeds to criticise the action that many Branches have already taken in calling upon the Council to

take such steps as may enable the power of the Association to be used for the maintenance of the honour and interests of the medical profession. It is not because the Branches refuse to "put their own shoulders to the wheel" that these resolutions have been passed, but because if the proposed reform is to be effected it can only be done by and through the Council. Any independent action on the part of the Branches would be entirely out of order. What the Branches can do is to urge the reform upon the Council, and more than half the home Branches have already done so.

Although the maintenance of the honour and interests of the medical profession is stated to be one of the two objects of the founders of the Association, yet they omitted to provide in the Memorandum of Association any means of effecting this object. Consequently the work of the Association has been seriously hampered. It is to remedy this unfortunate oversight that the Council of the Association will be asked at the approaching annual meeting to take such steps as will enable the second great object of the Association's existence to be effected; and those who have the interests of our profession at heart will, I hope, attend the meeting and support the resolution which will be moved.

Finally, may I point out to "A Branch Member" that an elementary acquaintance with what is to be criticised is at least one of the essentials of a good critic?—I am, etc.,

Dorset, July 26th.

A. G. WELSFORD.

CHELSEA HOSPITAL FOR WOMEN.

SIR,—I see in the BRITISH MEDICAL JOURNAL of July 20th that it is stated in reference to the Chelsea Hospital for Women that the Board of Management had itself taken the responsibility of making an appointment to the staff of the hospital in disregard of the recommendations of its Medical Committee of Selection. I wish to say that in reply to my questions at the general meeting of the hospital held on June 26th, when the Governors were asked to confirm the elections to the staff, the Chairman stated that the recommendations of its advisory Medical Committee had been followed in every single instance, and that it was untrue to state that the advisory Medical Committee were dissatisfied with the way in which their recommendations had been received.

I hope in the interests of the hospital the matter may be publicly cleared up.—I am, etc.,

July 26th.

A. J. MYERS,
A Governor of the Hospital.

* * The statement that the Board of Management had made appointments to the staff of the hospital in disregard of the recommendations of their Medical Committee of Advice was originally made in the BRITISH MEDICAL JOURNAL of January 28th, p. 216, and has never been contradicted or questioned. We certainly think that some explanation is due from the Board.

THE PROFESSION AND MEDICAL AID SOCIETIES.

SIR,—We are directed to inform you that a meeting of the medical profession in Eastbourne, called by the invitation of the local medical society, has been recently held for the purpose of considering proposals for the formation of a provident medical association, in order to combat the growing evil of commercial "medical aid societies" in this town. At the meeting it was resolved that an association should be started upon the following lines:

1. All duly qualified resident medical men not practising as homoeopaths to be eligible for the acting staff, subject to the approval of the committee.

2. The committee to be exclusively a professional one, consisting of the staff and a certain number of members appointed by the Eastbourne Medical Society.

3. A wage limit or other check to abuse to be adopted, and

4. The profits, after payment of working expenses, to be divided amongst the acting staff proportionately to the number of members upon their respective lists.

The following resolutions were also adopted:

1. That every medical man in Eastbourne be invited to sign a statement agreeing neither to accept any appointment himself to any "medical aid" or similar society, nor to have any professional intercourse whatsoever with any medical practitioner holding any appointment in, or associating himself in any way with, any of the so-called "medical aid

societies," or with any similar company, so long as the methods adopted by those societies include (a) canvassing for members in the interest of individual practitioners, (b) the virtual "sweating" of their medical officers by the inadequate remuneration for the work done.

2. That, considering the necessity for permanently maintaining united action on the part of the profession towards these medical aid societies, this meeting approves the plan of requesting the Committee of the Eastbourne Provident Medical Association to depute one of its members to call upon every new medical practitioner settling in Eastbourne with the object of warning him against the methods of the medical aid societies, and of courteously inviting his signature to the above agreement.

3. That the British Medical Association be requested to approach the deans of the various medical schools in the United Kingdom and urge them to point out to their senior and recently-qualified students the very objectionable character of these medical aid societies. (b) That the Royal College of Surgeons of England and the Royal College of Physicians of Ireland have both expressed in clear terms their disapproval of their diplomates associating themselves with these societies. (c) That the Committee appointed by the General Medical Council to inquire into the working of these societies in relation to the medical profession unanimously condemned their methods. (d) That by accepting appointments in these societies medical practitioners will cut themselves off from their professional brethren.

It was further agreed to send copies of these resolutions to the medical journals in the hope of warning inexperienced junior practitioners who might otherwise accept posts under medical aid societies in Eastbourne.

The following practitioners signed the agreement embodied in the first resolution: James Adams, A. K. Barnes, D. Matthews Browne, Chas. H. H. Cameron, Henry Colgate, Wm. J. Daly, J. N. d'Esterre, E. Downes, Frank Elvy, J. H. Ewart, H. D. Farnell, Kenneth Frazer, Henry Habgood, C. O'Brien Harding, A. Harper, Charles N. Hayman, H. A. Hinds, Henry J. Holman, Otto Holst, G. H. Jackson, J. Talfourd Jones, Thos. MacQueen, Fredk. Marsdin, William Pollock, Astley Roberts, Charles Roberts, A. Edw. Rook, Arthur P. Sherwood, A. R. Sieveking, George P. Skinner, Wm. Muir Smith, A. Wheeler Taylor, Rich. Watts White, Neville S. Whitney, and Edmund Willett.—We are etc.,

J. H. EWART,

President Eastbourne Medical Society.

A. HARPER,

Hon. Sec. pro tem. Eastbourne Prov. Med. Association.

Eastbourne, July 22nd.

REGISTRATION OF MIDWIVES.

SIR,—The result of the debate upon this question at the annual meeting of our Association will be looked for with anxious interest by the whole profession. The point of first importance is united action, and so far as the authors of the various resolutions already published are concerned, this is assured, each and all indicating a desire to remove the recognized evils of the present practice of uneducated and ignorant "midwives," to afford protection to "the poor mothers of England," and to protect the interest of the profession. The position has been made most difficult by the extraordinary action of the General Medical Council. This body is looked upon as the "supreme authority on all matters of medical education," but it has thrown the profession away. Intimidated by the Midwives' Institute, and alarmed lest they might incur the disfavour of a small section of London society they have not only stultified their own action, but have also done an act they had no legal authority for, namely, given their sanction to the Obstetrical Society of London to grant a midwifery certificate. It is incredible that the Council should have given way to the pressure of a few lay agitators, but several of its members have over again declared that something must be done because the registrationists say the evils of "midwives" practice are so great they therefore set about to consider the "wretched Bill" of which we have heard so much, although they averred that its vaunted object, namely, to provide cheap and efficient help to the poor women in time of their labour was in no way provided for in the measure. How much respect the promoters of the Bill or the Legislature have for their fashion attempt to modify its clauses is shown by the fact that in the amended Bill which was dropped by the House of Lords just before the dissolution of Parliament the alterations proposed by the Council were completely

ignored. They timidly suggested that the worthless documents they have been compelled from time to time to condemn should not be legalised; but the agitators were more courageous, stuck to their demands, and kept in the objectionable clause. In fact, the Council have been completely beaten by the Midwives Institute. This being so, it is perfectly clear we must act without any regard to the General Medical Council or the expressed opinions of the majority of its members. If we are to have a Bill at all, a "midwife" or midwifery nurse should be defined as "a woman who attends a case of natural labour under medical control, and personally undertakes the subsequent nursing of the mother and child." This is what the public understand by a midwife, but the registrationists will not like this clear definition of her duties.

We are promised early reform of the Poor Laws, and it would seem almost wiser that we should wait to see what proposals are made in this direction before proposing legislation for amending or repealing but a small part of the Poor-law system.

Old age pensions are to form a part of the proposed reform. This is simply another form of parish relief. I have long ago pointed out that a poor person receiving State help is far worthier than one who accepts charity, yet we have been constantly told by the advocates of the "new midwife" that she is necessary, because the State medical service is not sufficiently high toned for the class of women it is provided for. What makes the services of the district medical officer so distasteful is that the order for his attendance must be got from the relieving officer. Surely it would be a very easy matter in the contemplated reforms to adopt some more acceptable system.—I am, etc.,

Old Trafford, July 22nd.

JAS. BRASNEY BRIDGLEY.

THE INOCULATION OF TUBERCULOSIS BY TATTOOING.

SIR,—In the BRITISH MEDICAL JOURNAL of June 20th there appeared a letter from Dr. Vincent D. Harris, in which he points out that our notes on the cases of "Inoculation of Tuberculosis following Tattooing" do not conclusively prove that such was the case. We do not hold that the suppuration must have been due to the presence of tubercle bacilli, nor was the enlargement of the epicondylar and axillary glands a point which influenced us in our diagnosis. Is it not likely that the saliva itself, as well as containing tubercle bacilli, also contained pyogenic organisms, or that these subsequently found their way into the wounds from the surrounding skin or from the linen. We have had opportunities both at home and abroad of studying tattooing, and have repeatedly known "sore arms" follow it. These mostly consisted of simple cellulitis, which we have always found allayed by ordinary treatment in a few days. In these cases the glands in the neighbourhood were almost invariably enlarged. Normally, after a surface of any extent is tattooed, slight inflammation follows, the area being swollen and raised above the surrounding skin, with sometimes enlargement of the neighbouring glands. This, however, rapidly subsides, and is due probably either to the irritation of the pigment or the damage done to the tissues.

As to whether the ulcers which were left in J. H.'s case after the scabs were removed were typically tuberculous or not matters little, as any local tuberculous manifestations most likely would have been modified for the time by the local irritation due to the aforementioned causes. This was the only case in which ulceration took place and the ulcers rapidly granulated up and skinned over, as on December 10th, that is two months afterwards, when shown at Mr. J. Hutchinson's museum, they were, to use Mr. Hutchinson's own words "simply inflamed patches of swollen skin."

In one of the cases of tuberculous inoculation following tattooing already on record and in which bacilli were demonstrated ulceration was present. In this case, reported by Dr. Jadassohn, a phthisical man tattooed a healthy woman, using saliva to mix the pigment. Scabs formed, which, on being removed brought into view a "shallow sharp-bordered ulcer." The ulcers which we characterised as deep were deep because the edges were raised above the level of the surrounding skin. We examined the sections

microscopically and came to the conclusion that they were tuberculous, but, to make assurance doubly sure we sent a piece of skin to the Clinical Research Association's laboratory, and a slide was returned with the following report:

In each section examined there were tubercles in the corium immediately under the Malpighian layer. Two or three typical giant cells were seen in each section, and, although it is doubtful whether tubercle bacilli existed in the nodules yet the tuberculous nature of the lesion admits of no question.

The sore arms gave the boys very little trouble, and we had the greatest difficulty after the first week or two in making them attend with anything approaching regularity. The parents would not hear of surgical interference. The last opportunity we had of seeing them was at the beginning of January last, and then the condition was practically the same as when shown at Mr. Hutchinson's museum. It must be remembered that this was more than three months after the operation. Our diagnosis was based on the following:

1. The tuberculous appearance and chronic nature of the lesions.
2. The stubbornness to yield to simple treatment which was persevered with for some weeks.
3. The operator was in the last stage of phthisis when he pricked his saliva into his victims.
4. The similarity in the cause, appearances, and course of three lesions in three different persons.
5. The fact that from the time the acute symptoms (which lasted for about fourteen days) subsided until more than three months after the operation, the lesions were practically *in statu quo*.
6. The result of the microscopical examination. The fact that no bacilli were found is rendered of less moment owing to the well-known difficulty in demonstrating these in lesions of the skin.

In spite of the extreme difficulty we have had in following up the cases, we hope to be more successful in the future, if only to be able to record the appearances of the lesions and their effect on the lives of their possessors.—We are, etc.,

D. W. COLLINGS,
W. MURRAY.

Tottenham, July 6th.

HEALTH INSPECTIONS IN PUBLIC SCHOOLS.

SIR,—The subject of the spread of contagious diseases in public schools has been of late largely discussed. Reading from time to time much matter adverting to it, I have been struck with the need there exists for careful weekly health inspections in all public schools by the attendant medical officer, so as at once to identify any contagious or infectious disease and adopt measures for isolation. Such periodical health inspections by medical officers are ordered for military bodies; why, therefore, should they not be carried out in public schools? I am not aware (I write, though, on this point subject to correction) that any such system exists in schools. A disease may often be well advanced before a boy thinks of complaining to such an extent as would draw the attention of the master or medical attendant to the illness. A paper read by Dr. Clement Dukes before the College of Preceptors on November 21st, 1894, which appeared in the *Educational Times* of December 1st, 1894, might be studied with much profit by medical officers of schools, whose inspections should have the twofold object of being both medical and sanitary. Even in this admirable paper I see no allusion to the advantage, or even need, of any periodical health inspection for the early detection of disease. Dr. Clement Dukes's admirable scheme for the inspection of schools from the medical and sanitary point of view was pronounced by the Chairman at the meeting to be "a *beau idéal* which should be kept in view as far as possible, though no teacher could be expected to carry it out thoroughly."—I am, etc.,

July 6th.

M.D.

ABUSE OF HOSPITALS.

SIR,—As the prevention of hospital abuse is largely in the hands of the medical profession, the following plan has been tried at a provincial hospital: Patients who are plainly objects of charity receive advice and treatment. Those who are supposed to be in good circumstances are examined; the name of their usual attendant is obtained; a paper stating

the diagnosis and the treatment recommended is handed to them, and they are advised to return with it to their own doctor and continue under his care. Most patients are satisfied with this, and many medical men appreciate the system. Some, however, scold the patient for having gone to hospital and so lose the case, while others regard the hospital diagnosis and recommendation as reflecting on their skill and take offence. Thus, a system which has many advantages is rendered by the men who alone gain by it a source of irritation to the patients who submit to it and to the doctor who takes the trouble to carry it out.—I am, etc.,

July 2nd.

PROVINCIAL.

NAVAL AND MILITARY MEDICAL SERVICES.

ARMY MEDICAL STAFF EXCHANGE.

The charge for inserting notices respecting Exchanges in the *Army Medical Department* is 2s. 6d., which should be forwarded in stamps or post office order with the notice. The last post on Wednesday is the latest by which these announcements can be received.

A SURGEON-MAJOR with about two years' more home service wishes to exchange with an officer who has partly completed a tour of service in India; Bombay preferred.—Apply Respite, Messrs. Holt and Co., Whitehall Place, London.

ARMY MEDICAL STAFF.

SURGEON GENERAL ROBERT BOWEN died at Weston-super-Mare on June 15th. He entered the service as Assistant Surgeon May 18th, 1841; was appointed Surgeon, December 28th, 1851; Surgeon-Major, May 18th, 1861; Deputy Surgeon-General, March 9th, 1867; and Surgeon-General, April 29th, 1870. He retired on half-pay, June 24th, 1877. We learn from *Hart's Army List* that he served in the Kaffir war of 1846-50 (medal), and acted as Principal Medical Officer to the expedition against the Kaffir chief Krell, in August, 1859; was shipwrecked in her Majesty's ship *Barbadoes* off Danger Point, Cape of Good Hope, February 24th, 1862; and was in the Eastern campaign of India, including the battles of Alma and Inkerman and siege of Sebastopol (medal with three clasps, and Turkish medal), was acting Principal Medical Officer of the 4th Division during the march from Old Fort to Goshawk's Hill, and for a short time afterwards.

Brigade-Surgeon-Lieutenant-Colonel ROBERT NELSON MALLY died at (Glen), county Sligo, on July 7th, aged 50. Appointed Assistant-Surgeon (October 2nd, 1860), he became Surgeon, March 1st, 1873. Surgeon-Major, October 2nd, 1877, and Brigade-Surgeon-Lieutenant-Colonel, December 29th, 1880, having obtained the rank of Lieutenant-Colonel, October 2nd, 1886. During the Zulu war in 1879 he had medical charge of the 2nd Battalion and Buffs and the 3rd Battalion 60th Rifles, and of the troops at the Bank Umvolos River. He had received the South African medal with clasp.

Surgeon Colonel SAMUEL ANCHES is placed on retired pay July 9th. He entered the service as Assistant Surgeon August 3rd, 1858; became Surgeon, March 1st, 1861; Surgeon-Major April 1st, 1873; Brigade-Surgeon (October 18th, 1874), and Surgeon-General from November 2nd, 1889. He was attached to the 101st Fusiliers with the Egyptian Field Force on the North-West Frontier of India in November and December, 1883, and was present at the storming of the Central Hill and the destruction of Umhaplah (medal with clasp); served with the Nile Expedition in 1885 in charge of the field hospital at Korti (medal with clasp and Khedive's star); and with the Sudan Frontier Field Force in 1889-90 in medical charge at Wady Halfa and of the line of communications to Akashah.

INDIAN MEDICAL SERVICE.

THE following promotions, which have already appeared in the *BRITISH MEDICAL JOURNAL*, have received the approval of the Queen, dated March 24th. Madras Establishment—Surgeon-Majors G. T. THOMAS, A. J. SUMNER, and ANDREW ADAMS, M.D., to be Surgeon-Lieutenant-Colonels; Surgeon-Captain A. O. EVANS to be Surgeon-Major. Bombay Establishment—Surgeon-Majors A. H. C. PANE, M.D., J. P. CHRYST, M.D., G. E. F. A. JONES, and JAMES McCLELLAND to be Surgeon-Lieutenant-Colonels; Surgeon-Captains M. A. T. COLLIER and W. H. QUICKER to be Surgeon-Majors.

Mr. Murray has also announced the retirement from the service of Surgeon-Colonel A. PORTER, M.D., Brigade-Surgeon-Lieutenant-Colonels A. E. HARRIS, P. E. MARSH, M.D., and Surgeon-Major DONALD BROWN, all of the Madras Establishment, and of Surgeon-Lieutenant-Colonel G. E. H. BARNARD of the Bombay Establishment.

Surgeon-Lieutenant-Colonel G. E. BARNARD, Bombay Establishment, met his end from the service July 15th. He was appointed Assistant-Surgeon, March 1st, 1861, and became Surgeon-Lieutenant-Colonel March 1st, 1867. He was in the Afghan war in 1842, and was present in the engagements at Poonah and at the battle of Chinghar and Chinghar, at the defence of Candahar, and at the battle of Candahar (medal with clasp).

Surgeon-Lieutenant-Colonel H. HYATT, Madras Establishment, has also retired from the service from July 15th. His appointment as Assistant-Surgeon, Madras Establishment, 1st, 1861; and as Surgeon-Lieutenant-Colonel twenty years later.

ARMY MEDICAL RESERVE.

Surgeon-Lieutenant W. G. CHURCHILL, M.D., is promoted to be Surgeon-Captain July 2nd.

THE VOLUNTEERS.

SURGEON-LIEUTENANT W. MCKELLAND, M.B., 9th Lancashire Artillery, has resigned his commission, July 2nd.

MR. HERBERT ARTHUR REEDER is appointed Surgeon-Lieutenant in the 2nd (Berkshire) Volunteer Battalion the Northamptonshire Regiment, July 2nd.

Surgeon-Major P. E. HILL, 1st (Berkshire) Volunteer Battalion the North Wales Borderers, is promoted to be Surgeon-Lieutenant-Colonel, July 2nd.

MR. ALFRED CROUCH TERNALL, M.D., is appointed Surgeon-Lieutenant in the 1st Tower Hamlets Rifles, July 2nd.

Surgeon-Lieutenant-Colonel P. H. WATSON, the Queen's Rifles Volunteer Brigade the Royal Fusiliers, is appointed Brigade-Surgeon-Lieutenant-Colonel in the 4th Brigade Volunteer Infantry Brigade, July 2nd.

Surgeon-Lieutenant-Colonel T. L. GENTLES, 1st Volunteer Battalion the Derbyshire Regiment, is appointed Brigade-Surgeon-Lieutenant-Colonel in the North Midland Brigade Volunteer Infantry Brigades.

THE MEDICAL STAFF IN THE CRIMEA.

Two recently published books—namely, *The Crimea in 1854 and 1855*, by General Sir Evelyn Wood, and *The Story of the Highland Brigade in the Crimea*, by Lieutenant Colonel A. Sterling—contain allusions to the Medical Department that will be read with amusement and interest. The bungling of the medical arrangements and their breakdown during that war are now matters of history. Sir Evelyn Wood speaks of the medical officers as "being of a high social class, many having entered the service with excellent professional qualifications, but points out that, owing to a different department holding and issuing drugs, and the manner this department treated the requisitions of medical officers, "it had come to be understood, at least by some, that a medical officer was valued in inverse ratio to his demand for drugs and medical comforts."

Sir Evelyn Wood comments on the ignorance of Ministers and the public about military affairs in those days, and gives an example where in the House of Commons "passages were set down as 'for the conveyance of the sick,' and of such a 'statement being amended.' He also says that when cholera was raging in one division on August 1st there was no wine, brandy, arrowroot, or sago. There was a small reserve at headquarters, but the medical officer in charge of the division had been admonished in July to demand less medical comforts, as he had asked "for more of one article than the whole amount of the reserve supply." The same medical officer having demanded urgently a particular drug, was answered that, "as it did not make an araba (country waggon) load, it could not be sent unless he supplied a man to carry it the few miles intervening between the division and headquarters."

Lieutenant Colonel Sterling in his work goes for the doctors, and accuses them of conniving at economies by putting sick soldiers on low diet, so as to save something to the Treasury out of hospital stoppages. Miss Nightingale also receives some notice of a sneering character, while the author does not fail to complain of many effective soldiers being withdrawn from the ranks for hospital work.

ARMY SANITATION.

REFORMER adverts to the new regulation by which the Royal Engineers are to submit the condition of newly constituted or repaired drains to the judgment of the Medical Department as a step in the right direction. The same order, he says, practically gives the Royal Engineers away, by ruling that competent civilians may be called in, if necessary, for the carrying out of sanitary works. The late War Minister did, indeed, state that Mr. Tyndale was always available at headquarters for consultation on sanitary matters; but how often was that gentleman's opinion or supervision asked? The Royal Engineers' regulations (paragraph 60) enjoin that, on the initiation of sanitary work, it is to be submitted to headquarters through the senior medical officer of the district, a regulation notoriously more regarded in the breach than in the observance.

OUTFIT FOR MEDICAL STAFF.

We stated lately that about £50 should cover the cost of uniform, but some correspondents place the outfit at £70, £80, or even £100. Outfit is, of course, an elastic term, and may be held to include other clothing besides uniform, and also barrack furniture, and even sanitary. Of course if a variety of items are included, then £50 would not be too much.

CORRUPT PRACTICES.

Our contemporary, *Truth*, under the head of "Corrupt Practices at 13, Victoria Street," makes grave allegations, which either ought not to be made, or if made, should certainly be cleared up. Such charges cannot rest as they are.

BRIEF LIFE.

A MILITARY contemporary, says otherwise, ridicules the idea of requiring a medical officer for promotion on account of want of knowledge of service regulations, apparently on the ground that a doctor may have nothing to do with anything but doctoring. The effect of such misstatement is to prepare the public for the conversion of the Army medical department into a civil body, with no power in hospitals or elsewhere. The great military Powers of Europe possess, and a policy exactly the contrary, and endeavour to cultivate the military interest in medical officers; our system is to make it impossible for military surgeons to exercise command. At best only a smattering of military instruction can now, under a reduced term, be imparted at Aldershot.

THE INDIAN MEDICAL SERVICE.

A WELL-INFORMED correspondent writes that attention in the existing constitution of the Indian Medical Service and Army system had most recently received the attention of the India Office. Some arrangements

Lancet, vol. CXXV, p. 115, debate on Vote of Credit.

lead neither to harmony nor efficiency; the interchangeability of medical officers between civil and military appointments is anomalous and irregular. The regulations for promotion of Brigade Surgeons who may have passed posts in civil service to administrative berths in the army are absolutely inefficient to insure administrative efficiency. This was pointed out by Sir James Dornier, when Commander-in-Chief in Malacca, and afterwards also, in 1889, placed on record the opinion that "it would be of essential benefit to civil and military interests if the Government would create a distinct civil medical service for India, quite independent of the army." If in the Staff Corps two years' post-service civil employ disqualifies for command, a similar rule should be extended to posts of military medical administration. Yet we find medical officers employed in civil capacities for almost twenty years unobtrusively turned into responsible posts of military administration. Complete separation of the civil and military branches is advocated in incidental quarters, leading, of course, to fusion of the latter with the Medical Staff, and a single door of entrance. The civil branch should be part of the Civil Service, and recruited through competition embracing Indian graduates. The present "loan system" has been authoritatively pronounced as unsatisfactory in motivation.

* There are two sides to this question, and some years ago we discussed them, showing both the advantages and drawbacks to a separation of the civil and military branches. It is a matter embracing policy as well as finance and efficiency. The great advantage of the "loan system" is, of course, the hold the Government retains upon all medical officers whatever in the event of sudden military emergency. But we think this might be retained even in a purely civil service, for if it came to the worst, every European in India must play the part of a soldier. The chief drawback is the impairing of military efficiency by the long divorce from military duties involved in civil employment. The separation of the service into civil and military would facilitate the entrance and employment of native graduates, who for reasons of State cannot enter the Army Medical Staff. The entire question must be approached and considered from the threefold aspect of policy, efficiency, and finance; but we trust the historic continuity and splendid traditions of the Indian Medical Service may in any change be as much conserved as possible.

MEDICO-LEGAL AND MEDICO-ETHICAL.

DEATH OF A PATIENT AT THE HOLLOWAY SANATORIUM.

MR. WILLIAM COURT GULLY, Q.C., M.P., has issued his report of an inquiry which was ordered by Mr. Asquith, when Home Secretary, into the cause of the death of a patient named Thomas Weir at the Holloway Sanatorium, St. Ann's Heath, Virginia Water, a registered hospital for the insane. Mr. Gully was assisted in his inquiry by Dr. George H. Savage, and both the relatives of the deceased and the committee of the hospital were represented by counsel. Weir, it will be remembered, had, for a considerable time previous to his death, been confined in an apparatus called the "dry pack." Mr. Gully reports that at the time of the inquiry he was informed that the dry pack was no longer used in the form in which it had been used upon Weir, and the apparatus had been destroyed. The new method of restraint now employed in its stead he considered to be a great improvement upon the abandoned process. Two questions arose to Weir's treatment: (1) Was the "dry pack" proper treatment? (2) Was it administered with proper care and precautions? He was advised by Dr. Savage that "dry pack" administered for a short time, say two to four hours, and with proper supervision and precautions, was a useful remedy in cases of mania both as a curative and as a restraining process; and, subject to those conditions, he thought Weir's case was a proper one for its application. But he was of opinion that such restraint continued from Wednesday to Sunday in such a severe and trying apparatus, and with such short intervals of freedom as were allowed, was dangerous and excessive, even if all proper precautions were taken. In Weir's case almost every ordinary and proper precaution seemed to have been neglected. No attendant was told off to sit with the patient and watch him either by night or day; no special directions were given to the attendant by the medical officer as to food, exercise, watching, stimulants, or any other matter, and though it was admitted the case required special care and frequent visits, about twenty-four hours elapsed on one occasion without Weir being seen by any medical man. It was impossible to avoid the conclusion that at the time in question, not only was there an insufficient medical staff, but there was also a total absence of that systematic watchfulness, discipline, and supervision which were absolutely necessary in a great hospital for the insane, and that those deficiencies largely contributed to cause the death of Thomas Weir. It was fair to add that the Committee of the hospital were, he believed, anxious to conduct the institution on humane and liberal principles, and to spare no pains to make it a first-class establishment for the several classes of patients for whom it was intended. And he had no reason to doubt that Dr. Phillips as medical attendant wished to carry out the Committee's views, but the administration of so large an establishment left him very little time for purely medical work or for the supervision of medical officers or attendants.

FEES TO MEDICAL WITNESSES.

J. W. N. writes: I have recently had to attend the assizes as a medical witness in a case of manslaughter. I had to leave the station here at 9.37 A.M. on three days, Friday, Saturday, and Monday; on the first two days I reached the station here at 5.53 P.M., and on Monday was released in time to get here at 12.43 P.M. The fee paid was one guinea per diem; total, with allowance for expenses, £3 12s. 10d. I have already written a protest to the judge, but I am in hopes that some united action may be taken by members of the profession with the

object of obtaining fees which may more nearly compensate for the expenditure of time and trouble.

* The fee paid was in accordance with the authorised scale, which was settled forty years ago and has never yet been amended in spite of frequent grumbings by members of the profession. A somewhat more liberal scale is in force in Scotland. It might be worth while to represent to the new Home Secretary the inadequacy of the fees now allowed, and to press for an allowance which will in some measure compensate for time lost in the discharge of a public duty. The matter will be brought under the notice of the Parliamentary Bills Committee of the British Medical Association.

TITLE OF "DR."

MEDICUS writes: My qualifications are M.R.C.S. Eng. and L.R.C.P. Lond. Is there anything actionable in my putting "Dr." to my visiting card?

* We believe it not to be an infrequent practice for a medical practitioner, although not entitled to the degree M.D., to prefix the title of "Dr." to his name on doorplate or card. Strictly speaking, however, in the light of not remote decisions it may possibly be that legal proceedings would lie against such practitioner under Section 40 of the Medical Act for so doing, but we doubt very much if on such ground alone legal proceedings would be successful, and we should certainly not recommend their being taken. The question is a vexed one, and has been much discussed in our columns.

W. B. H. inquires if it is really the case that holding the "L.S.A." diploma he can call himself "Dr." and have that prefix on his doorplate.

* Licentates of the Society of Apothecaries have no greater claim to prefix "Dr." to their name than any other legally qualified general medical practitioner. The prefix of "Dr." has been largely adopted as belonging by courtesy to the medical practitioner, but having regard to a recent decision of the High Court (to which we have before had occasion to refer) it would appear to be a matter of doubt whether anyone not possessing a registrable degree of M.D. is, strictly speaking, entitled to call himself "Dr."

TESTIMONIAL TO TRADE PREPARATIONS.

M. B. writes that he received recently a blotting pad from a firm which advertise largely certain preparations of wine designed for the use of invalids. This pad, he states, bore testimonials to the value of the firm's preparations from two members of the medical profession.

M. B. protests, also, against consultants allowing their names to be appended to bulletins in the daily papers.

* As to the first point, we have frequently expressed the opinion that the giving of such testimonials is most undesirable. We have, indeed, so frequently given this opinion, that we are a little weary of repeating it, but may quote the following resolution recently adopted by the Hanoverian Medical Council (Aerztelkammer): "In view of the recent active dissemination of an advertisement of a hygienic toilet soap, the Council considers it to be its duty to call the attention of the medical profession to the fact that the authority of the profession, and in particular of medical recommendations, is compromised seriously by such recommendations. Only the strong determination never, and under no circumstances, to place in the hands of a manufacturer a written expression of opinion as to a secret remedy, can protect a medical man from the misuse of his name."

As to the second point mentioned by "M. B.," a carefully considered expression of opinion was published in the BRITISH MEDICAL JOURNAL of January 6th, 1894, p. 20.

UNQUALIFIED PRACTICE.

A MEMBER writes: We have here a man in charge of a surgery with "Surgery" printed on the window. He prescribes for patients inside but does not visit. He does not hold a diploma. Could anything be done to remove the "Surgery" from the window, as people in the neighbourhood think he is legally qualified.

* We think there ought not to be much difficulty in procuring sufficient evidence in such a case to authorise proceedings being taken under Section 40 of the Medical Act, 1859, for wilfully and falsely assuming a medical title. Anyone may take these proceedings in a magistrate's court.

If evidence of prescribing for patients, in two or three instances, were furnished to the Clerk to the Society of Apothecaries, B.L.S. Officers, London, we have no doubt that that Society would be willing to take proceedings against the person in question, under the Apothecaries Act.

It must be shown that the unqualified practitioner has prescribed for patients requiring medical (as distinguished from surgical) treatment, and has compounded and supplied medicines for their cure or relief, for gain.

ANÆSTHETISTS AND UNQUALIFIED DENTISTS.

J. F. R. writes: Is it unprofessional conduct for a registered medical man to give gas or any other anæsthetic at the house of dental esta-

institutions which are not recognised by any registering body in the United Kingdom.

* The question raised by our correspondent is a delicate one, and an expression of a "pious opinion" by the General Medical Council would be valuable and would probably be adopted by all anesthetists as a guide to their actions. Our own opinion is that medical men should not administer anesthetics for unregistered practitioners, whether medical or dental, nor for registered dentists who are guilty of the unprofessional conduct of advertising, and certainly not for "the institutions" that are found throughout the country but to which no practitioner's name is attached, and evade the provisions of the Dentists Act. Anesthetists might with advantage refuse (even at a patient's request) to administer anesthetics for unprofessional practitioners. It is difficult for patients to understand that there is any difference between registered and unregistered if the same anesthetist is found at both. In London these gentlemen who are known to administer for illegitimate are usually ostracised by the legitimate practitioners.

UNIVERSITIES AND COLLEGES.

UNIVERSITY OF EDINBURGH.

EXAMINATIONS.—The Second Professional Examination for Degrees in Medicine began on July 17th, when the written papers on Anatomy and Physiology were set. On July 18th Materia Medica and Pathology, and later in the day the oral toxic examinations were taken up. The First Professional Examination began on July 20th with Practical Chemistry, followed on July 21st by Chemistry and Botany, on July 22nd by Zoology and Physics, and July 23rd by the oral and toxic examinations.

UNIVERSITY COURT.—This Court met on July 18th. A letter was read from the Secretary of the Scottish Universities Commission, informing the Court that the Statute A. 1. 1890, including the provision for the repeal of the Statute of the M. B. Degree, is now law. A letter was read from Mr. Macdonald, thanking the Court for the letter of sympathy which they had written on the occasion of the death of his uncle, Mr. James Macdonald. The Court appointed the following gentlemen to be the University Lecturers for the Academic Year 1895-96 in the subjects mentioned: Mr. C. M. Douglas, B.Sc., in Psychology; Mr. William Peddie, B.Sc., in Advanced Experimental Physics; Mr. John Beard, D.Sc., in Zoology; Mr. Leonard Dobbin, Ph.D., in Chemical Theory; Dr. Joseph Hillie in Experimental Pharmacology; Dr. Robert Muir, in Pathological Bacteriology; Dr. David Hepburn, in Regional Anatomy; Dr. A. P. Aiken, in Agricultural Chemistry; and Dr. W. G. Smith, in Plant Physiology. On the recommendation of the Senate the Court recommended Dr. Campbell Black, Anderson's College Medical School, Glasgow, as a teacher whose course of instruction in Physiology qualifies for graduation in Medicine. On the recommendation of the Senate the Court recommended Dundee University College as an institution the courses of instruction in which qualify for graduation in Science.

UNIVERSITY OF GLASGOW.

The following have passed the Final Professional Examination for the degrees of Bachelor of Medicine (M.B.) and Master in Surgery (M.S.):

First Examination.—J. A. Stewart, T. Armstrong, F. J. Barker, M.A.; E. Saxtor, A. Blair, H. A. Leckie, T. Campbell, V. E. Chang, H. Davies, W. Donaldson, R. J. Edwards, S. English, J. Findlay, E. M. Fraser, M.A.; G. Graham, W. Hay, B.D.; J. A. Hope, A. B. Hughes, G. Jubb, W. J. Kerr, W. D. Miller, D. McDonald, W. J. Mackinnon, M. N. MacLay, F. Macrae, E. J. Pirbright, M.A.; J. Rankin, J. Sandilands.

Second Examination.—J. A. Stewart, W. Alexander, W. Allan, A. R. Anderson, J. Anderson, J. B. Anderson, L. I. Anderson, W. Baird, R. B. Barr, T. Bell, H. B. Brown, W. Cairns, J. Cairns, W. Cairns, M.A.; F. B. Cormick, S. D. Cowan, M.A., J. Cunningham, J. Irvine, J. H. Douglas, M. Dunning, J. Ferguson, M.A., W. O. Fendley, A. A. Frazer, J. L. Fraser, J. J. Fraser, J. R. Foulds, A. F. Galloway, T. C. Garrett, J. Galloway, M.A., J. D. Graham, J. A. Graham, W. Grove, A. Hall, R. Irvine, G. N. Hunter, J. Jack, J. W. Jackson, D. Kerr, D. C. Kirkwood, J. Kirkwood, W. H. Lang, R. J. W. Lawson, D. Lewis, J. D. Lewis, R. E. Miller, J. M. W. Murray, G. Hoyat, A. C. Muir, J. A. D. M. Murray, D. Murray, J. Murray, D. M. Murray, W. M. Murray, K. I. MacLachlan, H. M. Lazen, W. MacLachlan, J. M. Pherson, M.A., A. R. Oliver, H. A. Patullo, J. B. Rae, J. N. Robertson, W. Rogers, R. H. J. Smith, T. D. Spence, J. Spence, A. Stevenson, H. Stevenson, A. Stewart, A. H. Stewart, J. Glasgow; Emmeline Marie Stuart.

UNIVERSITY COLLEGE, DUNDEE.

The trustees of the late Mrs. Margaret Dunn have determined to carry out the provisions of the University of Dundee Act to establish a new school of medicine at Dundee. A number of their own resources, valued at £10,000, and yielding £100 a year are to be set apart to provide the means of the purchase and lease of the premises of the school. The new building will be completed before the beginning of next session, and the salary will be £200, with a share of the fees.

The trustees are to receive the balance of Mrs. Dunn's estate amounting to some £15,000, and to apply the interest of it from time to time for College purposes.

THE CONJOINT BOARD IN SCOTLAND.

The quarterly examinations in Edinburgh for the Triple Qualification of the Royal College of Physicians, Edinburgh, Royal College of Surgeons, Edinburgh, and Faculty of Physicians and Surgeons, Glasgow, took place in July with the following results:

First Examination, First Year Course.—Of 14 candidates, the following 7 passed:

T. Donovan, E. B. Anderson, D. Sykes, J. W. Thomson, M. P. Rodgers, J. J. Anthony-Park, C. H. Stewart.

Three candidates entered for divisions and passed in one division each.

First Year's Course.—Of 28 candidates, the following 13 passed:

G. F. Stocks (with distinction), W. P. Oliver, J. P. Grant, C. James, G. W. Hardie, E. A. Baker, J. F. Hamilton, T. Neville, H. J. Clarke, J. H. Gibbs, Hilda Maud McFarlane, Jeanette Hamilton Irvine, Emma Bond, G. A. Paulin, J. M. Smith.

Twenty-four candidates entered for divisions and 14 passed in one or two divisions.

Second Examination, First Year Course.—Of 17 candidates the following 12 passed:

G. J. Goldie, B. J. Nolan, P. Brady, J. J. Fuller, P. H. Molony, W. P. Campbell, S. S. Broadbent, J. A. Holmes, R. S. Wells, E. A. Sanders, J. A. Finch, and W. G. Cook.

Ten candidates entered for divisions and 6 passed.

Second Year's Course.—Of 19 candidates the following 14 passed:

R. Mackie, Rosalie Herthorn, Elsie Rosa Crosswell Taylor, Matilda Hetty Grace Russell, J. McGrath, C. F. Ackland, E. H. Sheldon, J. Cotter, T. J. O'Donovan, W. S. Soutar, E. L. Munn, Margaret Grant Campbell Brodie, J. Owens, and J. K. Calder.

Third Examination, First Year Course.—Of 7 candidates the following 4 passed:

E. R. Kitching, A. Cameron, W. Robertson, and J. Dodd.

First Examination.—Of 10 candidates examined for the whole examination the following 5 passed, and were admitted L.R.C.P.E., L.R.C.S.E., and I.F.P.A. & S.G.:

E. A. Purcell, M. T. Archdall, F. G. Bennett, A. E. Clayton, Laura Elizabeth Forsier, Margaret Penelope Munro, P. K. Chitale, C. B. Rossiter, A. L. Levy, J. A. B. Colpo-Belmonte, G. Singh, P. Sullivan, E. F. de Jong, J. W. N. Hudson, K. P. Popat, Sarah B. McMorris, T. J. Kennedy, Lydia Ann Leney, J. Craig, H. Paine, E. H. Givand, Mary Harriet Simson, W. Craig, A. K. Latham, Agnes Lillie Cousins, H. W. Lloyd, H. H. Garsley, C. C. Redgrave, H. Winstanley, W. A. McWhinney, T. Murphy, J. H. Waddington, J. C. Forbes, A. T. Savage, G. A. I. Mackay, E. A. R. Lang, A. Speight, Helen Lauder, E. F. Haslwick.

Twenty-two candidates entered for divisions, and the following completed the examination and received the diplomas:

R. M. Johnson, W. Morris.

One candidate passed in one division.

SOCIETY OF APOTHECARIES OF LONDON.

The following candidates passed in:

Surgery.—J. E. Challice, London Hospital; H. H. Thomas, Charing Cross Hospital; A. E. Lovett, London Hospital; C. A. E. Coultard, St. George's Hospital; M. White, St. Thomas's Hospital; M. G. Jones, St. Mary's Hospital; H. G. Watt, Liverpool; H. Pugh, Sheffield; T. J. Gase, Camb. and St. Mary's Hospital; H. C. T. Dalton, Charing Cross Hospital; J. Cryer, Manchester; and C. W. Moorhead, Guy's Hospital.

Medicine, Forensic Medicine, and Midwifery.—W. B. Maurice, St. Mary's Hospital; T. W. Gale, St. Bartholomew's Hospital; W. S. Dibbs, Leeds; C. M. Headnell, Guy's Hospital; E. M. Gough, London School of Medicine for Women; and H. C. Watt, Liverpool.

Medicine and Forensic Medicine.—C. C. Preston, Manchester; and B. S. Kesteven, St. Bartholomew's Hospital.

Medicine and Midwifery.—H. W. Ramsay, St. Mary's Hospital.

Medicine.—T. E. H. Keogh, St. Mary's Hospital; R. D. Cox, St. Mary's Hospital; and T. H. P. Peers, Charing Cross Hospital.

Forensic Medicine and Midwifery.—A. P. Redford, St. Mary's Hospital; H. W. Silver, Charing Cross Hospital; and H. Pugh, Sheffield.

Forensic Medicine.—G. S. Taylor, Manchester; H. E. De Vall, Birmingham; and J. M. A. Lamb, London.

Midwifery.—G. A. Child, St. Thomas's Hospital.

To Messrs. Challice, Thomas, Lovett, Maurice, Gale, Dibbs, Headnell, Watt, Kesteven, Keogh, Cox, and Peers was granted the diploma of the Society.

PUBLIC HEALTH

AND

POOR-LAW MEDICAL SERVICES.

CASES OF SMALL-POX IN ST. GEORGE'S SOUTHWARK.

In a report recently presented to the vestry of St. George Southwark, on 13 cases of small-pox which occurred during the latter part of June and the early part of July in the district, the medical officer of health points out that the majority of the cases were traceable to infection from a man whose illness was notified on June 23rd, and who had been occupying a convalescent Army shelter in Blackhorse Road.

Dr. Waite visited the shelter on June 23rd, but was refused admission. A patient's warrant was then obtained, and on July 1st a second visit was paid to the shelter, and conditions of overcrowding and inadequate ventilation were found to exist there. The vestry have served notices on the occupier of the shelter, and have directed that proceedings be taken to prevent a recurrence of such cases.

The need of systematic supervision of these shelters has from time to time been made apparent. Cases of the kind referred to in Dr. Waite's report, apart from the knowledge of having such places under a compulsory system to that which is already exercised in the case of common lodging houses.

CHART OF TYPHUS IN DUNDEE SINCE 1838.

By J. W. MILLER, M.D.,

Consulting Physician Dundee Royal Infirmary.

This chart, which shows the variations from year to year of typhus fever in Dundee since 1838, illustrates in a striking manner what can be done for a community by putting in operation measures of public health. For the period antecedent to the adoption of the Notification Act (1838), the numbers represent only the cases treated in hospital, and therefore fall considerably short of the actual number of cases in the town. Subsequent to that date we get the full number.

The great and continued diminution of the disease after the local authority put its powers in operation is especially remarkable when taken along with the large increase of population and with the fact that repeated outbreaks have occurred preventing all the appearance of a threatened epidemic. I have no doubt that other cities which have adopted similar public health measures could tell the same story.

In the Infirmary report (1843-44), under the old name "Intercedes," 565 cases are recorded. There can be little doubt that this was relapsing fever. Watson writes vol. ii. p. 745: "There was prevalent in Scotland (1843-44) an epidemic fever characterized by white discharges, small mortality, short duration, proneness to relapse, frequently occurring petechiae, yellowness of skin, something like black vomit, absence of intestinal ulcers, and by

profuse sweatings whereby fever seemed often to be solved." Probably the cases named "yellow fever" (187-88) were likewise relapsing fever. "Synchus" (the same year) was Cullen's name for a fever "consisting of inflammatory and putrid type intermediate between synchus and typhus."

I was asked if I could say to what extent enteric fever previous to its differentiation from typhus might have fallaciously raised the numbers stated for the latter. I have, therefore, noted at bottom of chart the entire cases for each year since 1837, when this disease first makes its appearance in the Infirmary Register, and it is evident that any disturbing effect in the way suggested would be of no importance.

The meeting of the German Biological and Medical Association will be held at Lübeck on September 1st and five following days. Among the addresses to be delivered is one by Professor Lehning on Antitoxic Serum. Professor Kiedel, of Jena, will give an address on Frig. Surgery. Altogether there will be 33 sections, and 212 papers are announced to be read in them. The Presidents of the Congress are Professors Wilhelmus (Leipzig), v. Ziemssen (Munich), and v. Lang (Vienna). The recreations provided are as numerous as usual, and include a garden *etc.* given by the Senate of Lübeck.

ZYMOTIC MORTALITY IN LONDON.

The accompanying diagram shows the prevalence of the principal zymotic diseases in London during each week of the second quarter of the current year. The fluctuations of each disease and its fatal prevalence as compared with that recorded in the corresponding weeks of recent years, can thus be readily seen.

Small-pox.—The deaths referred to small-pox, which had been 35, 5, and 18 in the three preceding quarters, declined again to 3 during the three months ending June last, and were 21 below the corrected average number in the corresponding periods of the ten preceding years, 1884-94. Of these 3 deaths, 1 belonged to Hammer-smith, 1 to St. Giles, and 1 to Rotherhithe sanitary areas. The number of small-pox patients in the Metropolitan Asylums Hospitals, which had been 63, 18, and 34 at the end of the three preceding quarters, had declined to 33 at the end of June last, 30 new cases were admitted during last quarter, against 457, 79, and 145 in the three preceding quarters.

Measles.—The fatal cases of measles, which had been 300 in each of the two preceding quarters, rose to 561 during the three months under notice, but were 359 below the corrected average number. Among the various sanitary areas of the metropolis measles showed the highest proportional fatality in St. Luke, Shoreditch, Whitechapel, St. George-in-the-East, Limehouse, Mile End Old Town, Poplar, and Battersea.

Scarlet Fever.—The deaths referred to this disease, which had declined from 306 to 141 in the four preceding quarters, rose again to 166 during the three months ending June last, but were 41 below the corrected average number in the corresponding periods of the ten preceding years. Among the various sanitary areas this disease showed the highest proportional fatality in Hackney, St. George-in-the-East, and Rotherhithe. The number of scarlet fever patients in the Metropolitan Asylums Hospitals, which had been 2, 1, and 1 at the end of the three preceding quarters, had risen again to 1,945 at the end of June last. The number of cases admitted into these hospitals, which had been 3,076,

2,148, and 1,461 in the three preceding quarters, increased to 2,390 during the three months ending June last.

Diphtheria.—The fatal cases of diphtheria in London, which had been 631, 653, and 436 in the three preceding quarters, were 416 during the three months under notice, and were 21 above the corrected average. Among the various sanitary areas this disease showed the highest proportional fatality in St. Giles, Rotherhithe, Greenwich, Whitechapel, St. George-in-the-East, Limehouse, Mile End Old Town, Poplar, Camberwell, and Greenwich. The cases of diphtheria admitted into the Metropolitan Asylums Hospitals, which had been 1,163, 1,239, and 561 in the three preceding quarters, rose to 1,177 during the three months ending June last, and 636 patients remained under treatment at the end of the quarter.

Whooping-cough.—The fatal cases of this disease, which had been 205 and 511 in the two preceding quarters, declined to 416 during the three months ending June last, and were as many as 239 below the corrected average number. Among the various sanitary areas whooping-cough showed the highest proportional fatality in Camberwell, Rotherhithe, St. George-in-the-East, Limehouse, St. Saviour Southwark, St. George Southwark, and Newington.

Fever.—Under this heading are included deaths from typhus, enteric fever, and simple and ill-defined forms of fever. The deaths referred to these different forms of "fever," which had been 131, 263, and 135 in the three preceding quarters, further declined to 81 during the three months ending June last, and were 47 below the corrected average number. Of these 81 deaths from "fever," 1 was certified as typhus, 78 as enteric fever, and 2 as ill-defined fever. Among the various sanitary areas the highest proportional fatality of "fever" was recorded in London City and Plumstead. The Metropolitan Asylums Hospitals contained 147 enteric fever patients at the end of June last, against 99, 101, and 73 at the end of the three preceding quarters. 222 new cases were admitted into these hospitals during last quarter, against 172, 183, and 169 in the three preceding quarters.

Diarrhoea.—The six fatal cases of diarrhoea registered in London during

DEATHS FROM ZYMOTIC DISEASES IN LONDON DURING THE SECOND QUARTER OF 1895.

NOTE.—The black lines show the recorded number of deaths from each disease during each week of the quarter. The dotted lines show the average number of deaths in the corresponding week of the preceding ten years 1884-94.

MILKBORNE DISEASE:

AN APPEAL TO MEDICAL OFFICERS OF HEALTH.

MR. FENNER HART is engaged on a general inquiry into milk-borne disease since 1881, in continuation of his paper of that year on the influence of Milk in Spreading Zymotic Disease, and will be much obliged if those health officers who possess notes of outbreaks of disease traceable to the agency of milk will be good enough to furnish him with a brief statement of the facts, so far as known, in the shape of answers to the questions subjoined:

- | | |
|--|--|
| 1. Date. | 8. Number of such families involved. |
| 2. Locality. | 9. Sanitary circumstances of farm or dairy from which milk was obtained. |
| 3. Reporter. | 10. Exciting cause of outbreak. |
| 4. Total number of cases. | 11. Cream-throwing impurities in milk. |
| 5. Deaths. | 12. Facts showing special incidence of disease. |
| 6. Number of cases amongst drinkers of suspected milk. | 13. Reference to report. |
| 7. Number of persons supplied by milkman. | |

ROYALTY AT THE ROYAL FREE HOSPITAL.

Last Monday was a gala day at the Royal Free Hospital, for the new buildings were opened by the Prince and Princess of Wales, and the Princess undertook to accept purses of money in aid of the building fund. The ceremony was a very pretty one, and the object most successfully attained, for no less than £2,000 was raised towards paying off the debt of £3,000. The Princess, accompanied by the Prince and their two daughters, arrived at one o'clock, and were conducted to a platform in the Milne Ward, which, emptied of patients, was crowded with lady medical students, purse holders, and their friends. The Earl of Lathom, Vice-President, read an address of welcome, in which he drew attention to the fact that the Royal Free Hospital was the first hospital to admit the sick poor without letters of recommendation, and the only general hospital which had opened its doors to the women medical students, who now numbered 150, pursuing their studies at the London School of Medicine for Women. The Prince replied in a graceful little speech, in which he said that many members of his family had been interested in the welfare of the hospital. King George IV and King William IV had been patrons, and also the Duchess of Kent, and the Queen before she came to the throne, and that since 1863 he himself had been a vice-patron.

After the speeches 120 purses were presented, many of the purse holders being little children in picturesque dress. The royal party were then conducted over the surgical and accident wards on the ground floor. In the ward devoted to female surgical cases the Princess stayed a long time, and spoke to every patient, and gave each one a flower from the bouquet which had been presented to her earlier in the proceedings.

The women medical students were mustered in the new operating theatre, and it was felt by all of them that this visit of the Princess of Wales was made in sympathetic recognition of the work being done by their school and hospital.

At an examination for inspectors of nuisances, held by the Sanitary Institute on July 19 and 20, at Norwich, twenty-four candidates presented themselves, and fourteen passed.

CHOLERA AT SINGAPORE.—The *Times* correspondent, telegraphing from Singapore on July 20th, states: Cholera has been prevalent among the natives for the past six weeks. Lieutenant C. V. M. Sarel, of the Northumberland Fusiliers, died to-day. He is the first European to succumb.

MR. T. J. REESE, a medical practitioner of Ystradgynlas, Breconshire, was struck dead by lightning on July 21st. He was called upon to attend a case of burning in a neighbouring village, and as he reached the top of a hill known as the Dryn mountain, a thunderstorm came on. Mr. Reese and the horse he had ridden were afterwards discovered lying dead on the summit of the hill by the parent of the patient whom deceased was about to attend, the child's father having accompanied the doctor thus far, and hurried home in advance when the storm threatened.

MEDICAL NEWS.

THE SOCIETY OF MEDICAL PHONOGRAPHERS.—The first general meeting of the Society of Medical Phonographers will be held on Tuesday, July 30th, at 4 P.M., at the house of the Royal Medical and Chirurgical Society. Dr. Gowers, the President of the Society, will deliver an inaugural address. The meeting will be open to all members of the medical profession. The Secretary of the Society is Dr. James Neil, Warneford Asylum, Oxford.

LAW & MEDICINE.—Medicine and law have many points of contact, but it has remained for the members of the two professions in Preston to devise a new field for friendly rivalry. A cricket match played between representative elevens has now become an annual event, and the opportunity is taken to entertain a large number of guests from the neighbourhood. This year the occasion has been, under the directing hand of Dr. George King, more successful than ever, and some thousand persons attended to see the match, which, we are glad to add, was won by Medicine by 121 to 58.

SIR EDWARD LAWSON distributed, on July 18th, the prizes gained by the students of Charing Cross Hospital Medical School during the winter session. The Dean's report stated that in consequence of the fact that a number of students went to practise abroad at the conclusion of their course, it had been decided to establish classes for the study of diseases peculiar to tropical climates. The number of students who had entered during the year was eighty-six, and the daily attendance was 200. The Pereira Prize (certificate and £5) was won by Mr. F. P. Jones; the Governors' Clinical Gold Medal by Mr. D. C. Rees. For anatomy, Mr. W. Green was successful in the senior, and Mr. C. B. Wagstaff in the junior division, the latter also taking a prize for biology. The prize for chemistry was awarded to Mr. J. E. Humphreys, and those for physiology (senior division) to Mr. W. E. Morgan. The award for medicine fell to Mr. Bosanquet; while for surgery Mr. Hudson was successful.

PTOMAINES AND VEAL POISONING.—At an inquest held at Larne, co. Antrim, by Dr. Adams, J.P., coroner, the following facts were brought out in evidence: A healthy calf was castrated on May 25th; it was found to be ill on May 29th, and was killed. The carcass was removed to the house of the butcher in Larne on May 29th, and was sold in quarters to various people on June 1st. Those persons who partook of the hind quarters, whether in the form of soup or jelly, all suffered severely, while those who consumed the fore-quarters did not suffer at all. One of the sufferers—a woman—died. She had eaten the veal fried in butter for breakfast on June 2nd, and boiled into soup for dinner on the same day, and in the form of jelly for breakfast on June 3rd. On June 4th she was seized with intense pain in the bowels, vomiting, and diarrhoea, and died on June 11th. Drs. Killen and Adrain gave it as their opinion that death was due to some irritant in the veal. The stomach and intestines were submitted to Mr. J. F. Hodges, F.I.C., for analysis. He has now succeeded in separating from the viscera and from the veal jelly substances giving similar reactions and belonging to the class of ptomaines. Besides the woman who died six other people in the same house had serious symptoms.

BRITISH GYNÆCOLOGICAL SOCIETY.—At the meeting of this Society on July 11th the discussion on Dr. Fancourt Barnes's paper on some difficulties in the use of the curette was resumed by Mr. H. Bellamy Gardner, who said that hollow metallic dilators, wedge-shaped in longitudinal section, were the best, and that after curetting the cavity should be swabbed with iodised phenol, an iodoform pencil introduced, and the vagina plugged with iodoform gauze. Dr. Routh was glad to hear the sponge tent condemned, and thought laminaria unsafe unless properly prepared. Dr. Heywood Smith recommended Ball's "dredge" curette, or Jessett's modification of it, as by its use complete removal of the diseased tissues could be ensured. Dr. Macnaughton Jones insisted on the need for antiseptic precautions before, during, and after operation, and on the maintenance of sufficient dilatation of the cervical canal. Certain inflammatory states

of the peritoneum and annexa were contra indications. Dr. Granville Bantock considered sponge tents safe if properly applied. Dr. Faneourt Barnes replied on the discussion. Specimens were shown by Dr. Parcell and Dr. Bantock.

MEDICAL VACANCIES.

The following vacancies are announced:

CHESTER GENERAL INFIRMARY.—Visiting Surgeon, doubly qualified. Appointment for two years. Salary to commence £80 per annum, with residence and maintenance in the house. Applications to the Chairman of the Board of Management, Secretary's Office, 22, Eastgate Row North, Chester, by July 25th.

CHESTER INFIRMARY.—House Surgeon. Salary, £80 per annum with board, lodging, and washing. Applications to the Secretary by August 1st.

CITY OF LONDON UNION.—Assistant Medical Officer for the Infirmary at East Road, E. Salary, £100 per annum; single or widower without children. Not under 25 nor more than 50 years of age. Salary, £150 per annum, with furnished apartment, house, and garden. Applications on forms provided to F. W. Crane, Clerk to the Guardians, 61, Bartholomew Close, E.C., by August 2nd.

DR. STEPHENS HOSPITAL, Dublin.—Consultative Surgeon. Applications to the Secretary before August 1st.

DURHAM COUNTY ASYLUM.—Pathologist and Junior Medical Officer. Salary, £100 per annum, with board and lodging. Applications to the Superintendent, Durham County Asylum, Winterton, Ferryhill, by August 10th.

GRAVEREND HOSPITAL.—House Surgeon; doubly qualified. Salary, £100 per annum, with board and residence. Applications to Frederick Mitchell, Secretary, by August 1st.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway Road, N.—Junior House Surgeon. Appointment for six months, board, lodging, and laundry provided. Applications, on forms provided, to be sent to Lewis H. Gosselin Kerr, Secretary, by July 25th.

HOSPITAL FOR WOMEN, Soho Square.—Non-Resident Assistant House-Physician. Appointment for three months. Applications to the Secretary by July 31st.

LINCOLN COUNTY HOSPITAL.—Assistant House Surgeon. Appointment for six months, but eligible for re-election. An honorarium of £10 for each period of six months, subject to the approval of the Weekly Board, with board, residence, and washing. Applications to the Secretary by August 10th.

METROPOLITAN ASYLUMS BOARD.—Assistant Medical Officers at the Flower and Woodstock Hospitals. Salary and emoluments, £160 per annum, rising £60 yearly to £300 per annum, with board, lodging, maintenance, and washing. Must be unmarried, not more than 35 years of age, and doubly qualified. Applications on printed forms provided to be sent at once to T. Duncombe Mann, Clerk to the Board, Norfolk House, Norfolk Street, Strand, W.C.

MORPETH DISPENSARY.—House Surgeon, doubly qualified, unmarried. Salary, £150 per annum. Applications to N. J. Wright, Morpeth, Northumberland, by July 31st.

POPLAR UNION.—Assistant Medical Officer at the Workhouse. Salary, £100 per annum, with furnished apartments and rations in the Workhouse. Applications to G. Herbert Lough, Clerk, Guardians' Offices, Upper North Street, Poplar, E., by July 25th.

ROYAL EAR HOSPITAL, Frith Street, Soho Square, W.—Assistant Surgeon. Applications to Donald Murray, Honorary Secretary, by August 1st.

ST. LUKE'S HOSPITAL, London, E.C.—Clinical Assistant; must be qualified and registered. Appointment for six months, with board and residence. Applications to Percy De Bathe, M.A., Secretary.

STOKE NEWINGTON, CLAPTON, WEST HACKNEY, AND DALSTON DISPENSARY, 120, High Street, Stoke Newington.—Resident Assistant House Surgeon; doubly qualified. Salary, £60 per annum, with board and lodging. Applications to be sent in at once.

TOWNSHIP OF MANCHESTER.—Medical Officer for the No. 2 (Ancient) District; doubly qualified. The gentleman appointed will, if duly qualified, receive the appointment of Public Vaccinator. Applications, endorsed "Medical Appointment," to George Macdonald, Clerk to the Guardians, Poor Law Offices, New Bridge Street, Manchester, by July 31st.

WALSALL AND DISTRICT HOSPITAL.—Resident House Surgeon; doubly qualified. Salary, £150 per annum, with board, lodging, and washing. Applications to Mr. E. J. Brookes, Chairman, Leicester Street, Walsall, by July 27th.

MEDICAL APPOINTMENTS.

AGGERS, H. J., M.B., C.M., appointed Resident Surgeon to the Edinburgh Royal Maternity and Simpson Hospital.

BURDELL, Albert E., M.D. Lond., M.B., Ch.B., B.Sc. Vict., appointed Resident Medical Officer to the Manchester Royal Infirmary, *vice* E. M. Brockbank, M.D. Vict., resigned.

CRUICK, J. Halliday, M.D., F.R.C.P., F.R.C.S. Edin., appointed Physician to the Edinburgh Royal Maternity and Simpson Hospital.

DOUGLASS, William, L.R.C.S., L.R.C.P., appointed Medical Officer of Health for the Chillingham District of the Kingsbridge Union, *vice* G. Heston, L.R.C.P. Lond., M.R.C.S. Eng., resigned.

DRANE, Alex. Thomson, M.B. U.L., L.R.C.S.I., reappointed Medical Officer for the No. 4 (Deplford) District of the Greenock Union.

EDWARDS, A. Spencer, M.B., C.M. Edin., appointed Junior Resident Physician to Smedley's Hydropathic Establishment, and Physician to Smedley Memorial Hospital, Mallock.

GOODING, Angelo, L.R.C.P., M.R.C.S., appointed House Surgeon to the London Hospital.

HONNORS, Herbert, M.D. Lond., appointed Resident Medical Officer to the Hospital for Consumption and Diseases of the Chest, Brompton, S.W., *vice* H. T. Baines, M.D., resigned.

KERR, Arthur, M.D. Abord., F.R.C.S. Eng., appointed Senior Demonstrator of Anatomy at the London Hospital Medical School.

MACKINTOSH, Dr. Arthur Ross, appointed House Surgeon to the Northern Infirmary, Inverness, *vice* G. A. Williamson, M.B., C.M., resigned.

MILLER, James I. B., M.D. Edin., D.P.H., reappointed Medical Officer of Health to the London Urban District Council.

MACLENNAN, Felix Prior, M.B., C.M. Abord., appointed Medical Officer for the Parish of Assynt and the Quoad Sacra Parish of Inverness, N.B.

MEIRHAD, Claud, M.D., F.R.C.P. Edin., appointed Consulting Physician to the Chalmers Hospital, Edinburgh, *vice* D. J. Jenkinson, M.D. Edin., deceased.

NEVITT, Alfred J., L.R.C.P., L.R.C.S. Edin., appointed Junior Assistant House Surgeon to the Stockport Infirmary.

RUSSELL, J. L., M.B., C.M. Edin., appointed Medical Officer for the Cornholme District of the Todmorden Union.

STUART, John Erskine, L.R.C.S., L.R.C.P., appointed Medical Officer of Health for the Borough of Salford, *vice* A. Swann, M.D. Brux., M.R.C.S. Eng.

TAYLOR, W. Macrae, M.B., C.M., appointed Resident Surgeon to the Edinburgh Royal Maternity and Simpson Hospital.

DIARY FOR NEXT WEEK.

TUESDAY.

BRITISH MEDICAL ASSOCIATION.—Annual meeting. For full programme, see pp. 235-247.

THE CLINICAL MUSEUM, 211, Great Portland Street.—Open at 2 P.M., Lecture at 4.

SOCIETY OF MEDICAL PHOTOGRAPHERS, 20, Hanover Square, 4 P.M.—General meeting. Inaugural Address by the President, Dr. W. K. Gowers.

PRESENTATION OF TESTIMONIAL TO SIR JOSEPH LISTER by Sir John Eric Erichsen, at King's College Hospital, W.C., 4 P.M.

BRITISH ORTHOPEDIC SOCIETY, National Orthopaedic Hospital, 234, Great Portland Street, W., 4 P.M.—Cases and specimens, etc., by Mr. Newbolt, Mr. Jackson Clarke, Mr. Robert Jones, Mr. Noble Smith, Mr. Luke Freer, Mr. N. Gratian, and Messrs. Muirhead Little and Keeley. Mr. Tubby, On Original Investigations on the Union of Tendons and its Practical Bearings. Discussion on: "The Treatment of Abscess in Pott's Disease. All visitors are welcome.

WEDNESDAY.

BRITISH MEDICAL ASSOCIATION.—Annual meeting. For full programme, see pp. 235-247.

THURSDAY.

BRITISH MEDICAL ASSOCIATION.—Annual meeting. For full programme, see pp. 235-247.

FRIDAY.

BRITISH MEDICAL ASSOCIATION.—Annual meeting. For full programme see pp. 235-247.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 2s. 6d., which sum should be forwarded in post office order or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

BIRTHS.

FERGUSON.—On July 26th, at 25, Woodland Road, New Southgate, N., the wife of R. Bruce Ferguson, M.A., M.D. Cantab., etc., of a daughter.

TRAVERS-SMITH.—On July 21st, at Trevoze, Beckenham Road, S.E., the wife of V. E. Travers-Smith, M.D., of a daughter.

MARRIAGES.

JONES—MARSH.—On July 17th, at Bangor Isceod Church, by the Ven. Archdeacon Howell, assisted by the Rev. J. L. James, M.A., S. Edwards Jones, L.R.C.P. Edin., I.R.C. Law, etc., son of Mr. Henry Jones, formerly of Leeward, Medd, to Miss, only daughter of Captain G. M. Marsh, late 2nd B. W. F. of Parkhill, Wrexham, and granddaughter of the Rev. G. A. E. Marsh, M.A., formerly Minister of St. Mary's Chapel, Grosvenor Square, London.

FRANLEY—DOMMETT.—On July 16th, at St. Paul's Church, Upper Norwood, by the Rev. W. H. Graham, assisted by the Rev. C. W. Pringle, cousin of the bridegroom, Henry John Pringle, L.R.C.P. Lond., M.R.O.S. Eng., of Tudor House, Anerley, only son of the late John Peard Pringle, of Hestonbury, Wiltshire, to Clara Dommett, youngest daughter of Charles William Dommett, of Hestonbury, Anerley. No cards. At home September 9th, 10th, 11th, and 12th, 2 to 6 P.M.

SMITH—FISHER.—On July 23rd, at Christ Church, Brondesbury, by the Rev. W. Snape Cadman, Vicar of St. Andrews, Peckham, assisted by the Rev. C. Dale Williams, Rector of the Parish, Ernest Newlyn Smith, M.D. Lond., M.R.C.S., of Forth Lodge, Willesdon Green, to Charlotte, eldest daughter of Henry Fisher, Esq., of Carrick, Willesdon Lane.

DEATH.

JACOBSON.—On July 17th, at Sleaford, Thomas Edmund Jacobson, M.R.C.S., L.R.C.P., L.S.A., aged 66 years.

LETTERS, NOTES, AND ANSWERS TO CORRESPONDENTS.

COMMUNICATIONS FOR THE CURRENT WEEK'S JOURNAL SHOULD REACH THE OFFICE NOT LATER THAN MIDDAY POST ON WEDNESDAY. TELEGRAMS CAN BE RECEIVED ON THE SATURDAY MORNING.

COMMUNICATIONS RESPECTING EDITORIAL MATTERS SHOULD BE ADDRESSED TO THE EDITOR, 429, Strand, W.C., London; those concerning business matters, non-delivery of the JOURNAL, etc., should be addressed to the Manager, at the Office, 429, Strand, W.C., London.

AUTHORS DESIRING REPRINTS OF THEIR ARTICLES PUBLISHED IN THE BRITISH MEDICAL JOURNAL ARE REQUESTED TO COMMUNICATE BEFOREHAND WITH THE MANAGER, 429, Strand, W.C.

CORRESPONDENTS WHO WISH NOTICE TO BE TAKEN OF THEIR COMMUNICATIONS SHOULD ACCOMPANY THEM WITH THEIR NAMES—OF COURSE NOT NECESSARILY FOR PUBLICATION.

CORRESPONDENTS NOT ANSWERED ARE REQUESTED TO LOOK TO THE NOTICES TO CORRESPONDENTS OF THE FOLLOWING WEEK.

MANUSCRIPTS FURNISHED TO THE OFFICE OF THIS JOURNAL CANNOT UNDER ANY CIRCUMSTANCES BE RETURNED.

IN ORDER TO AVOID DELAY, IT IS PARTICULARLY REQUESTED THAT ALL LETTERS ON THE EDITORIAL BUSINESS OF THE JOURNAL BE ADDRESSED TO THE EDITOR AT THE OFFICE OF THE JOURNAL, AND NOT TO HIS PRIVATE HOUSE.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, on forwarding their Annual and other Reports, favour us with duplicate copies.

Queries, answers, and communications relating to subjects to which special departments of the BRITISH MEDICAL JOURNAL are devoted will be found under their respective headings.

QUERIES.

MEDICUS wishes to hear of an effectual method of getting rid of brown house ants, which follow the course of hot water pipes.

Q.S. asks for the names of a few towns in South Africa, large enough to have established banks, suitable for the permanent residence of a young man recovering from phthisis?

DR. LANK (Hereford) would be obliged if any member could tell him of a home for a dumb child whose parents could only afford to pay a small amount.

MEMBER asks: What are the best works of reference on the etiology, treatment, and morbid anatomy of goitre, for the purpose of writing a thesis on that subject?

INFANT FOODS.

MEMBER asks: What is the exact percentage composition of both Mellin's and Benger's Infant Food?

* Mellin's food consists almost entirely of dextrin with some glucose and soluble starch. In Benger's farinaceous food the flour is partially dextrinised by dry cooking and impregnated with an extract of pancreas. We know of no published analysis of the composition of these foods.

A WARNING.

CHIROURGEON writes: Allow me to warn your readers against an American who professes to be a nephew of Professor Sayre, of New York, and endeavours to borrow money as a temporary loan.

* Such an individual called at the office of the BRITISH MEDICAL JOURNAL on July 22nd, and attempted to borrow half a sovereign to pay for a telegram to New York. He stated that he had a letter of introduction, but had forgotten it. He left rather hurriedly, and promised to return with the letter, but has not yet done so.

ANSWERS.

K.—The question is too general to admit of reply. Our correspondent might consult *Medical Practitioner, Pharmacy, and Apothecary*, by W. Barnard, M.A., F.R.S., and G. B. Stocker. London: Stevens and Sons, 1895. 10s. 6d.

HOMES FOR INEBRIATES.

GALT.—There is no "model" refuge in England. We are unable to recommend any individual person or institution. Perhaps our advertising columns may furnish the information.

ELECTROLYSIS OF SUPERFLUOUS HAIRS.

DR. GRO. STEINLE FRANKING (Wimpole Street, W.) thinks that in the electrolysis of superfluous hairs a galvanometer should be used. To destroy hair follicles about 2 to 2.5 milliamperes are required. The number of cells requisite to obtain this amount is less in a recently charged battery.

"AN ALTERNATIVE TO CONFESSION."

DR. J. MORRIS EVANS (Llandrindod Wells, Wales) has written to suggest to the correspondent whose inquiry was published in the BRITISH MEDICAL JOURNAL of July 20th to try the waters and muds and muds of Llandrindod Wells. The waters contain salts of calcium, sodium, and magnesium, and are valuable for gout, etc. The situation is elevated to be least and the air is dry, bracing, and pure—an excellent restoration after pollution. He will be pleased to supply further information and to be of any service.

TREATMENT OF CHRONIC CONSTIPATION.

DR. G. D. M. RICHES, M.D. (Birmingham) writes: Let "Paterfamilias" try the following combination: Ammonium chloride 10 grains, the same quantity of sodium chloride, 10 grains; water 1 ounce, given at bedtime for three or four nights. My patient cannot take pills or tablets, or I should have preferred a more complete and friction in food or tablet. I had heard that Dr. Williams' had cured a patient of constipation in London, but it is not amongst their remedies.

NOTES, LETTERS, Etc.

DIETARY AT IPSOON COLLEGE.

PATERFAMILIAS writes: A few years ago I saw some correspondence in the BRITISH MEDICAL JOURNAL upon the dietary of Ipsoon College, and I should like to know on reliable or competent authority if the matters then complained of have been rectified, or if there was ground for such complaint.

The education given at the College is universally agreed to be excellent, and it would be very interesting to many parents to know if the dietary is equally satisfactory, especially as "school-boys' dietary" has lately been under discussion.

* The following paragraph appears in the annual report of Ipsoon College for 1894: "In consequence of correspondence regarding the dietary of the College, which appeared in one of the leading medical journals, an exhaustive inquiry into the matter was held by the Treasurer, the Chairman of the Finance Committee, and a member of School Committee, and the result of their inquiries was afterwards laid before the School Committee for their consideration. The report of this Committee, with some suggestions on minor points, was received and adopted by a special meeting of the Council, and was of a very satisfactory nature. A copy was sent to the parents and guardians of all the boys in the College and to the leading medical journals. The Council wish it to be distinctly understood that the authorities of the College are at all times willing to listen to any suggestions for the benefit of the pupils, and they sincerely hope that parents will more frequently come and see how their sons are cared for. If this is impossible, written and signed communications will always receive courteous attention. With regard to beer, it is given in all public houses. The beverage provided at the College is good and wholesome, only about 40 per cent. of the boys drink it, and it is thought advisable not to withdraw it compulsorily, but to leave the question to the discretion of parents, whose directions in this matter will be strictly obeyed."

THE DISCUSSION ON MIDWIVES AT THE EDINBURGH OBSTETRICAL SOCIETY: A CORRECTION.

DR. NORMAN WALKER (Edinburgh) writes: Allow me to correct the report of my remarks at the Edinburgh Obstetrical Society. As reported they are liable to misconception. I refer to the remarks on midwives receiving a percentage of the fee from the doctors they call in. I said that I knew this occurred in Germany, and only a few days previously had been informed that it was not unknown in England. Your reporter makes me say that it "still" existed in England, as if it had at one time been rampant there. There is a tendency to take one up so sharply on this particular subject, that I desire to make my correction as soon as possible.

HANDBILLS AND PRIVATE DISPENSARIES.

A. T. B. sends us a handbill setting out the "new economic system" of a "Private Dispensary," at Leeds. It is a flagrant instance of medical advertising, of which there have been too many examples of late. That it is most derogatory to the profession will be generally admitted, and it is much to be regretted that the various licensing bodies do not make stronger efforts to prevent their licensees from issuing such advertisements.

We would suggest that copies of this handbill should be sent to the Royal Colleges of Surgeons and Physicians of London.

THE ETIOLOGY OF APPENDICITIS.

DR. J. ERNEST FRANKS (Vernior) writes: The question of heredity in appendicitis raised by Dr. Armstrong Atkinson in the BRITISH MEDICAL JOURNAL of June 20th, p. 1429, is an important one in the etiology of the disease; here the heredity lies in the tendency to the development of the predisposing condition—uricæmia (or uricæmia, or uricæmia) (see Dyce Duckworth). When there is an excess of uric acid or urates in solution in the circulating blood, it is a necessary consequence that deposition, when it occurs, should be in excess, and this excessive deposit is more likely than a smaller one to produce excessive symptoms referred to the seat of excessive deposition. In acute rheumatism or gout the joints are the seats of this deposit, but it should be remembered that urate deposits occur in other persons than those of an "articular diathesis," as we term it for want of more definite knowledge, when it occurs in these others it has other than articular symptoms. The cases given by Dr. Atkinson seem to belong to this "uricæmic" group. If we follow Dr. Atkinson as I have done in this communication, and accept uricæmia as standing in a causal relationship to and accompanying diathesis mellitus we can explain the repeated attacks of appendicitis in the father as due to repeated deposition; this might follow a slight uricæmic attack or the use of such drugs as iodides, morphine, opium, or, in fact, as other factors that tend to lessen the solubility of urates and deposit them in the tissues. I am inclined to believe, I believe, that Dr. Atkinson's case and the case of the mother are related to the condition mentioned. To put the question shortly, I believe, with Dr. Atkinson, that gout and rheumatism are the same essential cause. Necessary tendency to these three affections generally means an inherited gout or uricæmic diathesis, or uricæmia, and it is found especially in relation with gout, rheumatism, and psoriasis; psoriasis is accompanied by many signs of uricæmia. The pathological history on the mother's side is in-

interesting and raising the question of pathology in regard to the three conditions mentioned. In all three cases the question of the existence of the disease is taken, but the question of the fact that they were "without any serious pathology" is left to the reader to decide. As regards the medical patients, are, according to my experience at the Victoria General Hospital, the three conditions mentioned. While there is an antagonism in the same individual between the tuberculous and arthritic diathesis, there is a close connection when in the same family. It is not, however, in the relations between the tuberculous and arthritic diathesis, which I have tried to show is the inherited tendency in Dr. Armstrong Atkinson's cases.

THE COST OF AN EPIDEMIC.

DR. T. ARMSTRONG ATKINSON writes in an editorial in the *BRITISH MEDICAL JOURNAL* of July 13th it is stated that by adding up (1) the loss of wages, (2) the estimated costs of treating and (3) burying the victims, and (4) the capitalised value of the producing power of those who died from an epidemic of enteric fever, Dr. Campbell Munro calculated that it cost the community of York-shire a pecuniary loss equal to £21,497, and yet only to the same subject again in the *JOURNAL* of July 20th.

Will you allow me to point out that in his zeal for a good cause the medical officer of health has fallen into the error of overestimating the loss to the community. I presume everyone will admit that an actual pecuniary loss to that extent would be much more impoverishing to that community than the burden of the epidemic was in fact. The error I take to be the assumption that the work of those who fall sick or die is lost forever, and is lost to the community. Whereas in all ordinary circumstances someone else takes his place or does his work. If no work is left undone the community loses nothing from that cause. When a worker falls ill and one of the unemployed takes his place the community only suffers the cost of keeping him idle for the lost of keeping the unemployed idle. Hence it is not fair to count the sick man's loss of wages nor his loss of ability to work as so much loss to the community. What is his loss may be another's gain.

When a man consumes as much as he reproduces his death is no pecuniary loss to the community. It is well known how rapidly and completely a nation recovers from the loss of men due to a great war or pestilence. Hence I submit it is wrong in calculating the cost of an epidemic to count the capitalised value of the producing power of those who die unless we subtract the value of what they may be expected to use up, waste, and destroy.

The human sense of the average citizen tells him that the pecuniary cost of an epidemic is summed up in the expenses actually incident to that calamity, and in ordinary circumstances his common sense is about right.

A CURIOUS PHENOMENON.

MR. GEO. H. BATE, Marine Surgeon, Queen Adelaide's Infirmary, Bathurst, writes: A young woman recently brought alive here for "bad breath," as she termed it. On examination it appeared that she had been suffering from acute inflammation ending in abscess. She complained of "bad breath," which she was to apply ointment; thus the woman had actually been doing what I saw her. The above treatment is applied in every town in country districts to ladies with sore throats, etc., but it is the first time probably that readers of the *BRITISH MEDICAL JOURNAL* have heard of it being applied to abscess of the breast.

PRIZE ESSAY ON HYGIENE.

THE French Société de Médecine Publique et d'Hygiène Professionnelle, owing to the generosity of an anonymous donor, offers prizes for the best memoir on Preventive Measures, the Preventive Measures to be Taken. The first prize is 200 francs, the second 100 and the third 50. The essay is not to exceed from twenty to thirty pages in text. The following points must be treated: How to prevent contagious diseases during the illness and after; private sanitation of patients and those who tend and treat them; house sanitation and disinfection; and general sanitation during illness.

LETTERS, COMMUNICATIONS, Etc., have been received from:

(A) Dr. C. Allan, Elgin; A.D. Amicus. (B) Dr. J. W. Ballantyne, Edinburgh; Messrs. C. Blundell and Co., London; A. H. Benson, M.B., Dublin; Dr. A. E. Brindley, Eccles; Mr. G. Bradford, Birmingham; Mr. F. E. Bennett, London; Mr. T. C. Bailey, Crews; Dr. G. B. Beale, Bournemouth; Sir W. H. Broadbent, London; Dr. R. Boxall, London; Dr. R. E. Barges, Chester; P. Bosbyer, M.B., Nottingham; Mrs. Boulnois, Liverpool; Mr. W. Brown, Carlisle; W. H. Blake, M.B., Harpenden; Dr. James Barr, Liverpool; Dr. J. B. Brierley, Old Trafford; Mrs. A. E. Ballin, London; B. SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

Eight lines and under	20	4	0
Each additional line	0	0	6
A whole column	1	17	6
A page	5	5	0

An average line contains six words.

Advertisements should be delivered, addressed to the Manager, at the Office, not later than noon on the Wednesday preceding publication; and if not paid for at the time, should be accompanied by a reference.

Post-Office Orders should be made payable to the British Medical Association at the General Post-Office, London. Small amounts may be paid in postage-stamps.

N.B.—It is against the rules of the Post Office to receive letters at *Postes* addresses addressed either in initials or numbers.

PRESIDENT'S ADDRESS,

DELIVERED AT THE

SIXTY-THIRD ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION.

BY

SIR J. RUSSELL REYNOLDS, BART.,

M.D., F.R.C.P., F.R.S.,

President of the Royal College of Physicians.

THE POWER OF LIFE IN LIFE.

TWENTY-TWO years ago the British Medical Association held its annual meeting in London, and last year the members of the Metropolitan Counties Branch thought there were then abundant reasons why the Association should be invited to assemble here again, and the whole meeting of the Society convened in Bristol cordially accepted the invitation.

THE MEETING IN LONDON IN 1873.

The Association was presided over in 1873 by the late Sir William Fergusson, the most distinguished surgeon of that day; there must be hundreds here who remember him well: his grand physique, his skilful and, indeed, artistic performances; the absolute ease with which he bore himself under the most trying circumstances of unavoidable accidents and yet not unforeseen, of events which no human knowledge could forecast, and of difficulties which needed all his resources of hand and courage to encounter.

SIR WILLIAM FERGUSSON.

Yet, gentlemen, I venture to say that if, like a well known but not quite historic character, Sir William Fergusson could have fallen asleep about that time, and have not waked up again until now, and were capable of appearing amongst us again, absolutely unconscious of the kind of progress made in surgery during those two-and-twenty years, and of the steps by which such progress was carried to its successful ends, even that dauntless surgeon might pause to perform an operation, which either of his dressers of twenty years ago might be announced to do to-day, and would do without fear or dread.

"Experience is by industry achieved and perfected by the swift course of time." Such industry has been unsparing, I may also say relentless, not in consideration of the patient but of the worker. It has come from all sources of scientific investigation that could be focussed in the operating theatre, and it has done more than the surgeon of my student days—and Robert Liston was daring enough—could have foreseen even in his most optimistic dreams.

DR. E. A. PARKES.

The Address in Medicine was delivered in 1873 by the late Edmund Alexander Parkes, and all of us who remember him, and all who have become acquainted with his writings, know how vast was his range of information, how keen his foresight, how subtle and yet how true his faculty as a critic; but still, if Parkes could, even after only the few years since his untimely death, revisit Netley, or his still older haunt, University College, even he would be entirely bewildered and amazed if he found his house-physician feeding a patient on smothered steaks, or injecting thyroid extract for the cure of myxodema.

SCIENTIFIC MEDICINE IN LONDON.

In physiology, in pathology, and in medicine advances, equally important to each, have been made during the past two-and-twenty years. It is not my intention to occupy your time with any details on these matters, but let me recall, for a moment, your attention to the vast strides that have been made in the elucidation of both structure and function—such, for example, as in the researches upon the thyroid, the adrenal bodies, the spleen, and the liver; the advance of bacteriology; the function of the axis-cylinder of nerves; and the magnificent prospect before us of a new field of therapeutics in the serum-treatment of disease.

Physiologists, pathologists, and therapeutists have "seen visions" and in the past have "dreamed dreams"—as we may be dreaming now—but the facts, now well before us have certainly astonished even the expectant, have surpassed their imaginations, and opened before them, not one only, but many doors into regions crowded to the full with yet more fruitful information, waiting only to be arranged and utilised.

So much of the work that has led to this present state of science has been accomplished in the metropolis that, although we know what has been done and is still being done in the provinces, we thought it well to ask you to meet us here, tell us of your own work, and join with us in a mutual endeavour to gather more and more by combined work and earnest, honest rivalry for truth than we could do by disunited efforts. What my object in this address is mainly concerned with is to draw your attention to that which seems to me to be the most striking fact of modern physiological, pathological, and therapeutical research, namely, the power of "living" things for both good and evil—namely, in the conservation of health and in the prevention or cure of disease. The mineral and inorganic world has helped us much, but now our help and hope come mainly from organised products and still living agencies.

During the last twenty years there has been established, to the great advantage of our profession, the "Conjoint Examination" by the Royal Colleges of Physicians and Surgeons. This, while not interfering with the autonomy of either College, has raised the plane of education required of all who are candidates for entrance into the profession, and has so brought into combined action the Colleges themselves, that they have added, each to the other, authority and dignity in the recommendations they have made from time to time with regard to matters of education, Parliamentary proceedings, State medicine, and scientific research.

But the building on the Thames Embankment, which will be well seen during the next few days, is very much more than an Examination Hall: it is the centre of a very hive of industrious work. You will see there the most recondite and obscure processes of Nature under the most elaborate scrutiny and faithful record. The delicate phenomena and suggestions of "living" and "chemic" functions are under minute survey, analysis, and detail. The points where they touch, the mode in which facts of either may be rendered in terms of the other; their bearings upon the life of animals and men, both as individuals and as parts of a community; the diagnosis of the most obscure diseases, and the tentative and more than tentative endeavours to counteract poisons which can be separated but not destroyed, over-ruled but not abolished. These, and much more, you will see under the skilful and careful guidance of the able director of the laboratory, who, with his many coadjutors, will gladly welcome all those who are interested in such minute research.

This is one of the products of the last twenty years, but it does not stand alone: the Brown Institute, the Society for the Promotion of Knowledge by Research, the British Institute of Preventive Medicine, the laboratory of University College, and of the other large schools, are all doing similar work, and constitute the most promising features of the present day with regard to advance in the science and art of medicine.

THE IMPROVEMENT IN TEACHING.

In all our schools you will, I am sure, find very great improvement in the mode and scope of teaching; and this especially in its being less didactic and more practical. Much of the old-fashioned, often dreary, "lecture" of an hour's duration has passed away, and in its place is a "demonstration," an "object-lesson," a conversation, or examination. These are more useful and therefore more attractive to the students; and, at the same time, more trying, but none the less efficiently rendered by the teachers.

Again, in clinical teaching you will observe much more and closer personal relationships, not only between the physician and the student, but between the student and the patient. The latter is not a mere "dummy" in a bed, exhibited as a specimen of this disease or that, but a "human being" to be spoken to and to help you—I mean the student—to find out whether or no the card at the head of his bed,

on which the diagnosis of his malady is supposed to be written, is correct, or as full as it might be.

Then there is another point which has struck me much during the past ten years, and especially so whenever demonstrations are being given, either at the bedside or in the laboratory, namely, the far greater interest and earnestness which characterise the student of to-day as compared with his predecessor. Much of this, I think, due to the indulgence of a larger hope. Hidden, as still are, the great mysteries of life, there yet are definite facts to be grasped by the mind, to be seen and handled, not only imagined or asserted; and the place of these facts in the economy of Nature, their bearing upon others, and their relation to work yet to follow, give a precision and confidence to study that is, comparatively speaking, of modern growth. There was plenty of assertion and show of knowledge in the past; but even the teachers did not believe the half of what they taught, nor comprehend the half of their sage pronouncements. Nature has, as it were, taken man more into her confidence, and daily reveals so much, even while concealing more, that the learner stands firmly on the ground he has gained, instead of trombling on a quagmire, the length, and breadth, and depth of which he could not see and did not care much to imagine or investigate. He felt sure of little then but of his own and his teacher's ignorance, but now he grasps much that is ascertained truth and such as can be seen, shown, measured, and recorded with perfect accuracy.

METROPOLITAN MUSEUMS.

Our metropolitan museums in Bloomsbury, South Kensington and Lincoln's Inn Fields will afford to all museum lovers an ample reward for careful examination. Two of them were splendid examples, twenty years ago, of what could be done to make "collections of material" instinct with information, and object lessons of physiological and anatomical lore; but the marvellous accumulations that have reached us during the period I have mentioned are, I think, only exceeded in marvel by the industry, high thought, and consummate skill with which these materials have been arranged, and made to tell, in their own way, the story of their being, and of their place in the great Kosmos of which they form a part.

THE WORK OF THE SECTIONS.

The *JOURNAL* of the Association informs us that the work of this meeting will be carried on by fifteen Sections, fully equipped with their respective officers, and each presenting subjects for discussion to be brought forward and threshed out by able hands. But let me remind you that these Sections, or at least many of them, have had now, for varying numbers of years, their counterparts in the metropolitan and provincial Branches and societies, where discussions are taking place all the year round, records of which are constantly published in magazines, proceedings, and other appropriate journals. In this manner the increase of medical literature has become enormous, and as a rule its value is very high. Of course it would be too much to suppose that, coming from so many sources and from such differently constituted minds, its merit should always be equal, or of the highest order. It cannot be expected of all who write and all who speak that one should say, as was well said of one of our late distinguished members, "he spoke because he had something to say, not because he wanted to say something." In the business of these societies it is the bringing together of recent facts or ideas, and the friction of mind with mind that is so useful, in separating the real and substantial from the imaginary or accidental; and in this work all our large towns and even country districts are assisting; and the marvel is that when we meet, even as we do now and here in the metropolis, there should be such a tremendous store of material to be brought before us for discussion or reception. For example, in the Section of Medicine alone, there are three subjects for discussion, and on these fifty members have already expressed their wish to speak; there are, moreover, thirty papers promised, and it is to be expected that few of these will pass without any variety of opinion on their merits being entertained and expressed. It is not to be imagined that all that is advanced will be either new or true, but of this we may be sure—that nothing will be brought forward without duly

careful consideration, and apart from the belief that it is worthy of the time and the attention which those who are present will be asked to bestow. I am induced to make these remarks by the fact that the number of members of the Association is now three times as great as it was when we last met in London, and it is one of the most important events of the last twenty years that such an organisation should have grown into being, and should have such a vast influence for good over the whole civilised world.

LOOSE PHRASEOLOGY AND EPONYMOUS TERMS.

There are some points in our present state of scientific precision in which, to my mind, it would appear we have made but little advance. We know much more about diseases, their origin, their anatomy, pathology, interrelations, modes of ending, and their treatment; but with regard to nosology and nomenclature there is little of which we have to be proud. Groups of symptoms have been described by different observers as marking some tolerably distinct departures from recognised types of malady, and, for want of any nosological position being assigned to them, they are called after their first describers' names, and so we have not only Bright's disease, Addison's, and Graves's, but a host of others, often indeterminate in character, going by the name of Friedrich Raynaud, Hodgkin, and others, until there is a fair prospect of every distinguished pathologist or clinical investigator being handed down to posterity as a disease, the name of which conveys no semblance of a meaning as to its nature. Still further and more to be deplored, there are smaller groups of symptoms which are not honoured by receiving the names of their describers as separate diseases, but the names of the observers are tied on to the symptoms; and so Cheyne-Stokes breathing, Corrigan's pulse, von Graefe's sign, somebody else's phenomenon, and a multitude of other like phrases are used, to the great confusion of the student, and not only so, but to his real and permanent injury. For what is easier to say than that there is "Cheyne-Stokes breathing," except to feel a sense of rest in having made use of that learned phrase, and so practically to shut the door to further inquiry as to what it means and how it comes about, what its diagnostic or prognostic value may be, and how it bears on therapeutics? When quite a boy I was watching the dying bed of my maternal grandfather, aged 84, who had been afflicted with right hemiplegia and aphasia a few days previously. Of all medical terms I was absolutely ignorant, but that variety of breathing struck me much—as it was likely to do—and after observing several long pauses, I exclaimed to the nurse when he had not breathed for over a hundred seconds, "Surely he is gone now!" To my surprise, the practised old observer replied, as she looked up from her knitting, "Oh, lor', no, Sir; they never goes that way!" So far as my own experience teaches me she was right; but I have not yet met with a satisfactory and thoroughly scientific explanation of Cheyne-Stokes breathing, nor of its prognostic value.

Of course to give the proper name to a disease is to place it where it should be, nosologically, "at home," and understood; but medicine is not a science yet sufficiently "ordinated" for this thing to be done. We can, as yet, "predict" with certainty but little, and so we grope about, and "gather dust and chaff," with little chance or hope of turning them to value; and instead of making this the matter of most serious investigation, and finding the true relation between the new "group of symptoms" and those others which form the central facts, the backbone, and whole skeleton of pathology, we lay hold of the first piece of red tape ready to our hand, tie up the group of symptoms in a bundle, and label it Brown, Jones, or Robinson's disease!

A suggestion was made, not long ago, by one of our most able and energetic thinkers, that some apparently new diseases might perhaps with advantage be named, provisionally, after the patients who exhibited them. This certainly had the merit of originality, as it struck me at the time I heard it, but in looking at my casebooks I found that already I had several times adopted it in so far as to say "Case XYZ resembling, in particular features, that of A B C," or some other very familiar patient. But nothing could be worse for scientific medicine than any such retrograde proceeding. If there be any danger of nomenclature resolv-

ing itself into a catalogue of the names of distinguished pathologists, as has been suggested, it would be a still more terrible disaster if a differentiation should be carried still further on this dual system of nomenclature, and that the student should have to be examined in his knowledge of the "George Brown variety of Robinson's disease," or the "Max Schott's deviation from van Hopper's sign."

At the very time that there is this increasing use of loose phraseology, there is also—as is common enough in other departments of life—a marked tendency in the opposite direction, and that is to connote as diseases certain groups of symptoms by some short, or long, and often not very appropriate word or words, such as aeromegaly, hypertrophic pulmonary osteo-arthritis, appendicitis, pseudo-hypertrophic muscular paralysis, and others. There is abundant precedent for this; some are time honoured and old enough to be allowed to live, such as pertussis, epilepsy, apoplexy, chorea, gout, and rheumatism, which have the merits of brevity and of meaning; but there have crept into ordinary conversation nowadays a number of expressions which add us little or, as I think, not at all; and such words as gastro-jejunostomy and laparotomy do little more than lay us open to the satires of the playwrights of the last century in foreign countries, and its predecessors in our own.

ORGANIC MEDICATION.

But whatever may be our failures—and they are small compared with our enormous successes—there is nothing that has happened during the past twenty years to be compared in importance, as I have already said, with the new revelations that have been made of the potency and pre-potency of life—the power of life in life—in health, in disease, and in its treatment. I allude of course to the interpretation of much of the functions of certain organs, the existence of which had been known for many years, but the utility of which had been absolutely unknown, for example, the pituitary body, the thyroid gland, the suprarenal capsules, and others.

The knowledge of the functions of the liver and the spleen has been gradually increasing for a long time, and only by slow degrees have the metabolic properties of these organs taken the place of the older ideas of secretion of bile and balance of weight. It has been, on the other hand, although the outcome of serious investigation, but also somewhat by a fortuitous concurrence of thoughts and events, that the most astounding revelations of modern physiology have been made. What we have come to know amounts to this in general terms—that the absence of certain organs, of the functions of which, until quite recently, we knew nothing definite, leads to grave and diverse diseases of the body, whether this absence be brought about by surgical operation, or by disease more or less individual or specific in its character; and that, such being the case, the supply of the material of that organ as food, or some part of it, as an extract, to be introduced into the blood, removes the symptoms, acts with great promptitude, and, I might say, almost with some violence of disturbance of the whole economy. Not only so, but these extracts seem to possess a power reaching far beyond that which was first found to be their almost anticipated result—that is, in so modifying the action of the heart and the intravascular pressure, in a manner and to a degree entirely unlooked for, and requiring much further investigation, in order to unravel the true nature of the functions of these organs in health, and the value they may have, by their products, on the processes and treatment of disease. As yet we are only on the threshold of still greater discoveries in regard to life, but we see, through the portal, ranges of facts which are trustworthy guides as well as sign posts, and which will, we believe, lead us to a larger knowledge of those second-order processes of life in its most essential and characteristic features—namely, of the nutrition of all organs, of the way in which this is brought about, and of the interdependence of all tissues, so that perhaps, in a far higher sense than we have ever realized before, the truth may be revealed that "when one member suffers all the members suffer with it," and the reason of this may be explained.

A very obvious consideration which should "give us pause" in self-congratulation is this, that as in past days the functions of different parts of organs, the kidneys, for

example, were more or less clearly separated by physiologists, no longer with us now; so we have seen recently, that only certain portions of other organs have the physiological effects just discovered, and thus that there may be in what we have regarded as much simpler organic components even in quite simple tissues, some unconsidered element of function, some *sine qua non* of healthy life, some missing link in the phenomena of disease, so that it behoves us to keep the mental eyes wide open, to clear away all films of prejudice or hasty complacency, to expect the unexpected, and so, without looking for it, to find our reward.

MICROBIOLOGY.

Not less important than the matter I have just referred to is the recent development in "microbiology" and "all that therein is." The "germ theory" of disease is not new. When it commenced, and who has the credit of its begetting, I do not know. Probably, like ancient and modern heroes, it had many parents, and as many homesteads. It is quite clear that our own great Harveyan entertained it, as may be seen by the following:

"Let physicians cease to wonder (he says) at the manner in which epidemic, contagious, and pestilential diseases scatter their seeds and are propagated to a distance through the air, or by some 'fomes' producing diseases like themselves in bodies of a different nature, and in a hidden fashion silently multiplying themselves by a kind of generation until they become so fatal, and, with the permission of the Deity, spread destruction far and wide among man and beast; since they will find far greater wonders than these taking place daily in the generation of animals."

Years later it was a hobby ridden by many but without much convincing proof. But even so late as 1890 we find that advanced pathologist Dr. Edmund Alexander Parks saying, with regard to the etiology of influenza, "We find ourselves in the presence of the so-called 'fungus theory of influenza,' and after discussing this matter at length, 'it seems impossible at present to come to any conclusion as to the nature of the cause.'"

THE BENEVOLENT MICROBE.

The most important fact with regard to recent microbiological research is the gradually-increasing appreciation of the fact that these lower forms of life exert, not necessarily mischievous, but, indeed, benignant influences on the human body, and that although the more of their operation is not fully explained they take part in healthy processes, assisting normal functions, nay, indeed, it would seem sometimes producing them and warding off the malign effects of other influences to which we are habitually exposed. These bodies, to which we are indebted for this aid, operate partly by their chemio action and partly by what we must call a vital process, and by their cultivation outside the human body and their modification by passing through other organisms, can be made to exert a malign or a beneficial agency on man. It seems even in the range of possibility that at some time not very distant some other than "the ancient mariner" may apply to them the far-reaching words of Coleridge, and exclaim:

O happy living things! no tongue
Their beauty might declare;
Sure my kind saint took pity on me
And I blessed them unknowing.

The third great revelation of the last twenty years is the wonderful protective and curative power of these living products. This, in a very wide sense, is not new. Of all the most powerful agents of destruction, the most violent have been derived from "living" things; they are to be found in the animal and vegetable worlds, not in the mineral. In their most terrible malignity—such as in snake-bite, glanders, or hydrophobia—these need no human skill for their development; they are prepared in the laboratory of Nature, and, now, are only too ready to our hand. Next to these come the poisons of stinging things, and after them the more slowly operating and less deadly animal poisons; some with indeed beneficial influence, as "vacina" comes with local effects on the skin, but not often great disturbance of the general health.

The vegetable kingdom can produce potent poisons, such as belladonna berries, aconite root and leaves, poppy juice,

and the Ignatian bean; but in order to render these more deadly the hand of man has to come in and prepare nicotine, strychnine, morphine, and the like; just as it may produce, from the mineral or quasi-mineral world, such potent agents as hydrocyanic acid, concentrated acids, and other dealers of destruction.

The interest in these facts lies in the modern mode for their utilisation. The great potency of living products has led to very fanciful notions in therapeutics; and there have been those who, to cure diseases of organs, have given portions of the same but healthy organs of animals or of man or other animals. Again, the idea has been pronounced that even excreta were useful drugs, and that the diseased organs of man might effect a cure of those supposed to be afflicted in like manner.

IMMUNISATION BY SERUM.

Curious as some of these details are, they are of real interest to us only as they lead up, through inoculation for small-pox, to our own Edward Jenner's discovery of vaccination, and then, through the researches of Pasteur, Lister, and Brown-Séquard, to our present state and plane of knowledge. It would seem now that there is scarcely any limit to what may be expected in the cure or prevention of disease; and the most striking of all phenomena is, to my mind, the probability of rendering an animal immune by the introduction into its organism of a healthy constituent of the body of another. This, if fully confirmed, will be the greatest veritable triumph of therapeutic and preventive medicine, instituted and guided by extended inquiry into comparative anatomy, physiology, and pathology. As in the human race or species there exist, as is well known, what may be termed "idiosyncrasies"—by which is simply meant that as a matter of fact some people, and some people's families, escape epidemic diseases, whereas they are especially prone to take others to which they may be exposed—so in the great economy of Nature certain groups of animals have been shown to exhibit no capacity for "taking," or for even being "inoculated" with the poisons to which others are exposed, and from which they suffer, and that severely. It would seem, therefore, that use may be made of these animals, more or less naturally immune from certain maladies, and that their immunity may be partially conferred on man.

Quite recently a communication of the greatest importance has been made on the rendering of animals immune against the venom of the cobra and other snakes, and on the antidotal properties of blood serum of immunised animals. This subject has occupied attention during the last six years, and we must all look forward with expectancy and hope to the possible and probable diminution of a great national and imperial calamity.

LIFE THE PROTECTOR OF MAN.

The outcome of all that I have been saying is this: that the scattered fragments of knowledge and "guesses at truth" of many years have been gathered into a focus during the past twenty-five years; that the vegetable life, extracting from the mineral world the materials it needs for growth and production of powerful agencies for good in the form of food and medicines, and for evil in the form of poisons, has given itself up to the growth of animal life, with its much more complex organs, and for cure of its once thought beyond the reach of human aid; but that, thanks to man's scientific ardour and industry, it has again shown itself to be our servant, our helper, and our protector.

These are not dreams of the study, they are facts of the laboratory and of daily life; and in using that word "life" again, I must endeavour to emphasise still more forcibly upon you my urgent belief that it is to living agencies and their employment that we must look for help in the care of infancy, the conduct of education—moral, mental, and physical—the training up of character as well as of limbs; that it is the guidance of living functions, in the choice of living occupations, be they either of hard work or of amusement. It is to these we must appeal if we would see the *mens sana in corpore sano*; and then it will be to these that we may confidently look for help when the inroads of age or of disease are at hand, often to cure us of our trouble; or, if not, to give us rest and peace.

It would be absurd in me, now and here, to attempt to say

in what this potency of life exists. It is enough for us to recognise its existence, rejoice in its marvellous energy, and anticipate still more from our investigations of its modes of action, but I cannot help feeling that, however far we go in our research into the arcana of Nature, one of our ablest neurologists, who has gone very far, is right when he says: "Search while you may with eyes, however aided and however earnest, that which we call 'life,' eludes our search and resists our efforts. We must be content with what knowledge we can gain, secure or insecure, and while using it as best we may, should realise in all humility how much there is we cannot know, and yet we cannot doubt."

THE LIFE OF THE PROFESSIONAL BODY.

There are three aspects of life to which I wish to make further reference, because it seems to me very important that this Association should, at some of its annual meetings, direct special attention to their consideration. And first, a few words on "professional" life. As physicians and surgeons, however numerous, we do not constitute a "body" of men unless we have some one prevailing spirit, common to us all. The profession may include its thousands and tens of thousands, but it is a crowd, a multitude, or shall I say a "mob," unless there is in it an *esprit de corps*; and, thanks to our great seats of learning, our universities and colleges, we have developed this uniting spirit, now for many years. But our own special colleges of physicians and surgeons, our medical societies, and especially this vast Association, have done more within the last fifty years to give real, unifying life to its individual members than was possible, or even expected to be possible, by our forefathers.

THE BRITISH MEDICAL ASSOCIATION AND THE BRITISH MEDICAL JOURNAL.

There are sixty Branch associations in direct communication with our colossal trunk, spreading themselves not only over the United Kingdom, but to the remotest parts of our dominions; and these are all equipped with efficient officers, holding meetings all over the world, discussing the really important topics of the day, and adding their contributions to the sum of knowledge through the pages of our quite remarkable JOURNAL. Now, this is very encouraging and very hopeful; but it entails, as it is bound to do, great responsibilities. That so large a body of men should be banded together under one common name means that they have some common purpose, and some common plan of co-operation to attain it.

What that purpose is we know, namely, to render our profession of the highest service, not only to the individual but to the State, by taking our share and giving our advice in the making of our laws, so far as they affect us, as members of our profession; by the regulation of our charities; the guidance and control of labour; the care of the pauper and the pauper child; the lunatic and the quasi-lunatic, or the habitual drunkard; by the care of our poorer brethren; by the advance of scientific researches, and especially of those that require combined efforts and combined funds for their prosecution; by the promotion of useful and stable literature; and by the elevation of all that constitutes the education of the man of science, the physician, the surgeon, or the guardian of the public health.

These noble purposes cannot be achieved, nor have any of them been carried to any useful extent, without self-sacrifice, as well as the sacrifice of time; without a consideration of the views of others as well as an assertion of one's own; without respectful regard to the feelings and positions of our colleagues, as well as a due estimation of those which we may occupy; without patience as well as work; and an all-pervading sense of hope, in the midst of trying times, and in the darkest hours. One thing, in addition, we should all most strenuously try to do, and that is to avoid waste of time. We may use it, or sacrifice it freely, but we cannot afford to throw away one moment; whether it be on personal ends, forlorn hopes, foregone conclusions, or threshed out heaps of seedless faggots.

It is in this spirit, I am sure, that we begin our vast meeting in the metropolis, and if we but continue along the lines of conduct our Association dictates, and if in the control of the affairs of our daily life we always bear in mind

our belonging to a noble profession, and to a great Association of fellow workers for its benefit, and for the benefit of mankind at large, we may hope to see that—useful as it may be now—at some future assembly of our fellows, it will not be found necessary to constitute a special section for the discussion of those questions which fall under the category of ethics.

Outside our professional life, but closely mixed with our daily work is the "social" constitution or, as some would call it, the "environment" in which we have "to live and move and have our being." Certainly it has changed much within the last twenty years, and it would be impossible for me to dissect it now, and say in what ways we have advanced, and in what others we have either retrograded or gone far, far, out of the beaten track. The changes are on all hands, are pressing, importunate, and I might say overbearing. They are not seen in the assemblies of such reverend bodies as the Royal Society, the Colleges of Physicians or Surgeons, or in the higher courts of our universities; but may be met with in the courts of law, the park, the theatre, the concert room, the school, the public assembly, the drawing room, and last, and worst of all, in the home.

SENSATIONALISM AND DECADENCE.

It would seem as if "reverence, that angel of the world," had from some regions taken flight, and that in her place were idols, or mocking shadows, or gorgeously apparelled lay figures. This absence of reverence shows itself everywhere, but perhaps it is possible to classify even such a negative quality and put its leading features under three great categories: (a) reverence for all that constitutes the religious element in life; (b) for that which is the groundwork of "social" propriety, and I may say even of decency, as our predecessors would have thought; and (c) for the constituted order of relative dignity in "family" life. Thus, much that now passes for wit, humour, cleverness, or fine and advanced thought may easily be resolved into offences either against the religious sense of others, that is, trespasses in the direction of profanity; or against the long-recognised standards of propriety, in topics of conversation, in literature and art; or sins in many directions against the widest meaning of the old commandment "Honour thy father and thy mother." If all shade of profanity, impropriety, or rudeness were eliminated from what now passes current in books, in plays, and in conversation we should, I think, often find little or no humour left, but only a vapid attempt at seeming cleverness, or at best some silly pun. Even the epigrammatic style of writing and talking at which there is so much attempt, especially in the conversations detailed in the modern novel, has generally lost all real point and excellence; and in most instances has degenerated into clumsy efforts to be smart and unintelligible or to gild the refined gold of the setting of that priceless gem of humour, when natural and spontaneous, the true "Irish bull." The sparkle of the humor is lost, there is a semblance of a paradox, and wrapped up in this an obvious and often intentional untruth. If this were rare we could let it alone, least of all could we think it worthy of notice in the meeting of this Association; but it is not rare. Our literature is positively flooded with this senseless and misleading nonsense; even science is sometimes dragged into its degrading service, and the profession of medicine has not escaped its touch.

If we ask ourselves, "What is the meaning of this and whence its origin?" I do not think we shall have very far to travel. Of late years there has been imported into our country a phrase which, in my humble opinion, is abominable in itself and in its power for evil. I will not quote it, but let me ask you if you do not think that this idea of the approximation of the "end of the nineteenth century," with the nonsense that has passed into its literature, has not had much to do with it? It may be that the notion has arisen in some minds that when its "crack of doom" has come, and they wake into a new epoch, foibles will be left behind, no more records will have to be made or broken, wild oats will be trampled under foot, and no more will be sown; that there will be an end to the frivolous talk of the last decade, that a "new earth" will be here for us to tread, and that if there be any idea of a heaven lurking in such minds, there will be a "new heaven" also. It has seemed to me that something like these notions have passed current in many circles, and have

been held to excuse what would otherwise be not only inexcusable but intolerable.

Now, gentlemen, it is against all this absolutely unscientific and unphilosophical verbiage that, I think, we, as members of the profession of medicine, should utter our strongest protest. Nature does not progress by leaps; the terms, limits, and boundaries of time are convenient arrangements we have made for ourselves; to pass them may make or destroy some legal powers or exemptions from responsibility; but they have, in themselves, nothing whatever to do with the essentials of our individual and domestic life. When the last stroke of the bell has knelled, in the midnight of London, the last hour of 1899, do we really think that either here, or there, or anywhere, it will carry with it any substantial meaning, or any wholesome lesson? I cannot for a moment believe it will. Old and young people will die, in the awakening as in the dying year; babes will be born in the one century and in the next; there will be bridal feasts and funeral marches; wisdom and folly; sickening accidents and more sickening crimes; there will be "new women" and "new men"; but there will also be "old women," and those of both sexes, and "old men" to tell us of the far better days when they were young and everyone was wise!

As physicians and surgeons we can, I think, do much to counteract this, as it seems to me, growing tendency of the present day. In the nursery, in the schoolroom, and yet a little later, we would give advice, and that of useful sort. Little girls and little boys may strip themselves as high as may be, and paddle on the sands of the salt-sea shore with relative impunity, for they rarely venture into water over ankle deep; but, when a few more years have passed, and, exposed as society now sanctions, they roam on another shore of that "Ocean of Time whose waves are years, treacherous in calm, and terrible in storm," they may be overtaken by the tide they have courted, and to them "Life be never the same again."

There is still the one great and greatest relationship of life to which I will address myself, but only for a brief period—I mean the conduct of our profession to the "religious" element in our nature. Here, we have nothing whatever to do with creeds, be they hoary with age or flushed with the bloom of youth; all that I mean is that we, members of the medical profession, have to deal with those to whom these creeds mean much, and are, with what they entail to many, the be-all and end-all of existence. I am not thinking for a moment of the few substitutes proposed for religious faith, but referring only to that which relates those who entertain it to the Higher Power, the source of Revelation and of good and hope, far other than is to be found in themselves or in Humanity, be it in its Future or its Past. I am sure that in giving the help we hope and ought to give to suffering and sorrowing man, we shall do nothing worthy of the name unless we realise, and that to the full, the importance of this factor in our lives and theirs; and so guide its operation as to help it to chasten, subdue, control and comfort those to whom it is the minister that they feel to be sent from God, to help them in their passage through this region of passing shadows to that of realities which are abiding things.

Acting in this spirit in our professional life, and in our relation to the social and religious lives of our friends and patients, we may, I think, take courage, and, entertaining a larger hope from holding a larger view of life, adopt the words of the Laureate of the first half of this century, and exclaim:

"Look forth, my soul!
(Nor in this vision be thou slow to trust)
The living waters, loss and loss by guilt
Stained and polluted, brightness as they roll,
Till they have reached the eternal day, burst
For the perfected spirits of the just!"

FIRTH COLLEGE, SHEFFIELD.—Considerable progress has been made recently towards carrying into effect the project for affiliating Firth College, Sheffield, with Victoria University. A sum of £20,000 will be required to carry the scheme through. The existing endowment of the College is £23,000; the Town Trustees of Sheffield have now voted a sum of £10,000, Sir Henry Stephenson has made a conditional promise of £5,000, and a public appeal will be made for the remaining £12,000.

ADDRESS IN MEDICINE

BY

SIR WILLIAM BROADBENT, BART.,

M.D., F.R.C.P.,

Foyal Isen to Ordinary to H.R.H. the Prince of Wales.

At the Annual Meeting of the British Medical Association at London, July-August, 1895.

THE GROWTH OF THE ART AND SCIENCE OF MEDICINE.

THE heavy responsibility of delivering the Address in Medicine on the occasion of the visit of the British Medical Association to London has been placed upon me by the Council of the Association. The opportunity of addressing so many of his colleagues as are assembled here rarely happens to a medical man. The honour attending it is very great, and nothing short of his best thought and endeavour ought to satisfy his sense of what is due to the occasion. It was under the influence of this feeling that I entered upon the difficult task of deciding what I should bring before you to-day, and it seemed to me that it was better that I should resist the temptation to take up some special subject, or a topic of local or temporary interest, and once more go back to the past and see what lessons it has for us at the present day. I propose, therefore, to consider the growth of the art and science of medicine.

THE ART AND SCIENCE OF MEDICINE.

I place the words "art" and "science" in this order advisedly, for the art of healing is one of the primary needs of social organisation, however rudimentary, and preceded by many ages the development of anything which could be called a science of medicine. So far, moreover, the art of healing has always been in advance of science, firmer in its basis and more secure in its principles, and, even when medicine as a science has realized our highest aspirations, the end and aim will be art, that is, skill in the recognition and treatment of disease. At the same time it is true that until science began to throw light on its path the art of healing struggled blindly on its way, and its advances were intermittent and slow, with long intervals in which there was stagnation and retrogression. All true progress in medicine has consisted in the application of the results of scientific investigation to the facts of observation.¹

MEDICINE BEFORE HIPPOCRATES.

At whatever period of the world's history and at whatever stage of civilisation we may contemplate the physician engaged in combating disease, there will be recognisable three distinct factors in his work—his power of identifying disease, the remedies at his command, and the ideas by which he is guided in the employment of these remedies.

The first rough and imperfect identification of the more common forms of disease was scarcely worthy of the name of

diagnosis. Anatomy, which is essential to the localisation of morbid conditions, was scarcely known; no shadow of comprehension of physiological or pathological processes entered into the conception—it was simply the attaching of a name to an assemblage of symptoms, the course of which, however, was watched with great sagacity.

How remedies were first discovered and how the properties and uses of so many of them as were handed down from remote antiquity were known is matter for amazement. Animals are credited with instincts which direct them to the consumption of certain herbs or mineral substances when their health is deranged; the instincts of the primitive man also must have applied to remedies as well as to food, and experience of their effects must have been accumulated and transmitted, embodied frequently in legend or superstition, as part of tribal knowledge.

Of the infancy of medicine properly speaking we know nothing. Individual acts of healing are related in the Old Testament, and the treatment of wounds is described by Homer; the Chinese from remote antiquity had a system of medicine, and medicine has a place in the *Vedas*; but in the works of Hippocrates, the earliest medical literature which has come down to us, we are at once introduced to the theory and practice of the art of healing at a considerably advanced stage of development. Already there were rival schools of thought and treatment, and disease was discussed with extraordinary acumen from opposite points of view both as regarded its nature and phenomena.

Bleeding was in everyday use, not by any means as a routine fashion, but with judgment; cupping also was practised. The virtues of opium were known, and purgatives of various kinds, chiefly irritating and violent, and emetics were familiar remedies; enemata and suppositories and pessaries were employed, and fomentations and poultices in great variety were applied.

HIPPOCRATES: THE SUBORDINATION OF THEORY TO OBSERVATION.

Hippocrates, whose writings embody all our knowledge of ancient medicine, was born about 460 B.C. He was a contemporary of Socrates, Euripides, and Aristophanes, and was a worthy representative of medicine at that brilliant period of Greek literature and intellect called the age of Pericles.

It is true that his knowledge of anatomy was rudimentary, and that his physiological ideas were totally wrong, but he has left of himself the picture of a sagacious observer and wise physician. He was the inheritor of the knowledge and traditions of the school of Cos, and another source of information by which he had profited was the training establishments of athletes, where the influence of diet, gymnastics, and baths on health and vigour was carefully watched. His attitude of mind was towards the study of disease as such, rather than the differentiation of distinct diseases. Refinement in this latter direction had obviously been carried much too far by the school of Cnidos, which he criticised and opposed, where symptoms were looked upon as separate morbid entities.

His distinguishing merit, however, was that he was guided by observation and not by theory. Hippocrates could not, any more than his contemporaries or successors, or than we ourselves, escape the dominion of theory, but his theories were generalisations from observed facts, and not deductions from preconceived ideas or so-called first principles.

The doctrine with which his name is associated, that of the action of humours and of critical days, for example, is essentially a generalisation from the natural history of certain simple diseases. In coryza or bronchial catarrh there is a watery acid running from the nose, or scanty viscid expectoration with obvious constitutional disturbance. A change in the character of the secretion is attended with a remission in the symptoms, and after the discharge of more or less mucopurulent matter there is a return to normal conditions. Something of a like kind is observed in the urine in fever and in the stools in diarrhoea. For the accomplishment of these changes a certain time is required, which, when ascertained in each class of disease by careful observation, gives the critical day. The facts were essentially facts of the natural history of disease. The theory evolved as an explanation of the course of events and applied in the elucidation

¹ In my first sketch of this address I was tempted to use that comfortable word "evolution," but I found this term appropriated on every side, and employed to connote such a variety of modes of progress that my poor effort would have been lost in the crowd. Besides, a very little reflection showed me that for such progress as "progress" from the general to the special, which is what is really implied by the term evolution, can be traced in the history of medicine, but that, as Mr. Hallour says:—"Assuming, as we do, that knowledge exists, we can hardly do otherwise than make the further assumption that it has grown, and must yet further grow. In what manner, then, has that growth been accomplished? What are the external signs of its successive stages, the marks of its gradual evolution? One at least must strike all who have survived, even with a careless eye, the course of human speculation: I mean the recurring processes by which the explanations or explanatory formulae, in terms of which mankind endeavours to comprehend the universe are formed, are shattered, and then in new shape are formed again. It is not, as we sometimes represent it, by the steady addition of tier to tier that the fabric of knowledge upriseth from its foundations. It is not by mere accumulation of material, nor even by a plant-like development, that our beliefs grow less inadequate to the truths which they strive to represent. Rather are we like one who is perpetually engaged in altering some ancient dwelling in order to satisfy new-born needs. The ground plan of it is being perpetually modified. We build here, we pull down there. One part is kept to repair, another part is suffered to decay; and even those portions of the structure which may in themselves appear to be quite unchanged, stand in such new relations to the rest, and are put to such different uses, that they would scarcely be recognised by their original design."

tion of disease of which the processes were not patent on the surface, was that some one of the four humours, the due balance of which constituted health, had obtained predominance and set up disturbance, general or local; this was concocted or elaborated by the animal heat, increased for the purpose, and qualified by admixture of other humours, and so brought into a condition in which it could be expelled and got rid of.

Hippocrates, from this subordination of theory to observation, from his careful study of the causation of disease not less than from the lofty sentiments and clear judgments contained in his writings, remains, and must ever remain, the model physician.

During the 500 years which separated Galen from Hippocrates the centre of gravity of the civilised world had shifted. Greece, shattered by conflict between its different States, had succumbed to Macedonia. Alexander had conquered Asia and then died. On the ruins of his empire Rome had gradually risen, and when Galen lived had extended her rule over Greece, Asia Minor, Egypt, and the southern littoral of the Mediterranean as well as over Gaul, Spain, and Britain. There had been time, however, for the development of a high degree of intellectual activity and literary culture under the Ptolemies in Egypt, and Alexandria had become a great centre of learning. Here marked advances were made in anatomy, dissection was practised on human bodies as well as on animals. Herophilus, between 305 and 280 B.C., left his name to the confluence of the sinuses of the dura mater; Erasistratus, a contemporary, recognised in a crude way the motor and sensory functions of the nerves; Chrysermes, 240 B.C., wrote on the pulse, as does also Heraclides, 230 B.C.

Medical writings date from Alexandria as late as 170 A.D., but the school had long lost its authority, and Rome henceforth attracts the highest medical talent. The physicians who first made a name in Rome are Greeks—Asclepiades, the friend of Cicero, and Galen himself. Celsus, however, who comes between the two, writes in Latin.

THE REIGN OF GALEN.

Galen, who was born at Pergamus A.D. 130, as is known to all of you, dominated medical thought for 1,500 years, and if it was inevitable that authority should exercise such undisputed sway for so long a period it was perhaps fortunate that it derived from Galen. He was in spirit a follower of Hippocrates, and the basis of his ideas on disease and its treatment was observation. His keen and active intellect and fertile imagination, it is true, led him to theorise on every conceivable subject; but the impression left as to his character by reading his numerous works is that of an acute observer, of remarkable ingenuity and profound judgment, and excellent common sense.

He dissected diligently and thoroughly, but mainly monkeys rather than the human subject. Taking this into consideration, his writings on anatomy were wonderfully complete and exact. They held away till the time of Vesalius. He finds the most ingenious reasons, often far-fetched and preposterous, for the form, consistence, and relations of all the various organs.

In respect of anatomy, his knowledge was incomparably superior to that of Hippocrates. He experimented on the spinal cord and on the nerves, and knew that they subserved motion and sensation—knew even that there were motor and sensory nerves distributed to the muscles and skin respectively, discovered the part taken by the recurrent laryngeal nerve in phonation, and, although his physiology is chiefly represented by fanciful teleological explanations of the uses of the different parts and organs, he made noteworthy additions to the knowledge of functions.

Apparently Galen was the first to establish the fact that the kidneys secrete the urine, and that it was conveyed by the ureters to the bladder. At any rate, this was disputed in his time, the objection being that the urine could not be forced back through the ureters, and could not, therefore, have entered by these canals. The bladder was supposed to attract the urine. He demonstrated it by tying the ureters; and in the course of his experiment he almost stumbled on the discovery of the circulation, for he maintains that blood is carried by the renal arteries to the kidneys in order that its watery part may be filtered off. The traditional ideas as to

the origin of the veins and of the flux and reflux of the blood in them, however, blinded him to this and other evidence, and he believed that the arteries contained air, though he maintained that they also contained blood.

A frequent reproach brought against Galen is that he spoke of the interventricular septum as perforated, so as to allow the passage of air between the two ventricles, against the evidence of his senses; but an excuse can be found for him in the fact that invisible communications had always been supposed to exist between the trachea and the arteries by which air passed from one to the other. He can only have meant similar invisible perforations, the orifices of which he would think he saw in the depressions which the walls of the ventricles present.

To convey even the faintest idea of the additions which Galen made to medical knowledge would require more than all the time at my disposal for this address. He wrote more than a hundred treatises on various subjects, including six on the pulse, and, while giving extravagant descriptions and making fanciful comparisons, he pointed out distinctions and characters which have been verified by the sphygmograph.

His treatise on local affections is remarkably true to Nature, and no more impressive lesson on the value of observation, even when unaided by science and experiment, can be afforded than by realising how fresh and vivid and modern his descriptions of diseases and symptoms sound. His diagnosis, for example, between hæmatemesis and hæmoptysis and other forms and causes of blood spitting leaves little to be desired.

I cannot deny myself the pleasure of quoting a passage which illustrates his robust common sense. He is distinguishing between the different causes of ischuria:

"Suppose the patient to be a child who has previously presented symptoms of stone, watery urine charged with sandy deposits, the child continually squeezing the penis, which is flaccid or unaccountably erect; then sudden stoppage of urine takes place. It may be reasonably concluded that the stone is lodged in the neck of the bladder. Place the child on his back, the hips a good deal raised above the rest of the body; then shake him in different ways so as to make the stone fall out of the canal. After these proceedings, tell the child to try and pass his water. If the attempt is successful and the urine flows you will be satisfied that you possess the exact diagnosis of the cause, and that at the same time you have found the proper treatment. Should the retention persist, you will shake him again still more forcibly; if after this it still persists, then with the catheter you will push the stone from the neck of the bladder to reopen a passage for the urine." It might be my surgical colleague, Mr. Jonathan Hutchinson, who was speaking.

POLYPHARMACY.

Materia medica was always too multifarious, even in the earliest times, and that of Celsus and Galen was much more varied than that of Hippocrates. Theriaca, so named from containing viper's flesh, was the subject of a work by Galen. It was a complicated opiate electuary containing about 63 ingredients, among which besides poppy juice and the vipers, were pepper, rose leaves, iris, liquorice, cinnamon, nardus, cassia, crocus, frankincense, balsam, gum, fennel, cardamome. It is said to have been employed for 2,000 years. Aloe, in Galen's hands, had largely taken the place of the irritating purgatives, such as hellebore and spurge, previously employed. Dioscorides, who wrote in the first or second century, describes more than 2,000 substances, chiefly vegetable. It may be remembered, by some now present, that an attempt was made only last year to invalidate the patent for lanoline, on the strength of a process for obtaining fatty matter from wool, given by Dioscorides.

The doctrine specially associated with the name of Galen is the humoral pathology accepted by him from Hippocrates and developed. The humours are phlegm, blood, yellow bile, and black bile; and all diseases arise either from a change in the quality of these humours, or from a predominance of one or other of them, or a flux of some particular humour to a given part. But, like Hippocrates, Galen is first of all an observer and his theories, faulty as they may be, are generalisations from observations and not deductions from *a priori* assumptions as to the nature of things.

Both Hippocrates and Galen rejected the doctrine of the sect of empirics, who declared that experience alone, without reasoning as to the nature or relations of observed phenomena, and without reference to causation, or to the influence of climate, season, age, sex, character of constitution, or mode of life, was the only safe guide in the treatment of disease.

Hippocrates still more emphatically rejected the pseudo-philosophical deduction of rules of treatment from the abstract qualities, hot and cold, dry and moist, acrid and sweet; and Galen in his turn rebutted the methodic doctrine of Aesclepiades and Themison, which he found prevailing in Rome, according to which all diseases were referred to constriction and relaxation and treatment consisted in relaxing and astringing.

A high standard of medical literature is maintained by Oribasius, the friend of Julian, 350 to 400, by Aetius, who wrote near the end of the fifth century; Alexander, a little later in the reign of Justinian; and Paulus, who lived about 620; and improvements in practice can be traced during this period.

Alexander treated gout by purgatives, in which a kind of colchicum was a constituent. Paulus first described the aperient action of rhubarb, and extolled steel in scirrhus of the spleen.

After this there is a long gap in the history of medicine and of the liberal arts generally, but this is not to be wondered at. The Roman system of civilisation was gradually broken up, and its warring fragments were shaped by geographical and racial conditions into States out of which modern Europe has grown.

The seat of Government was shifted from Rome to Constantinople in 330. Rome was sacked in 546 and 549; later the Church established its dominion over the ruins of the ancient city.

As countries and governments were organised and delivered from the pressure of constant war, universities were founded. At Salerno there were already professors of physic in the middle of the seventh century. Charlemagne founded a college here in 802, and the Schola Salernitana was dedicated to Duke Robert of Normandy, son of William the Conqueror. The Universities of Bologna and Paris almost rival in antiquity that of Salerno. Thus in these dark ages the revival of learning and the renaissance of art were being prepared.

THE ARAB PHYSICIANS.

Names which have remained famous began again to appear in the ninth century. The followers of Mohamed in the course of their conquests found at Alexandria the works of Hippocrates, Galen, and other early medical writers. These they translated into Arabic, and upon them was based the medical learning for which Arabian physicians became renowned. With the Moorish conquest of Spain, and the extraordinary culture and civilisation developed by the invaders, the writings of Hippocrates, Galen, and the best Greek physicians, which had almost been lost sight of, came back to Europe with practical additions and modifications of great interest. Venesection was employed with greater moderation, and milder purgatives were substituted for hellebore and the like.

Rhazes, 852 to 922 A.D., besides reproducing the most important works of Hippocrates and Galen, gave the first account of small-pox, which, like the plague and cholera, came to us from the East, where he had seen it before the Saracens brought it into Europe in the course of their invasion. His description of this disease served for 500 years, and it is perhaps worthy of remark that he compares it to a ferment in the blood, like must. He is said to have been the first to employ chemical as distinguished from Galenical remedies.

Avenzoar speaks of adherent pericardium and mediastinal abscess, and employed nutrient enemata. Albucasis appears to have been very enterprising as a surgeon. It was only at the end of the fifteenth century that, in the general revival of learning, Greek medical literature displaced the Arabian writers, and again resumed its authority.

While there is evidence that clinical medicine was seriously cultivated, such events as the visitation of the plague in 1348, which carried off one-fourth of the population of

Europe, and modified profoundly social history, or the successive epidemics of the sweating sickness, which specially affected this country from 1485 to 1529, left no mark on the history of therapeutics. Syphilis, which first became prevalent and virulent in 1494, afforded better opportunities for the trial of remedies. Guaiacum obtained a reputation as a specific for this disease, which we do not now understand; but it was seen before long that mercury, which was employed in the form of inunction, was the real remedy. John of Vigo was the first to recommend mercurial inunction, but Cargus previously employed it as secret remedy, and amassed a large fortune thereby. Fumigations were also practised. The effects were attributed to the carrying off of humour by the salivation which was produced. The introduction of mercury was an important addition to the materia medica.

THE RENAISSANCE.

Already in the fourteenth century *post-mortem* examinations and dissections of the human body were made. The imagination was stimulated and a material impulse was given to the energies and ambitions by the discovery of America in the fifteenth century, and the invention of printing in 1462 made general intellectual culture possible. An evidence of the revival of interest in medicine was that the practice of medicine, which had drifted into the hands of monks and priests, was reclaimed. Linares in this country took the licensing to practise out of the hands of the bishops, and founded the Royal College of Physicians in 1518.

The prodigious mental activity of the sixteenth century took in medical matters the form of eager and close study of human anatomy. Vesalius challenged the accuracy of Galen, and was haled before the Inquisition for his pains. Other names which mark this epoch and which have been left imprinted on some part of the human frame are Fabricius, Eastachius, Fallopius, Ingrassius, Columbus, Arantius, Varolius, while Servetus, Columbus, and Cesalpinus almost penetrated the secret of the circulation. This great discovery, however, was reserved for our own Harvey, and the publication of the *De Motu Cordis* in 1628 constituted the most important epoch in the history of medical, and indeed of biological, science. But while vindicating his undoubted claims we must not forget that he owed his early knowledge of the anatomy of the heart and vessels to Fabricius, and drew his inspiration from the teaching he found at Padua. There is no need for me to dwell on the importance of the discovery of the circulation. When completed by the demonstration of the capillaries by Malpighi and by the discovery of the lacteals already made by Aselli in 1622, and of the receptaculum chyli and thoracic duct by Pecquet in 1647, and of the lymphatics by Steno somewhat later, the foundation was laid for physiology and the first step taken towards a real comprehension of disease.

THE SLOW SPREAD OF THE DOCTRINE OF THE CIRCULATION.

It was a long time, however, before the establishment of the circulation began to bear fruit. Indirectly, it is true, an end was made of various absurd discussions, as, for example, whether bleeding ought to be done on the same side as a pleurisy or on the opposite side, which was the subject of a formal enunciation by the University of Salamanca to be enforced by legal penalties, and minds were emancipated from the authority which had enslaved them for so many centuries. But the first conclusions drawn from the circulation of the blood and lymph were absurd if not mischievous; one kind of blood was supposed to be conveyed to the muscles, another to glands, and the nerves were supposed to convey nutriment to white fibrous tissue, and it will be remembered that a century after Harvey there were physicians who sat to Le Sage for the portrait of Sangrado, which he drew in *Gil Blas*, and to Moliere for the character of Diafoirus.

SYDENHAM.

If we take Sydenham, who wrote between 1666 and 1680, and Boerhaave (1668-1738), the best and most representative physicians of their respective times, we find that while they have fully realised the fact of the circulation of the blood it had exercised remarkably little influence on the theoretical views which they entertained with regard to disease, or on their practice.

Sydenham may be called the English Hippocrates. He was the last and best of the pure Hippocratic school, unless, indeed, we include Trousseau. He was above all a careful clinical observer. If time had permitted it would have been interesting to compare his knowledge of disease, the remedies he employed, and the theories he entertained as to the causation, nature, and treatment of disease with those of Hippocrates and Galen, on the one hand, and with those of the present day on the other. With regard to remedies the great acquisition of Sydenham's time was bark, which had been brought over from America by Jesuit missionaries about the middle of the seventeenth century. After accepting it cautiously, he employed it freely but judiciously, laying down rules which have been found useful ever since. Mercury was of course in common use, and antimony was an acquisition of which he thought highly. Epidemics he attributed to influences emanating from the earth, and he considered that different years and the various seasons impressed different characters upon the prevalent diseases, in which, in fact, he followed Hippocrates. Other diseases were due to vitiation of the blood; Nature was engaged in the expulsion of the peccant substances. It was the business of the physician to co-operate with Nature, and his art consisted in recognising the indications presented by the symptoms and the direction in which he must act in order to aid in restoring the normal equilibrium. "As for the physician," he says, "all his philosophy consists in following the history of diseases and in knowing how to employ the remedies which experience has shown to be the most efficacious for their cure, and at the same time he ought to follow a method which is founded, not on chimerical speculations, but on a common and natural way of reasoning."

Again: "They deceive themselves grossly who imagine that the principal defect of medicine is that it lacks powerful and efficacious remedies which chemistry alone can furnish. On the contrary, what is most wanting to medicine is not to know the means of fulfilling such and such an indication, but to know precisely what the indication is which has to be met. The smallest apothecary's apprentice will tell me in five minutes the drugs I must employ to vomit or purge, to sweat or cool a patient: instead of which, to learn with equal certainty when and in what case I ought to employ such and such a remedy in different diseases requires one to be extremely well versed in the practice of medicine."

Boerhaave, whose principal works date from the first years of the eighteenth century, was also a great physician, and exercised by his writings and through his enthusiastic follower and commentator, van Swieten, a powerful and lasting influence on medical thought in his day. He evidently had great experience, and was successful in practice. He had the great merit, too, of teaching at the bedside. He seems to have thought that with the discovery of the circulation and the advances in botany, chemistry, physics, mechanics, and clinical experience, medicine had in his day attained to certainty and almost perfection, but his theories were drawn largely from the assumptions and imaginations of the iatro-mechanical school.

IATRO-CHEMICAL, MATHEMATICAL, AND MECHANICAL THEORIES.

Nothing could more confirm us in our respect for the genius of Hippocrates and the good sense of Galen than to attempt to follow the fanciful extravagances which from time to time partially displaced their humoral pathology, and have been known as the iatro-chemical and iatro-mathematical or mechanical theories. Every discovery in alchemy, as early attempts at chemistry were called, and every new development of mathematical or mechanical science, was in turn seized upon as affording the clue to the causation and treatment of disease. Even the circulation of the blood and the early knowledge of structural anatomy were turned to perverse theoretical use. Just as for the methodics in the time of Galen every disease was referred to constriction or relaxation of parts, and the remedy sought in relaxants or stimulants, so at one time all diseases were ascribed to acidity or alkalinity of the humours or to fermentations; or again to obstruction of pores or minute vessels and inspissation of liquids. The contraction of muscles was due to a sudden swelling of their substance set up by the nervous

juice or spirits conveyed by the nerves. Respiration was for the purpose of giving a due comminution to the blood by the movements of the lungs. Fever was explained by an acrid nervous juice, which excited the heart to more frequent and forcible action.

THE GROWTH OF A SCIENCE OF PHYSIOLOGY.

Later still the physiological discoveries of Haller, the establishment of the principle of irritability as a property of living tissues, and the employment of the term "stimulus" led to another general theory of disease—the doctrine that fever and inflammation were the result of over-stimulation, which was attended by a return to extravagant and indiscriminate bleeding. From this there was the Brownian reaction to the contra-stimulant doctrine, with equally indiscriminate, if not equally mischievous, administration of stimulants. Even the revelations of morbid anatomy and pathology were at first made the basis of a general doctrine relating to disease—the organismism of Broussais; everything was referred to gastro-intestinal inflammation, and again venescence was the universal remedy.

From this time the character of the work which I have seen before myself changes. Up to the present we have only been able to register accretions of knowledge and follow interpretations more or less close to the truth which were advanced in the absence of science. We have now reached a point at which we are entitled to say that ultimately science is to be our guide. Therapeutics will be scientific in proportion as the operation of remedies is referred to physiological laws. Physiology, in turn, is scientific in proportion as vital actions and processes are referred to physical and chemical laws. What remains for us to do is to follow the rapidly converging lines by which this consummation is being approached.

Taking up our parable again at Harvey's great discovery, we find that it remained comparatively barren until it was supplemented by Lavoisier's explanation of the process of respiration, and indeed almost until a further impulse was given to thought and experiment by a diagnosis of diseases of the heart by means of physical signs.

Then an important step was made in the elucidation of the mechanism of the circulation by the discovery of the vaso-motor nerves, and the demonstration of the contraction and dilatation of the arterioles in obedience to stimulation of these nerves, by Claude Bernard.

Almost concurrently the regulatory apparatus of the heart's action through the vagus and sympathetic was identified by the brothers Weber. These discoveries were followed out in detail by a multitude of experimenters and the adjustment of the supply of blood to local demands for the purposes of nutrition, secretion, muscular action, and the response of the heart to the general requirements of the system, to excitement, emotion, exercise, are now thoroughly understood.

It is only comparatively recently that the blood pressure in the arteries and veins, and in different parts of the arterial and venous system, first measured tentatively by Stephen Hales, has been experimentally investigated by the graphic method by Ludwig and his school and made available for clinical work through the sphymograph by Marey and his followers.

The relative share of the heart and vessels in the production of variations in the blood pressure was thus made clear, and then for the first time the complex and multitudinous indications afforded by the pulse could be understood.

At the same time that the lacteals and lymphatics were discovered, the structure of the glands was investigated by Glisson and Wharton, and the minute anatomy of the tissues generally was initiated by Malpighi, Leyden, and Leuwenhoeek, who demonstrated the capillaries by injection and recognised the corpuscular elements of the blood by means of the first rude form of microscope.

The invention of the microscope opened another avenue to knowledge, and every improvement in this instrument led in the preparation of structures for examination has been followed by a further penetration into the secrets of organisation and a better comprehension of function. Staining, for example, has not only facilitated the identification of different structures in their minutest ramifications and in their intricate combinations, but has made it possible to distinguish between active protoplasm, in whatever form it may

be found, and the material formed by it, and has revealed essential differences between cells otherwise apparently alike in all respects.

Schwann and Schleiden laid the foundation of histological science by the discovery of cells as the structural unit, and when the knowledge of minute anatomy had reached a certain point the results were systematised by Bichat, who by his general anatomy prepared the way for the cellular pathology of Virchow.

Side by side with advancing knowledge of structure has come increasing comprehension of function. Physiology from first to last is based on experiment. It was by experiment that Galen proved that the kidneys secreted and the bladder retained the urine, and learnt the motor and sensory functions of nerves, and that Bell, again, nearly 1700 years later, discovered that the posterior nerve roots were sensory and the anterior roots motor. It was, of course, by experiment that the circulation of the blood was established. The advances made by Haller (1757-77), again, in the elucidation of vital action were based on experiment. It was not, however, till the example was set by Majendie that experiment was systematically employed in the investigation of all the functions. He was followed by Claude Bernard, to whom we owe our knowledge of the vasomotor apparatus and its influence on secretion and nutrition, and with whose name is associated the glycogenic function of the liver, which has been lately questioned if not overthrown by Pavlov; by Ludwig, who elucidated the dynamics of the circulation; by Marshall Hall and Brown Sequard, who led the way in the experimental investigation of the functions of the various parts of the nervous system which has now reached such a wonderful stage of development.

Next to the discovery of the circulation, and almost rivalling it in importance, was the elucidation and proof of the theory of respiration. Priestley had shortly before discovered oxygen, and combustion was just beginning to be understood, when the demonstration by Lavoisier, in 1783, that carbonic acid was exhaled and oxygen absorbed by the lungs, and the comparison of the operations which resulted in this interchange of gases with the process of combustion was not merely an increase or development of previous knowledge; it was a revelation and a revolution. Until then the lungs were supposed to be simply the great and primary instrument for giving a due comminution to the blood. For the first time chemistry was brought into relation with vital operations. The original ideas, it is true, were imperfect and in some respects erroneous; but the conception of respiration as comparable with combustion was the germ of all our present knowledge of oxidation as the source of the various forms of energy developed in the system.

The full development of these ideas, however, was only possible when the doctrine of the correlation of forces and the conservation of energy was established, and it is an interesting fact that it was originally suggested by the search for an explanation of the constancy of the temperature of the body in different climates and under varying conditions.

As the microscope has revealed the intimate structure of the tissues and the mode in which they are first developed and then maintained, so chemistry has followed step by step, interpreting the connection between structure and function. The molecular changes which constitute the science of chemistry, indeed, underlie and determine the structural changes revealed by the microscope. Chemistry it is which brings us closest to the ultimate facts of life, and gives us the deepest insight into vital operations. Every vital action is a chemical action, whether the as yet to us mysterious process by which are built up the complex chemical molecules out of which the tissues are constructed or the partially understood catabolic operations by which energy is liberated.

Profound importance attaches, therefore, to the progress of organic chemistry, and those who have prosecuted its study, from Berzelius and Liebig, who led the way by analysing the excretions and secretions and by separating and classifying the organic constituents of the various structures down to the workers of the present day, who by processes of inconceivable delicacy and refinement isolate the toxins and anti-toxins which play so important a part in disease, have ministered to the progress of medicine. Chemistry must

ultimately form the link between physiology, pathology, and therapeutics.

THE BEGINNINGS OF A SCIENCE OF PATHOLOGY.

So far we have been chiefly concerned in following the growth of knowledge relating to healthy structures and normal functions. Facts relating to the effects produced by disease on the different organs could be collected, and the symptoms attending the progress of disease and revealing its nature could be recorded, independently of any comprehension of the processes by which morbid changes were effected. Such accumulation of facts and such observation of symptoms were indeed necessary before study and experimental investigation of morbid processes could be undertaken.

Morgagni (1682-1771) may be called the founder of pathological anatomy. He was the first to describe on a large scale minutely and systematically the appearances found in post-mortem examinations and to connect them with the symptoms observed during life.

John Hunter, who had perhaps a deeper insight into pathological processes, may be placed side by side with Morgagni. Andral and Cruveilhier later produced magnificent treatises and atlases, and since their time an enormous accumulation of facts by pathological societies has taken place, and innumerable works on pathology have systematised the results and marked the progress made. The intent study of the changes produced by disease could not but imply a desire to understand the processes by which they were brought about. Chief among the men who have thrown new light on morbid changes and given an impulse to the study of the science of pathology must be placed the names of Virchow and Paget. With Virchow's *Cellular Pathology* published in 1858 a new conception of pathological changes was introduced. They were seen to be perversions of cell nutrition and cell activities, and diseases of the various organs were studied not as such, but as due to morbid changes in the cell elements of the different structures entering into their composition.

Inflammation the most common and important of these processes, has naturally been the battle ground of rival theories. For a long time it was regarded as a purely vascular phenomenon, and all the changes in and around an inflamed area were studied from the point of view of contraction and dilatation of the capillaries and of acceleration or retardation of the current of blood through them. Then exudation of liquor sanguinis into the interstices of the tissues and proliferation of the tissue elements were looked upon as the essential feature of the inflammatory process and later still came Cohnheim's discovery of the migration of leucocytes. It would almost seem that every detail of the changes which take place in the course of a local inflammation is now known. With the progress of this knowledge ideas as to the nature and character of the process have completely changed. Formerly it was looked upon as destructive only; now it is recognised, as primarily, at any rate, defensive—a mustering of leucocytes to oppose the invading bacillus, or a preliminary to repair of damage by the removal of structures too deeply injured to be fit for further service.

While so much is definitely known of the behaviour of vessels, and blood corpuscles, and leucocytes, and tissue elements during inflammation, chemistry has not yet said the last word on the changes in the blood and structures. It is in virtue of some antecedent chemical and consequent physical change in the capillaries and tissues that the leucocytes are arrested and made to traverse the capillary wall, and it is not as an act of volition, but in virtue of some chemical affinity that the phagocyte englobes and disintegrates the bacillus.

The microscope has played the same important part in pathology as in physiology. The structure of all the forms of tumour has been minutely studied, and their relations with normal tissue and with each other ascertained. The generations of all kinds in glands, muscles and nerve centres have been followed from the initial departure from normal conditions to complete disintegration, and the influences under which they have taken place have been investigated.

At all periods clinical observation has been in advance of physiology and pathology, presenting problems for solution, suggesting and stimulating inquiry, and waiting to turn to therapeutic use every addition to knowledge.

Perhaps the first clinical discovery which brought physiology to bear directly on practical medicine was the introduction of physical diagnosis by means of percussion and auscultation, the former by Avenbrugger (1781) and Corvisart (1828), the latter by Laennec (1819). This not only brought the diseases of the chest within the ken of the physician, but opened out a new and wide field for observation. The effects of interference with the circulation by the various forms of valvular and structural disease of the heart could now be followed; the operation of back pressure through the lungs and systemic veins was traced, and the dependence of such symptoms as dropsy upon heart disease became manifest. A most powerful impetus was thus given to experimental research. Both physiological and pathological affections of the different valves were indeed natural experiments on the hydraulics of the circulation.

Lacaze's great discovery of vaccination, unparalleled as to the direct benefit conferred by it upon the human race, was essentially a fact of clinical observation. When, however, its significance was grasped by the genius of Pasteur it became the starting point of bacteriological pathology, which gives the most far-reaching insight into the causation of disease, and constitutes the most important of all the links yet made out between science and therapeutics.

The employment of the thermometer in clinical work constituted another important epoch. We should now think clinical work impossible without it, but there must be many here who, like myself, completed their studies without ever using it, and who remember its introduction by Wunderlich. The thermometer had, indeed, been employed by Celsus, but, either because medical science was not sufficiently advanced so that the profession was not ready for it, or because it was not applied extensively enough, it had not taken hold.

It is not too much to say that the clinical thermometer has revolutionized clinical observation and practical therapeutics. Before its introduction and systematized employment there could be no adequate study of pyrexia, its significance, its causation, or its effects, whether as an incident of inflammation or as the essential feature of fever, or as the fatal factor in hyperpyrexia. Till then the problem of the constant temperature of the body was not before the physiologist, and the researches as to the production and dissipation and regulation of animal heat, fruitful in so many directions, had not even been suggested. Still less had abnormally high temperatures been dealt with as such therapeutically.

Another physiological discovery of far-reaching importance to which clinical observation has led up has been the definite determination of the fact that the ductless glands and probably other glands supply to the blood some material which plays an important part in the nutrition of the tissues, stimulating or modifying the cell activities.

Few histories are more interesting than that of the successive steps by which extract of the thyroid gland was ascertained to cure myxœdema, beginning with the observation that cretinism was associated with goitre, and that the essential feature of this affection, myxœdema, could be induced by extirpation of the thyroid. Upon this, experiment showed that the cause was not the accumulation in the blood of some substance which ought to have been withdrawn from it by the gland, but the absence of some material which the gland supplied.

Older than this, and even more important, was the discovery of the part played by micro-organisms in certain diseases. Here again clinical observation and reasoning had anticipated Pasteur. The communication of disease from person to person, the incubation period which intervened between the exposure to contagion and the development of symptoms, the successive stages which these symptoms followed and the reproduction in the individual of the poison, had given rise to the zymotic theory, according to which the history and course of these diseases were comparable to fermentation following the addition of yeast to a saccharine solution.

Experimental demonstration, however, is now demanded, and the place of theory in medicine is only to suggest and to guide investigation. It was not, therefore, until Pasteur, by the successive steps of his work on the various fermentations on peptone—the silk-worm disease—on malignant pustule and

septic fever—had demonstrated the powers of micro-organisms, and Lister, by that infinite capacity for taking pains, which, when combined with true insight, constitutes genius, had made the totally unexpected and unforeseen extension of the germ theory to surgical affections; until Koch again, in 1882, had identified and made visible the *corpus delicti* of phthisis in the tubercle bacillus—that the microbial origin of these diseases was fully admitted and the sweeping character of this new department of knowledge was recognized.

We may even claim for clinical observation that vaccination was a standing illustration of the attenuation of a virus, and that it anticipated and pointed the way to the processes by which Pasteur has attained such sensational results in hydrophobia and by which we hope and believe that other diseases, such as scarlatina and the fevers generally will be robbed of their terrors.

The bounds of the zymotic theory, properly speaking, have however been overpassed; and indeed swept away, and diseases such as tuberculosis are found to be caused by micro-organisms which appeared to have no analogy with those originally grouped under the name; but science has pushed the analogy between disease and fermentation still farther. Just as alcohol is the potent product of the torula, so it has been ascertained that the products of bacteria are the agents which give rise to the constitutional disturbance of disease, and these products have been separated and identified. Not only so, but just as alcohol, when it has reached a certain proportion, arrests further multiplication of the torula, so do the products of bacteria bring their action to an end, and advantage is taken of this in the antitoxin treatment of diphtheria, which has recently evoked the admiration and challenged the gratitude of mankind.

THE EXCELLENCIES AND DEFECTS OF MODERN THERAPEUTICS.

We have still to ask, What is the bearing of all these advances of knowledge on therapeutics, which, after all, is the object of our lives?

Until the last few years it has not been easy to answer this question by instances of any very extensive applications of physiology to the treatment of disease, and morbid anatomy was at one time a stumbling block in the way of therapeutic effort. The pathologist, pointing to an excavated lung or cirrhotic liver, would ask the physician what he could expect to do with drugs against such conditions. But that stage has passed away, and I will not mock your intelligence by other illustrations beyond those just given of therapeutic applications of physiological and pathological knowledge; or by arguing that all knowledge of normal processes aids in the comprehension of morbid processes, and that we are in a better position to combat disease when we thoroughly understand its causation and initiation, and follow mentally its development, course, and tendencies.

Given the faculty of observation, the insight which penetrates the meaning of the phenomena, the analytical and synthetical powers by which a diagnosis is constructed, the ready adaptation of means to a well-defined end, and the firmness of character required to deal with the frailties of human nature, and the best physiologist will make the best pathologist and the best pathologist the best physician.

As regards the remedies at our command, they are only too numerous. Recourse to a great variety of drugs is fatal to exact knowledge of their effects and to precision in their use, but now ones are added every day for the two or three of those who do not know how to employ the old ones. These have, however, been recent acquisitions of extreme value, heavily discounted, unfortunately, in the case of some by the mischief done through their indiscriminate use—the antiseptic group, the chloral sulphonal group, the salicylates and salicine, the phenacetins and antipyrin class, coca and cocaine. What makes some of these, moreover, far more important and interesting is the fact that their physiological action has been inferred from their chemical constitution.

A fact which brings practical therapeutics into near relation with physiology and pathology is that the active principles of all drugs are isolated, their chemical composition is ascertained, and their physiological action investigated. Pharmacology, in effect, has become a branch of experimental physiology, and the immediate effect of remedies is known

with a completeness and accuracy heretofore undreamt of. All this is working towards a more intelligent employment of drugs, and leads towards the goal of all the efforts to bring therapeutics within the circle of the sciences. This goal is that we should know not only the effects of remedies, but how these effects are produced. This is in the last resort a question of chemistry. As I have said before, all vital actions are attended with molecular or chemical changes; are, from one point of view, chemical actions, and come under the laws of the correlation of force and conservation of energy; so, therefore, are the physiological and therapeutical action of drugs, and obviously the key to the latter is to be found in the chemistry of vital processes. Therapeutics, to become scientific, is only waiting for answers to the questions which she puts to chemistry. Why are sodium salts so much more abundant than potassium salts in the blood, and why are the former almost confined to the liquor sanguinis, and the latter to the corpuscles? We must assume that albuminoid proteids have an affinity for sodium, and the globulins for potassium. With the answer to this is bound up the secret of the necessity of sodium, potassium, and calcium salts to anabolic and catabolic operations, in which they take no traceable part, and of the presence of iron in the blood corpuscles.

Why, again, in the case of substances apparently so similar as potassium and sodium salts will the former, if injected into a vein, even in small quantity, paralyse the heart and destroy life, while we see pints of normal saline solution thrown into the circulation with none but good results? How does prussic acid—the simplest in composition and constitution of all organic substances—prove fatal with such fearful promptitude by its presence in infinitesimal proportion in the blood? How again does morphine suspend the activity of the nerve centres? Chemists must admit that the poisonous effects of prussic acid and morphine can only be due to some molecular change in these substances; they know that if the deadly cyanogen is so tied up that its component atoms cannot fly apart it is innocuous, and that a very slight change in the chemical constitution of the morphine molecule entirely alters its effect; it is an almost irresistible inference from the doctrine of conservation of energy that the change in the molecule, say of the morphine, must be equal and opposite to the molecular change in the nerve cells which it arrests. It seems to me, therefore, that we have in the chemical constitution of the morphine molecule a clue to the character of the chemical change by which nerve action takes place and to the quantivalence of nerve energy.

What then is our position to-day in respect of the three points which we have been following—the recognition of disease, the knowledge of remedies, and the ideas which govern the employment of remedies in the treatment of disease?

The basis of therapeutics is diagnosis, the grasp of the actual condition underlying the symptoms or phenomena, and the greater our command of powerful remedies and the more precise our knowledge of their effects and of the mode in which these effects are produced, the more important does accuracy in diagnosis become.

A diagnosis, to be real, implies not only the recognition of the disease which may be present and an accurate appreciation of the morbid changes which may have taken place in various organs. It embraces a knowledge of the nature and intensity of the pathological processes which have been and are in operation, and of the causes which set them going, and also of the results to which they tend. A further element, moreover, enters into the consideration; an estimate, by the aspect of the patient, by the pulse and temperature, and by other subjective and objective indications, of the impression made on the system, and of the resistance which it is capable of to the lethal tendencies of the disease.

Year by year we see improvement in this respect; not only that hospital physicians and teachers endeavour to carry diagnosis to a greater pitch of accuracy and a higher point of refinement than ever before, but that the entire body of medical men are trained by improved education and systematic clinical teaching to appreciate and to practice careful diagnosis in their daily work.

Diagnosis, we may say, has reached an extraordinary degree

of advancement. There are, no doubt, still new fields to conquer, but in the recognition of diseases, local and general, there is not much which seriously concerns the human race which remains to be done. The same degree of knowledge, however, does not extend to morbid processes. Our comprehension of the significance and essential character of inflammation is by no means complete and satisfactory. The part which fever plays and the place which it holds among the phenomena of disease is far from being fully understood. It cannot have been intended by Nature for the destruction of the subject, and we can see distinctly that in some cases it forms part of the defensive operations; possibly, indeed, its general tendency is defensive, by promoting the production of phagocytes, or possibly a certain elevation of the temperature may be fatal to maleficent organisms which have taken possession of the blood or tissues. We are not certain, indeed, whether in pyrexia the heat-producing oxidation in the structures receives its stimulus from, or takes place at the bidding of, the nervous centres, or, on the other hand, is due to enfeeblement of the restraint which they normally exercise over it, or whether it defies control by the thermotaxic nervous centres.

But here I must stop. I have said enough to show that the much-despised therapeutics, like clinical observation, suggests and stimulates scientific investigation, and I must now take up the last point; the views which guide the medical man at the present day in the employment of remedies.

PERSONAL EXPERIENCE AND PERSONAL PREJUDICE.

Of course our individual guide is mainly personal experience and observation of their effects. But the human mind is so constituted that it demands reasons, and even our experience finds expression in theory. There is, however, no theory which is supposed to apply to pathological processes and therapeutical in general, like the humoral doctrine of Hippocrates and Galen, the various iatro-chemical and mechanical theories, the animism of Stahl; the stimulant, contra-stimulant, or organicist ways of accounting for everything—no theory of universal application. Yes! Homeopathy still, like a belated ghost, haunts the dawn of scientific medicine, and men are still found who wear its doctrines as a cloak for ignorance, or flaunt them as an attraction for the more foolish and credulous of the old ladies of both sexes.

But while our minds are not dominated by any *a priori* conception of a vital principle governing all vital operations, we must not flatter ourselves that we cannot be carried away by fashions in treatment. In our own day, under the influence of Todd, alcohol was largely accepted as the universal panacea, and for nearly a generation mercury was almost banished from the *materia medica* on theoretical grounds. The last twenty or thirty years have afforded us increased opportunities for the study of syphilitic diseases of the nervous system and of hereditary syphilis because of the abandonment of mercury in the treatment of the primary disease. And if we have no comprehensive theory of disease or treatment we have our small working hypotheses. To one man gout explains everything, and the more hazy or inadequate his idea of what gout is the more satisfactory the explanation. Gout, moreover, is accepted by the public as accounting for everything. The permutations and combinations of which uric acid is capable, and its ingenuity in giving rise to the most varied forms of disease, are truly wonderful.

To another man the clue to treatment is acidity, or bile, or disease of the liver.

Names have still a great influence, and the lesson which Galen constantly enforced, that we must treat not the disease but the patient, is as necessary in our day as in his. It does not follow that because we call a pain rheumatic, the remedy is salicylate of soda.

At one time the action of quinine was supposed to be explained by calling it an antiperiodic, and any tendency to periodicity in the recurrence of symptoms of whatever kind, or at whatever intervals, was considered to be an indication for its exhibition.

It is inevitable that our imagination should be impressed by the revelation of the wonderful part which micro-organisms have been found to play in the genesis of disease, and that our thoughts should turn towards antiseptics in our treat-

ment. So far the greatest success has been in dealing with microbes outside the system, as in antiseptic surgery and preventive medicine, and further triumphs are to be hoped for in this direction, as, for example, in the prevention of tuberculosis. We have as yet little evidence of the power of antiseptics to follow and destroy the microbes when they have once got possession of the system. Quinine, however, kills the malarial plasmodium, and we have now the antitoxic serum. Apparently, too, one virus may be antagonistic to another, and an attack of small-pox has often seemed to cure phthisis. We must continue our efforts to apply antiseptic principles, but it is most important that we should not allow ourselves either to imagine that we have obtained effects which have not been realised, or to attribute results to antiseptics which may have come from other causes. It is not yet clear that any considerable impression has been made on the mortality from phthisis by guaiacol or creasote; and was not sulphuretted hydrogen, injected into the rectum, to deliver us from this scourge?

It was inevitable, again, that we should be greatly struck by the remarkable power of lowering the temperature possessed by the antipyretic class of drugs. We seem to have within our reach the means of dealing with our most formidable enemy, and it is a great triumph to be able to point out to friends the effect of our remedy on the temperature chart, especially when it has been accompanied by relief of headache and other symptoms. Here it is very important that we should maintain an attitude of cool observation, and not conclude that in bringing down the temperature we have necessarily exerted a favourable influence on the course of the disease. We may have been bringing down also the patient, and it is not so certain that Nature does not know her business when she sets up febrile reaction. I feel myself justified in re-echoing the warning given by Dr. Douglas Powell on this point.

But it is time that I should bring this long and disconnected address to a close, and in thanking you for the patient attention with which you have listened to it I congratulate you and myself that we live at a time when the art of medicine has made such progress, when science in its application to medicine has brought such marvellous and such beneficent aid to therapeutics, and when our beloved profession stands so high in the estimation of the world.

ADDRESS IN SURGERY

BY

JONATHAN HUTCHINSON, F.R.S.,

F.R.C.S.,

Consulting Surgeon to the London Hospital.

At the Annual Meeting of the British Medical Association at London, July-August, 1895.

THE LATE MR. DURHAM.

MR. PRESIDENT AND GENTLEMEN,—My first words must of necessity be an attempt to express the deep regret which you and I alike feel at the sad event which has been the cause of my coming before you. We had all looked forward with high anticipation to the pleasure of listening to an address on surgery from Arthur Durham. The hand of death has snatched him from us, and put a stern veto on our hopes. It is not too much to say that the whole profession deplores Mr. Durham's too early death as a heavy loss to surgical science, whilst to many of us it brings in addition deep sorrow for a much-loved friend.

The peculiar circumstances under which, at the desire of my friends and at very short notice, I have undertaken to give this address will, perhaps, plead my excuse if I avoid all attempt to bring before you anything original: I purpose rather to offer you a brief retrospective glance at the surgery of past, interspersed with a few comments as to what may be hoped for in the future.

SURGERY IN 1790.

In the year 1750 there was published in London by one of Mr. Durham's many distinguished predecessors, A *Critical Inquiry into the Present State of Surgery*. Samuel

Sharp was not only surgeon to Guy's Hospital, he was Fellow of the Royal Society and a man of acute and original mind. He wrote good English, he saw for himself, and he travelled, not merely for self-gratification, but in search of professional knowledge. His work was to some extent the result of a visit to Paris, and he displays familiarity with the practice of all the Continental surgeons of his day. His *Critical Inquiry* was received with so much favour that it was translated into French, German, and Spanish. I may, therefore, fairly take this book as representing the opinions of the day, and as affording to us fair criteria as to the topics which most interested the surgical world in the middle of the last century.

"DREADFUL IN THE DOING, OR MELANCHOLY IN THE EVENT."

Mr. Sharp thought well of his times and his compeers. In his preface he writes, "Perhaps there never was a period of time in which any art was more cultivated than surgery has been for these last thirty years." This, we may remember, was written when Pott was in his prime and Hunter a young man. It may perhaps not be without instruction for us if I glance for a few minutes at the topics which mainly claimed Mr. Sharp's interest. To begin with he dismissed luxations and fractures with the statement that all eminent surgeons were agreed as to the method of treating them. With an almost similar remark he put aside "tumours, wounds, abscesses, and ulcers," asserting that their treatment is "fundamentally the same in every country of Europe." His optimistic belief that finality had been attained in these large departments is to be regretted, for it much restricted the scope of his interesting *Inquiry*. His thirteen short chapters concern hernia, lithotomy, amputations, concussion of the brain, tumours of the gall bladder, extirpation of the tonsils, hydrocele, and a few other matters. A small 8vo of less than 300 pages, and in large type, suffices for what he has to say. Let me repeat that what he does say he says well, but how little there is of it, and how restricted are his topics! What a contrast is presented with the almost limitless multiplicity of the subjects which in the present day claim the attention of his successors! Mr. Sharp's chapter on the extirpation of the tonsils contains a strong recommendation of this simple measure. He remarks "there is not an operation in surgery that in my opinion ought to give an operator so much encouragement. It is neither dreadful in the doing nor melancholy in the event." From this remark we may infer much as to his general experience respecting the major operations of his day. He wrote before the days of laparotomy for intestinal obstruction, and when he gloomily hinted at procedures which were either "dreadful in the doing or melancholy in the event," his thoughts probably went no further than excisions of tumours, amputations, and cutting for stone.

SURGERY IN ENGLAND A CENTURY AGO.

Somewhat more than half a century later another important work appeared on the same lines, but far more thorough in character than that of Mr. Sharp. M. Roux, the distinguished surgeon of La Charité, spent a month in London engaged in the diligent investigation of English surgery. On his return to Paris he published the results of his observations. He had seen Lawrence, Brodie, and Bell operate; of the two former he speaks as young men. With Cooper, then in his prime, he had held controversy as to the possibility of bony union in fractures of the neck of the femur, and had promised to send him a specimen which should remove all doubt. Between the dates of Sharp's *Critical Inquiry* and Roux's *Relation d'un Voyage* the whole of John Hunter's career had passed. The "Father of Scientific Surgery" had now been twenty years in his grave, and the great work of his life, that triumph of genius and industry, his Museum, was already well housed under the guardianship of the College of Surgeons. Roux visited this Museum, and he notes over and over again the extraordinary love which English surgeons had for anatomical preparations.

I do not purpose now to occupy your time by any analysis of M. Roux's book, but I put it forward as a very valuable recapitulation of the surgical knowledge of the day as regards its two most important schools, Paris and London.

As my design is to make some comparison between the present and the past, I shall find occasion hereafter to recur to M. Roux's statements in reference to various special subjects. Some of his more general impressions it may, however, be suitable to briefly mention now. He held that England and France were really the only rivals in the art of surgery. Germany, Italy, and Holland had each, he admitted, produced their names, but they had been isolated and not of the first rank. It did not occur to him to even mention Austria. Russia was but just emerging from barbarism, and the United States, not yet more than twenty years independent, had given no indications of that praiseworthy activity which has been since so successfully displayed.

He found the London hospitals behindhand as regards the classification of their patients, only one of them (the London) having as yet attempted to separate medical from surgical cases. London operators he thought skilful but terribly slow. One of the cost of them he had seen take twenty minutes in the doing of a circular amputation which any foreign surgeon would have finished in a quarter of the time. He thought the attention given to the management of fractures in England much inferior to that in Paris. He much regretted to observe that not only in London but in some other large cities special institutions had appeared for the treatment of diseases of the eye. These he thought to be good neither for the profession nor for the patients. Whilst I cannot agree with him in this, I venture heartily to applaud the sagacity with which he detected a weak point in the management of the Royal College of Surgeons (*"un vice essentiel de cette institution"*). He was amazed that an institution for the advancement of surgery should devote most of its lectures and the best part of its museum space to comparative anatomy. These subjects ought he held to find their place in a museum of natural history. Would that he could see it as it is now. The best part of the new wing, erected at vast cost, is now nothing more than a reading room or place of study for young anatomical students, and its walls are occupied by a collection of skulls and skeletons which have no connection whatever with our art. In place of a museum of clinical surgery, we have a Golgotha of anthropology.

This allusion to the present into which I have been betrayed reminds me that I must here leave M. Roux and his book, and pass on to another and more modern epoch.

SURGERY IN THE LONDON HOSPITALS FORTY TO FIFTY YEARS AGO.

In the year 1854 Mr. Spencer Wells was the zealous Editor of the *Medical Times and Gazette*. I had the honour to be his junior conditor. He determined amongst other projects to endeavour to bring to light the real facts as regards the results of operative surgery, and a plan was devised for the systematic publication in a classified form of all operations performed in English hospitals.

The scheme was wholly Mr. Wells's, but I was entrusted to carry it out. For nearly three years brief records of all hospital operations, collected, as far as we could attain it, with scrupulous regard to accuracy, were regularly published. I hope I shall be pardoned for adverting to a topic which is to some small extent personal, but I believe that those reports were not without their influence on the development of surgical knowledge, and that they present a more accurate picture of hospital practice a quarter of a century ago than can easily be found elsewhere. As such I ask your permission to use them, together with the two books which I have mentioned as supplying material for contrast with the present. These reports were commenced in 1855, and came to an end in 1858. The task of collecting the materials was of the utmost use to my own surgical training. I was every day in the operating theatre of one or more hospitals, and in constant confidential communication with the hospital surgeons of the day. The statements published were in most instances revised by those whom they concerned. It will be easily understood that in many instances I was cognisant of details which it was not permissible to put in print. In this way I was enabled to form strong and clear opinions on various points in practice, some of which have been borne out by subsequent experience, and others not. Amongst others I well remember that there was a time when Mr. Wells, as

well as myself, regarded the operation of ovariectomy as not much removed from manslaughter. We knew of fourteen cases in succession at different institutions, every one of which had ended in the death of the patient. There was a rumour at the same time that a well-known coroner had threatened Mr. Baker Brown that he would hold an inquest in the next case in which he did the operation. Another operation in reference to which I formed a strong prejudice was that of lithotomy. Although at this date Sir Benjamin Brodie had in private practice obtained satisfactory results, and had devoted much attention to the improvement of instruments, yet I could see nothing at the hospitals that was encouraging. A not inconsiderable number of the patients did actually die after it, and of the others it appeared to be the fact that scarcely any were really cured. They were perennial patients, and the same unfortunate man would appear over and over again to be subjected to a repetition of the same torture. There was no single operation respecting which it was so difficult to secure trustworthy reports, and in many instances the reports which I was obliged to record as "cured" were, I strongly suspected, not really freed from stone. It was, of course, long before the days of lithotomy when it was the custom to break a stone into fragments and leave them to find their way out as best they could. The impression which I formed of this operation was such that I determined never to do it; and when in 1853 I was elected surgeon to the Metropolitan Free Hospital, and a good share of stone cases fell to my lot, I invariably did lithotomy. This rule was continued during my surgery to the London, and in continuing my success with that of some of my colleagues, who frequently used the lithotrite, I found nothing to regret. When, however, Bigelow taught us how to complete the operation at one sitting and to remove all fragments, I saw, almost with regret, that lithotomy must henceforth give place. My fingers, however, needed practice in the new operation, and I found to my chagrin that I could not do it so quickly and neatly as those could who made it a special pursuit. One patient unfortunately died, and I felt very sorry that I had not cut him. I determined that I would not do lithotomy *en masse* again, but that I would watch its results in the hands of a zealous friend. From that date onwards I have always on discovering the presence of a stone of a size not demanding lithotomy transferred the patient to my friend. The result has been that during a long series of years we have had not a single death, and what is almost of equal importance, not a single case needing a second operation. All the cases have been adult, if not aged, men, and my list has included two near relatives, two ex-hospital colleagues, two other medical friends, and many strangers. In every instance the recovery has been *cito et juvante* and the result permanent. During the same period I have done lithotomy in a few exceptional cases but they have been only a very few, and in other respects there has been no selection and no case has been declined. Lithotomy as practised in our hospitals forty years ago was for the most part a miserable failure; lithotomy in the present day is, in the hands of our specialists, a joyful triumph. I assure you that I regard the results of my practice in this department ever since I ceased to operate with my own hands with the utmost satisfaction and pride.

OVARIOTOMY AND THE USE OF THE CLAMP.

If, however, the triumph of lithotomy has been pronounced, that of ovariectomy may yet be held to surpass it. This is in part because at one time it seemed yet more hopeless. It needs some courage to attempt, even in the briefest manner, to sketch the history of this victory, so many are the points in dispute and doubt and so much of personal feeling is involved. Let me say then in beginning, what none but a churl will dispute, that to the operative skill, the patient attention to detail, the indomitable determination to go on from good to better, which through a long series of years were displayed by him whom we now honour as Sir Spencer Wells, the credit is mainly due. Yet Mr. Wells was by no means the first in the field, even in what we may consider the modern revival. Mr. Wells and myself did our first operations within two months of each other—he in February, 1853, I in May of the same year. But Mr. Baker Brown had been doing it for several years before, and he was present at both Mr. Wells's first operation and my own. From this date

ovariotomy took a new start. Successes were obtained, the cases were brought before our societies, and surgeons began to be hopeful. For many subsequent years it appeared as if the principle of keeping the end of the pedicle outside the abdomen was the main improvement. This plan I had proposed and advocated from the first, and I had devised for its better accomplishment a clamp, which came into general use and held its ground for a season. Mr. Wells had in the first instance dropped the pedicle into the abdomen, bringing its ends out at the wound, and he considered the latter point an advantage, as keeping open a track for the escape of matter. His first case and more alike recovered, but his after much "foul discharge" from the abdomen, and some with primary closure of the wound. He subsequently used my clamp, and in a letter published many years afterwards very generously acknowledged his indebtedness to it. Mr. Harvey Brown also very promptly adopted the clamp, each having been the circumstances. I may, perhaps, be pardoned if I confess that there was a time when I allowed myself some gratification in the thought that I had myself taken some share in furthering the success of this important and life-saving operation. I bore with such equanimity as I could the discovery that I could not compete with my friend in the ratio of successes obtained, and acting on the rule of conduct that I would never keep a patient in my own hands if I believed that someone else could do what was needed with greater prospect of success, I gave up doing ovariotomies both in public and in private, and used to transfer my patients from the London to the Samaritan Hospital. As to the explanation of my comparative want of success I always felt in some doubt. That I could not keep my experience of the operation on a level with that of Mr. Wells was certain, for he had a special hospital and I only a general one. That lack of the skill which comes only from constant practice was not the only explanation, if indeed the chief, seemed proven by the fact that I had lost some of the very easiest cases which had made no demands on special skill. I was driven to the conclusion that as surgeon to a large general hospital, and in attendance upon all sorts of cases, and erysipelas amongst the rest, I could not keep myself from risks of contagion so completely as was accomplished by the precautions which were at that time enforced at the Samaritan. Another disappointment, however, awaited me. The time came that the clamp was discarded, and with it the principle which I had cherished of extraperitoneal treatment of the pedicle. Operators fell back on the old practice which had apparently been a great failure of cutting off the ligatures short and dropping the pedicle into the abdomen. This plan had been tried in a few cases during the reign of the clamp by Dr. Tyler Smith, and with much success. Mr. Wells was induced to resort to it, but soon returned to the clamp. Finally, however, it has gained the day. No one now practices any other method, and the clamp has even been discarded as unnecessary. It is one of the many difficult problems which changes in surgical practice offer for our investigation to explain why a method of practice which seemed so fatal formerly should be so successful now. In part it may have been that we did not try it fairly, and that the assumption that the tied end of the pedicle must necessarily slough and infect the peritoneum prevented us from giving the method an adequate trial. It may have been that we did not in former times attend sufficiently to the various details included in the expression "ligature of the pedicle," and it is quite certain that we were at time ignorant of the use of antiseptics. Probably the truth is that the latter have made safe what was dangerous formerly, and thus it possibly remains to be the fact that the clamp and the extraperitoneal method when it embraced did really win the day for ovariotomy at a time when no other tactics would have succeeded.

SPECIALISTS AND PERSONAL SPECIALISM.

I must limit to other and yet wider topics. M. Roux as I have told you, saw with much disapprobation the beginnings of specialism in London. He found new hospitals for diseases of the eye, which he thought likely to prove injurious to the interests both of the profession and the public. Many years after the date of his visit to our metropolis I had

myself opportunities of witnessing the results of this prejudice in the wards of M. Roux's own hospital. I then saw cases of extraction of cataracts treated in the open ward, and by the hand of the general surgeon. I saw eye lost by supuration. The same night, I admit, I have been witness in some of our London hospitals, but not so frequently nor at so late a date. Common sense won the day somewhat sooner amongst us. The victory of specialism in diseases of the eye is now acknowledged by all, even by many who still echo M. Roux's prejudices in reference to specialism in many other departments of our art.

Can we, however, refuse to recognise the lesson which the modern practice of such operations as lithotomy and ovariotomy teach us? Are there not also many other procedures which stand on precisely the same footing? Would anyone allow an inexperienced surgeon to extract a gall stone when the services of one who had done many such operations were at hand, or entrust the removal of a large growth to any surgeon, however skilled who was not specially trained as regards that operation? If we could get the gross statistics of ovariotomy and lithotomy for the whole kingdom, I much fear that the ratio of success would be found to fall lamentably short of that habitually secured by our best specialists. I designedly speak of specialists rather than of special hospitals, for it is quite possible that the latter may, when the staff is large in proportion to the number of beds, cease to afford the advantages as regards individual experience which they are designed to do. Good specialists are, besides, sometimes developed quite independently of special institutions. The late Mr. Gutteridge, of Birmingham, is reported to have made a proposal that he should be appointed lithotomist to the United Kingdom, for the reason—almost sole, one in its simplicity—that he could do the operation better than anyone else. He had never had any hospital appointment, yet I have been told by those who knew him well that his allegation was no mere empty boast. The remarkable results in lithotomy in children obtained by Dr. Keegan in India, those of Sir Henry Thompson in lithotomy in adults, those of Mr. Macewen in brain surgery, and those of Mr. Mayo Robson in operations on the gall bladder are all of them, I think, good examples of what we may call personal specialism. Of these personal specialists it may further be alleged that not only do they develop remarkable skill themselves, but they almost invariably succeed as teachers in imparting their skill to others. Most of those whom I have named have in this direction had a wide influence, and there was a time when surgeons flocked from all parts of Europe to learn from Mr. Spencer Wells how to do ovariotomy with success. A man who thoroughly understands his subject in all its details can treat it with an efficiency and ease which are wholly unattainable by others. To encourage specialism in many branches of operative surgery is, then, I cannot but think, in consonance with common sense and common humanity.

THE INCREASE OF OPERATIVE SURGERY.

If any enterprising journal of the present day should undertake the publication of operation-statistics of the plan which I have described as devised by Mr. Spencer Wells thirty years ago, we should soon have before us materials for a most interesting comparison with the past. In the first place I do not doubt that we should be astonished at the enormous increase in the number of operations. Formerly one "operation day" a week was thought sufficient for most hospitals, then it increased to two, and now I suppose there are a few institutions in which every day is not so regarded. Nor is this only in hospital practice. Operations in private practice have probably increased in still greater ratio. I well remember the institution of the first nursing home in London, and a very modest one it was. Before that we had to take our patients into hotels or private buildings. Now, in addition to such luxurious establishments as Fitzroy House, we have Homes and Hostels for the sick without number. There are West-end streets in which every other house is so occupied. The patients are, I believe, in great majority surgical cases, though by no means exclusively. These institutions are, without exception, managed, if not to perfection, at any rate with a degree of excellence above what was dreamed of half a century ago. If I praise the nursing homes what shall I say

of the nurses? Not a home is opened but it becomes provided at once with a troop of beings who, fair, intelligent, gentle, and indefatigable, would seem to have been created for their special work. What this class of young women did before nursing was invented is a constant puzzle to me. Its difficulty is equalled only by the question as to what becomes of them, for I never have yet seen one who was even approaching middle age.

If it be asked what are the special operations which have thus increased, the reply must be that they are most various, and that on the whole they are such as conduce most definitely to mitigate suffering and to prolong life. Permit me to take one as an example. It shall be one in which the development of sound doctrine as to pathogenesis, rather than augmented surgical daring, has gained the triumph. No one ought now to die of cancer of the tongue, for nothing except neglect of the early stage can bring about such a result. It is the doctrine of "the local origin of cancer" and of "a precancerous stage" which has placed us in this position. In former days no operations were, with the rarest exceptions, performed for this disease; and if they were, it was in the late stage, when, to use the forcible expression which I have quoted from Mr. Sharp, the procedure was both "dreadful in the doing and melancholy in the event." Cancer of the tongue was, in fact, hardly ever diagnosed until it was too late to operate. One of our most popular surgical manuals taught that enlargement of the lymphatic glands in the latter afforded one of the best means of distinguishing between syphilitic and cancerous disease. We should now regard it as evidence of almost culpable delay, and as implying that the case had advanced too far for surgical aid. That distinguished surgeon Mr. Syme was a pioneer in this branch of operative surgery as in many others. I well remember to have been one of a crowded audience in the theatre of the Edinburgh Royal Infirmary, assembled to witness what I had never seen before—an excision of the tongue. The symphysis of the jaw was sawn through, and its halves dragged apart. The operation was most dexterously done; it was most complete, but at the same time it was most formidable. The patient died a few days afterwards. This case was, I believe, the third in succession that Mr. Syme had lost, and he as a conscientious man determined never to attempt it again. There are surgeons now living—more than one—who can boast of their operations for cancer of the tongue by the score, if not by the hundred, and with no appreciable mortality. These are not, however, cases such as those which alone Mr. Syme attempted; a majority of them are cases in which the operation is in itself a mere trifle—the excision, it may be, of only a very small part of the organ. Year by year the number of cases in this category increases, and that of those in advanced stages diminishes. What hinders that all cases of cancer of the tongue should be submitted to operation in the earliest stage? Nothing excepting defective diagnostic capacity on the part of members of our own profession. The fault is but rarely on the part of the patient. I never yet met with a patient to whom it was kindly yet confidently told "You have got cancer" who did not gladly and without delay assent to what was recommended.

THE ADVANTAGES OF EARLY OPERATION.

In another department of surgery our work has also enormously increased, partly in connection with improved methods and partly from sounder principles of diagnosis. In the case of the tongue it is improved diagnosis only whilst in that of the female breast it is that in large part, but in still larger the modern methods of dressing which now enable us to promise to the patient a painless operation and a speedy convalescence. There never was anything formidable in the performance of an excision of the breast, but I well remember the time when the prospect of a febrile illness with troublesome suppuration and a succession of dressings scarcely less distressing to the patient than the operation itself, acted as a very powerful motive to the surgeon for delays which were very dangerous. No case was ever operated upon until the diagnosis was as clear as daylight, and until in but too many instances the disease was far advanced.

The class of symptoms by which our textbooks taught us as students to recognise cancer of the breast were for the most part, as in the case of the tongue, those present only in

the late stage. Those which we now teach to our students are of a wholly different class. What would be thought of the surgeon in the present day who should inculcate reliance upon such matters as the retraction of the nipple, the "saddle-leather" state of the overlying skin, or the unhealthy condition of the ulcer. We now trust solely to the trained finger to recognise the character of the induration, and we lay down an inexorable precept that if there be any reasonable doubt the breast should be removed. Our patients as a rule accede without much reluctance to our recommendations, for they know from general report that the modern operation is a mere trifle. The result of this change of practice is that the statistics of cancer of the breast must be rewritten. Those collected so laboriously three or four decades ago are no longer in the least applicable to our present results. Permanent recoveries after removal of the breast for scirrhus as after those of part of the tongue for epithelioma are now common in the practice of all operators.

THE EDUCATION OF THE SURGEON.

So much has been said or implied in the discussion of the last two topics that the present becomes a suitable place to introduce a few remarks upon the all-important topic of the educational training of the surgeon of to-day. The great examining bodies which exercise such a large influence over the destinies of our profession in presiding at its admission-portals have recently decreed that the education of the medical student shall be extended over five years. For myself I may say that, although in committees and council-rooms I have always consistently given my vote in favour of this addition of a year, I have never been a warm advocate of the measure. It has always appeared to partake too much of the faith that if you only keep a horse long enough at the water you can make him drink. The additional year must make medical education more expensive and may possibly hinder some of precisely the class which we wish to attract.

The suggestion which I have made as to lithotomy—that it is a very successful and happy procedure in the hands of a man well practised in its performance, but much the reverse in those of a novice—leads on to the remark that there are many others in the same position. There are operations which are good in themselves, and based on sound rules of surgery, but which are yet not for every surgeon's knife. Concerning many it is true that anyone decently trained on the dead body, and clever with his hands, can do them just as well as the experienced operator. Amputations, excision of tumours, resection of joints, ligation of arteries, and many others come into this category. Respecting these the old adage which declares that a barber learns his trade by practising on fools does not apply. Some of them are besides of such a nature and so rarely required that no one can possibly obtain much personal experience. Others there are, however, respecting which I cannot but think that the canon of surgery should be that unless the skilled diagnostician and the skilled manipulator are at hand it is to the patient's advantage that they should be avoided altogether. In that category I place with many others operations on the gall bladder and kidney, those for cancer of the bowel, laparotomies for obstructions, and trephining for abscess or tumours of the brain. In most of these the patient has some chance of recovery if he be left alone, whereas he has almost none if an unskilled operator take the knife in hand.

The estimate of the patient's chance of recovery and prospects of life without operation have been strangely neglected by some zealous operators of the present day. To put it in other words, in order to justify the plans which they recommend, they have, as it seems to me, drawn far too black a picture of the alternative probabilities. When Sir Everard Home's big silver catheter for enlarged prostate was laid aside, and we found that a soft rubber or gum flexible tube could be got in just as easily, and that the patient could be easily taught to use it, we were some of us sanguine enough to believe that the horrors of the senile prostate were pretty much at an end. For myself I may confess that I think so still.

Few, indeed, have been the cases in which of recent years conditions have presented themselves in connection with enlarged prostate which have seemed to require any other measures than the flexible catheter and the irrigator, and many are those which I could quote in which patients who

for a time suffered severely are now leading comfortable lives. Yet we are gravely asked to believe that when a man has had his testes removed, and subsequently passes his water better than he did, the improvement is consequent on the operation. We might as logically attribute it to his having had his hair cut. Operations upon the prostate itself stand on a different footing, for it is obvious that, if the patient survives the excision of the middle lobe, he is as a matter of mechanism in a better position than he was. These procedures are, however, in themselves dangerous, and I submit that the nature of the disease is not such as to demand them.

Many years ago I was the consultant in a case in which a lady had a cicatricial stricture of the oesophagus. We had tried bougies most carefully without success. She could swallow nothing, and death by starvation seemed imminent. The hour for the operation of gastrostomy was accordingly fixed and all preparations made. On the preceding evening I made, under an anæsthetic, a last attempt to get a small instrument through the stricture. I did not succeed, but very shortly afterwards the patient drank some milk. Next morning she could drink better, and I gladly agreed to defer the operation. She subsequently got well without it, and lived in comfort, on fluids, for some years.

About the same time I had in the presence of all my hospital colleagues a patient on the operating table in whom I purposed to open the abdomen for the relief of abdominal obstruction. It was a rare procedure in those days, but I was then an eager operator, and it was with much reluctance that I yielded to the representations of my colleagues, who urged that the case was too far advanced, and that if I proceeded the patient would probably die on the table. This patient recovered, the bowels acted the same day, and she regained good health. These two cases made a great impression upon my mind as to the possibilities in apparently hopeless conditions, and that impression has been deepened by many others which have occurred. Respecting laparotomy for intestinal obstruction of unknown causation, whilst I feel very certain that it should be shunned by all excepting the specialist, I do not feel sure that it is legitimate even to him. Here and there I admit a patient has recovered—a band has been divided, or a gallstone excised, or a kink untwisted. As to the ratio which exists between the survivals and the deaths, we have, however, no statistics whatever. It is a subject in which I have through all my professional life taken a keen interest. These operations were done in my youth. Although more frequent now than formerly, they are no novelties. As a student, I collected such facts respecting them as I could get, and I collect them still.

CONCLUSION.

I have touched, Mr. President and Gentlemen, in, I fear, a very fragmentary manner upon a great variety of topics, and there still remain many upon which I should have liked, did time permit, to have said a few words. I must, however, conclude. If there has been any one connecting thread running through the discourse to which you have so patiently listened it has, I think, been this—the desire to enable you to grasp with clearness and without prejudice the tendencies of modern surgery. In attempting this I have done my best to look at our profession as an organic part of our social polity, and to regard it solely in reference to the public good. The profession of surgery exists not for the enriching or ennoblement of individuals. The operator must not seek to display his own skill or to gratify his own predilections; and the student of physiology, if he be also a surgeon, must always remember that there are other claims upon him than those of devotion to pure science. As practitioners and as teachers we must always keep in mind that our first and foremost duty is to make our knowledge available to those around us. Regarded from this point, it is a source of the keenest pleasure to believe that those engaged during the last half-century in the cultivation of our art of surgery have done their work with honesty and zeal, and with very remarkable success. It has been the work not of few but of many, and not of one or two nations, but has been shared in by the whole civilized world.

The surgical skill now at the command of the community is of a far higher class than it was when Sharp wrote his *Inquiry* or when Roux visited our island. All maladies which

were then wholly outside its scope have been brought easily within its grasp. Nor is it otherwise than a source of satisfaction that, whilst this has been effected, it is probable also that surgical services have been made less costly. In our art, if in anything, it is true that the best things are in the end the cheapest. That which is to the pecuniary advantage of the patient is far from being always the same to the surgeon. The man who improves the art of healing and renders cures more rapid does so very often greatly to his own disadvantage so far as emolument is concerned. This is, I think, an aspect of the case which we may very fairly offer to the attention of the public when we ask it to find material support, not alone for our hospitals, but for the schools of medical teaching which are associated with them. The effort of the profession to improve the standard of knowledge is one in which we all take pride and pleasure, but it is far from being conducive to pecuniary gain.

Mr. President and Gentlemen, I thank you for the patience with which you have listened to my address: I conclude with an expression of faith, in which I feel sure we shall all agree, that we have reason to be very thankful for the progress of the past and very hopeful for that of the future.

AN ADDRESS

DELIVERED AT THE OPENING OF THE

SECTION OF MEDICINE,

At the Annual Meeting of the British Medical Association, held in London, July-August, 1895.

By F. W. PAVY, M.D., LL.D., F.R.S.,

Consulting Physician to Guy's Hospital.

MICROBES, TOXINS, AND IMMUNITY: A PRELUDE TO THE DISCUSSIONS TO TAKE PLACE AT THE MEETING.

Division of labour constitutes one of the results of civilization. In our calling as members of the medical profession our province is to combat disease. It is through the medium of knowledge that we perform our part. One of the primary objects of the British Medical Association is "the promotion of medical and the allied sciences," and we meet here to-day to further this object. Science expounds and art applies. Through science the knowledge is attained. Art then steps in and is associated with the application of the knowledge to a practical end—in other words, with the exercise of our calling as medical practitioners. Upon knowledge our usefulness depends. It is knowledge which gives us the power to shape conditions in such a way as to produce a desired effect. We command the attainment of results by the knowledge of how to provide the conditions for bringing them about. Under the idea entertained previous to the discovery of the circulation that a vital spirit from the air existed in the arteries, and that the blood ebbed and flowed in the veins, how was it possible for practice to be based upon anything sound? From this time our position has advanced first in one direction and then in another until now, when it may be considered that our art is based upon exact science. Anatomy, minute anatomy, physiology, pathology, and the study of the precise action of drugs have all contributed their share to placing us in the position we now occupy. A new line of study, however, has recently sprung up which has opened out an entirely fresh view before us. But a few years ago bacteriology was unheard of, and look at the important information it now gives us. A new departure has been created by it in both medicine and surgery. In relation to operative surgery it has laid the foundation for success which was previously thought to be quite unattainable, and in that branch of practice it has led to the production of greater surprise than in our branch, as the now known effect upon the healing process of the exclusion of micro-organisms had not hitherto entered the mind. In medicine, on the other hand, suspicion has for a considerable time existed that certain diseases might be attributable to the invasion of the system by micro-organisms. Our countryman Dr. William Budd, in 1859, urged that cholera and typhoid fever were due

to a microscopic living organism. I remember accounts given of attempts having been made to capture the organism in cones placed above the head of the patient. Nothing for a long while resulted towards bringing home the connection of disease with micro-organisms. Fever germs were talked about without anything definite being established.

The discussion at the Pathological Society in 1875, on the germ theory of disease, marks an epoch in the history of the subject, and shows that up to that time no decided progress had been made towards settling the question; for whilst some spoke in favour of the theory, no less an authority upon fevers than the late Dr. Marchand expressed himself strongly against it. Since then, however, knowledge upon the point has advanced in great strides; and, as we are all now aware, not only has it been clearly ascertained that different organisms are productive of different diseases, but the distinguishing form and life-history of many of these organisms have been definitely made out. To Pasteur we owe the initiative in this matter. Once the discovery made that a micro-organism was to be found in the body in association with a particular form of infectious disease, the foundation was laid for further research, and it soon became known that the organism could be cultivated outside the body, and, thus cultivated, was capable by inoculation of producing the disease. The start was now given, and bacteriology has since grown into an important science belonging to medicine, which has already much advanced our position, and promises to do so much more. Bacteriology is no more abstract science, devoid of useful application. It gives us knowledge which enables us to control disease in a manner that could not be accomplished before. Knowing irretrievably that a particular disease is due to the invasion of the system by a specific living organism, we are taught that our first efforts should be directed to preventing the dispersion of the organism from an infected person to those around. To what extent we have the power of doing this is shown by the successful manner in which a disease that may have intruded itself amongst us may be stamped out. See how the spread of cholera has been barred in this country by the measure employed to restrain the dispersion of the bacillus. Truly through the knowledge that has been acquired during the last few years an immense power has been placed in our hands for doing good to our fellow-creatures. But the prevention of the spread of disease, the lines of procedure for effecting which we have been taught, is only one of the services rendered to us by bacteriological science. In the early days of bacteriology it was found that the bacillus might be brought into a weakened state, and that if introduced into the system by inoculation in this state it only produced a mild form of affection unattended with danger to life instead of the ordinary form of disease. Common experience has long made us aware that a person who has passed through an attack of an infectious disorder is not liable to the same extent as before to contract the disease on exposure to contagion, and that should he contract it the course run will assume a mild character. Out of these two factors we get command of some moment in the direction of providing escape from serious effects arising from the disease. Two modes of bringing the bacillus into an attenuated state are open for employment: one by conducting its artificial cultivation in a particular way, the other by transmission through the system of an animal differing in nature from that in which the disease naturally occurs. The latter is represented by the system of dealing with small-pox, which started with Jenner at the close of the last century. Jenner's discovery consisted in showing that vaccination with the lymph of cow-pox affords as much protection against small-pox as an attack of small-pox itself. He knew nothing about the virus of small-pox being attenuated by passage through the system of the cow.

Another method of combating disease, more recently revealed by the teachings of bacteriology, is by availing ourselves of the efforts of Nature to counteract the effects of the bacillus. In the case of some affections it has been made out that the pernicious results are due not to the direct action of the bacillus, but to the development during its growth of an agent which acts in the manner of a poison to the system. This material, known as the toxin, on being produced leads to the

generation in the system, by as it were a conservative effort of Nature, of a counteracting principle which has received the name of antitoxin. We have the poison and its antidote to deal with, and the result may be considered to be dependent upon which is the stronger of the two. This is valuable information to have obtained, and no one can conjecture how much more remains to be disclosed by the further prosecution of research. It follows that what is wanted for subduing the disease is a supply of antitoxin, and this it has been found may be obtained from the lower animals. It is the toxin which leads to the generation of antitoxin, and toxin is produced by the bacillus no matter whether it exists inside the system or is cultivated in a medium outside the body. Produced as the result of cultivation outside the body it is susceptible of separation by filtration from the bacillus, and in this state the effect of its introduction into the system of one of the lower animals is to kill if used in sufficient quantity, and in smaller quantity to give rise to the production of antitoxin which, with suitable arrangements, may be procured in a form to be susceptible of employment as a therapeutic agent.

Here lies the principle of the modern treatment of diphtheria by the serum of the blood of the horse which has gained certain remarkable therapeutic properties by being charged with antitoxin by the repeated introduction of a suitable quantity of diphtheria toxin into the system. In the discussion about to take place on diphtheria we shall all look with deep interest for information regarding the practical value of the treatment. Those to whom we are to listen are qualified to speak authoritatively on the matter, and the prospect is presented of a useful addition being made to our stock of knowledge as a result of the proceedings here to-day. In connection with the subjects for discussion both to-morrow and on Friday the view is broached that a microbe plays a part, and it remains for us to see what the speakers will tell us upon the point. Without further prelude, I will now call upon Dr. Martin to open the discussion on diphtheria.

AN ADDRESS

DELIVERED AT THE OPENING OF

THE SECTION OF SURGERY

At the Annual Meeting of the British Medical Association at London, July-August, 1895.

By Sir WILLIAM MACCORMAC, F.R.C.S.
Surgeon to St. Thomas's Hospital.

SOME POINTS OF INTEREST IN CONNECTION WITH THE SURGERY OF WAR.¹

GENTLEMEN,—In taking the chair, I desire to express my great appreciation of the compliment paid me by being selected to preside over the Surgical Section of our Association at its meeting in London.

I believe we shall do important work and learn much to further the progress both of our science and our art from the eminent surgeons who will take part in the discussions, and favour us with communications.

On behalf of the officers of the Section as well as myself I have to extend a hearty welcome to all the surgical members of our Association present with us to-day, and most especially to those foreign surgeons who, at much inconvenience to themselves, have come to take part in our proceedings.

It has occurred to me that it might be interesting were I to begin the business of the Section by a few remarks on some of the many points of moment in connection with the surgery of war. For forty years we have not been engaged in European war, fortunately for ourselves. Yet since upon our effective preparation for time of war our predominant position, indeed, our existence as a nation, depends, all must take an interest in these matters.

As the chief duty of a general is to bring his men into the

¹ The address was illustrated by a large number of wet and dry preparations of gunshot injury, by a series of bullets fired at various ranges, many showing deformity, as well as by photographic lantern slides of the effects produced by the new projectile upon the human cadaver.

fighting line as physically fit as possible, and to be as little hampered as may be by sick and wounded, it is hardly possible to overestimate the value of a carefully prepared military medical organization, or to lay too great stress on the responsibilities which devolve upon the medical officers in the field. The chief surgeon of the army should not only possess the willing support of his executive staff, but he should be, and generally is, the right hand man of the general commanding, enjoying his full confidence and active sympathy, else the disasters which have occurred before may occur again. This unfortunately is not his position in our army, for in spite of strenuous opposition from the Medical Department he is placed on the staff of the officer commanding the lines of communication, and not, as in most other armies, on the staff of the commander-in-chief.

The modern rifle has introduced changes which have excited universal attention. This weapon sends a small hard projectile with enormously increased velocity to a much greater distance, and with greater precision, than was previously possible. The cylindro-conoidal projectiles of the Minié rifle and the Chassepôt and the ovoid bullet of the needle gun were an immense advance upon the round bullets of Brown Bess, but the new projectile possesses even greater advantages. Our troops used the Lee-Metford rifle in the recent Waziristan expedition and later in Chitral. In storming the Malakand Pass during the advance to Chitral an immense quantity of ammunition per man was used. The Lee-Metford with cordite powder worked very successfully. The volleys even were almost smokeless and noiseless, and wrought great havoc in the enemy's ranks. Examples of gunshot injury from this source have not yet come to hand.

Here are a number of fractures produced by the needle gun and Chassepôt rifle bullets comparatively large masses of lead weighing respectively 500 grs. and 380 grs. Some of the specimens show the great shattering effect produced, others guttering of the bone, and some present a characteristic key-hole aperture with long fissures radiating from it.

Except cases of accident and suicide there are as yet but few specimens obtainable of the effects of the modern bullet on living persons, but we have a large experimental record from various countries of the effects produced both on the human cadaver and on animals.

The experimental results are not exactly similar to those obtained in actual warfare, as the effect of a bullet striking a dead body is necessarily different from that it would have on a living person. Many experiments have been made at short ranges with reduced charges of powder to diminish the uncertainty of striking the part aimed at, but the results obtained by this method differ materially from those obtained with actual charges.

Experiments as to the manner in which the projectile acts upon the human body at different distances are of great practical value. They enable the surgeon to obtain beforehand a of the probable character of similar injuries indicated knowledge during actual warfare and the best way of dealing with them.

During the last twenty years there has been a gradual diminution of the calibre of the rifle and in the weight of the projectile, while its hardness has been greatly increased.

The accompanying table gives the more important particulars concerning the rifles and projectiles adopted in different countries.

From this table it will be seen that the modern weapon very slightly differs in calibre in different European armies, the bore varying from 7 millimetres (0.280 in.) to 8 millimetres (0.315 in.) in diameter, and, except in Roumania and Spain, the difference in weight of the projectiles is so slight that for practical purposes it may be disregarded. They vary from 215 to 225 grains, and their greater density and increased length render them, weight for weight, smaller in proportion than the soft leaden bullet.

The form is an elongated cylinder with a rounded extremity composed of a hardened leaden core surrounded by a jacket of either steel, copper, nickel, or German silver. Its length is about four times its width, and it receives from the rifling a rotatory movement of about 2,500 revolutions per second, and an initial or muzzle velocity of 1,800 to 2,500 feet per second.

The projectile now adopted in our army has a central core of lead hardened with antimony, surrounded by a metal jacket hardened with a small alloy of copper. It weighs 215 grains, and resists to a remarkable degree the tendency to change the shape on impact which was so noticeable in the old bullet; and this fact, together with its small diameter, enormously increased velocity and penetrating power, causes it to produce very remarkable wounds.

The range is about 3,500 yards, a little over two English miles, the trajectory is flatter and the direction more true, results attributable to the diminished resistance of the air to the projectile and the greater driving power of the new powder.

The factors which determine the amount of damage inflicted by a gunshot wound are the unalterable form of the projectile, as well, of course, as its size, the velocity on impact, and the resistance of the tissues struck. Hitherto about nine-tenths of the wounded on a modern battlefield were disabled by rifle bullets, and the proportion will not diminish with the use of magazine rifles capable of firing some sixty shots a minute and carrying immense distances.

I have already said that the experiments made have given somewhat conflicting results. One series conducted by

Bruns, Delorme, Habart, Lagarde and others were made at fixed ranges with reduced charges of powder, the initial velocity being thus reduced to that the projectile would have at given distances of 100, 500, 1,000 yards, and so on.

Speaking generally, wounds inflicted in this way appear to produce a less serious injury than the old leaden rifle bullet caused. The experimenters found that at what corresponded to short ranges up to 400 yards, explosive effects were produced by both, and the injury caused by the projectile of hardened lead covered with a German silver jacket did not materially differ from that produced by the old leaden ball. The old bullet ceases to cause these results at 250 or 300 yards, although up to this distance it is capable of producing them in a marked degree. The explosive effects of the new projectile are found up to 350 or 400 yards, and often much farther.

EXPLOSIVE EFFECTS.

The degree of explosive effect depends on the high velocity, as well as the size and hardness, of the projectile, and the resistance of the part struck. Vascular tissues, cavities like the skull filled with semi-fluid matter, and organs like the liver or spleen, are liable to suffer most from the so-called explosive influence. By this term is not meant the injury caused by the forbidden explosive bullet which the terrible appearance of the wound so strongly suggests that in war time allegations are constantly made that these prohibited missiles are employed. The entrance wound may present nothing peculiar, but the soft parts within are pulped, and the destruction of tissue extends for a considerable distance around the bullet track. The exit wound is large and lacerated, as if the soft parts had been burst outwards. When the bone is struck it is extensively comminuted, pulverised, and driven in all directions into the tissues. The wound beyond the bone is conical, the apex at the bone and the base at the surface.

When an empty leaden box or tin, or an empty skull, is traversed by a bullet, the openings of entrance and exit will closely correspond to the size of the projectile, but if a closed or partially closed vessel of this kind be filled with wet sawdust, water, jelly, or damp clay, and a similar projectile is fired at it from the same distance, it bursts and the contents escape.

William Busch was the first to suggest that these effects were the result of the sudden increase of hydraulic pressure in the part struck. This explanation is not strictly accurate. The pressure is not truly hydraulic, as it is not exerted equally in all directions, but chiefly in the direction of the flight of the projectile, and it occurs in almost equal degree in both closed and entirely open leaden vessels filled with fluid or jelly. The cubic capacity of a closed vessel is in many instances increased nearly by a third, and in the open vessel the increase is one fourth or fifth. The increase in volume is as much as 300 times the bulk of the projectile. The bullet also appears to have already traversed the vessel before this hydraulic influence has had time to take effect, for in many instances the displaced leaden tags at the exit wound can be restored to their original position, and the completely circular opening by which the bullet emerged reproduced. Water has, in fact, an astonishing power of resisting the progress of a bullet which, although capable of travelling perhaps 4,000 yards through the air will be arrested altogether after traversing three or four yards of water.

Within the short time at my disposal it is impossible to discuss this difficult subject, but the explanation of the extraordinary development of explosive effect seems to depend on the rapid arrest of the flight of the bullet on piercing fluid matter, and its motion being transferred to the parts immediately surrounding it, and these again transmitting it to parts further removed, somewhat as wave circles are produced by a stone dropped into the smooth water of a pond.

EXPERIMENTS WITH REDUCED CHARGES.

Bruns's experiments may be taken as a type of those made with reduced charges. He found intense explosive effects up to 400 yards. These attained their maximum in the skull, the bone being fractured in all directions, and upon semi-fluid organs like the liver, spleen, a full stomach, or intestine, terrible damage was inflicted. In the elastic lung tis-

sue, however, or upon empty viscera, no effects of this kind followed. When the bone was implicated the track as far as the bone was usually no larger than the ball, but the tissues beyond were always extensively damaged, and the exit wound was very large.

At a distance of 400 to 800 yards explosive effects were only witnessed in the skull. Soft parts were traversed by a narrow channel no larger than the bullet itself, and with but little damage to surrounding tissues. The joint ends of the long bones presented keyhole openings accompanied by much less extensive fissuring than was formerly the case. When the shaft was implicated the comminution was not extensive, the fragments were large, not detached from one another, and the exit wound small. At a range of 800 to 1,200 yards explosive effects were only occasionally produced in the skull, and in a much diminished degree. In soft parts a narrow channel was made with little surrounding damage. In the spongy bones perforations occurred with but little fissuring, and in the compact tissue of the shaft there was comparatively little comminution.

These favourable effects were produced although the projectile still retained its high velocity and straight direction. In the soft parts the narrow tract was smaller than the diameter of the bullet, the entrance opening was about 5 millimetres (0.20 in.) and the exit 6 millimetres (0.24 in.) to 7 millimetres (0.28 in.). In the expanded joint ends of the bones the fissures were short or altogether absent, which was never the case with the leaden bullet. In the skull there were simple perforations and little damage to the brain tissue, and the same could be said of the lungs and other viscera. Beyond this distance, at a range of 1,200 to 2,000 yards or upwards, Bruns, Delorme, Habart, and Lagarde found that the damage to bone and other parts became again extensive. The projectile had probably lost its accurate sagittal flight, begun to wobble, and strike sideways, and similar effects were produced by ricochet shots.

EXPERIMENTAL EFFECTS OF FULL CHARGES.

Finding that the experiments of Reger, Beck, and Bruns in Germany, and those of Delorme, Chavasse, Chauvel, and Nimier in France, and the conclusions derived from them materially differed, the Prussian Kriegs-Ministerium recently undertook a series of experiments, conducted so as to exclude sources of error as far as possible, and thus obtain for military surgeons trustworthy information as to the character of the injuries which the new weapon would produce in time of war.

In the first place, full charges of powder were employed, and as the range varied from twenty-five to 2,000 yards, wounds of every description were obtained. These are represented by 1,000 preparations preserved in the Friedrich Wilhelm Institute in Berlin, and the more important are given as full-size illustrations in an atlas of plates issued by the War Ministry.

The results obtained in this way were compared with the injuries inflicted on living persons by the same weapon either accidentally or in cases of suicide, and were found to closely correspond. The weapon employed was the German model 88. Its calibre is 7.9 millimetres (0.311 in.), and the projectile has a diameter of 8.1 millimetres (0.318 in.), so that it is firmly pressed into the rifle grooves, and leaves the muzzle with a movement of 2,500 rotations in the second, and a velocity of 2,100 foot seconds (*vide Table*).

The bodies fired at were covered with shirting to estimate the frequency with which portions of clothing are carried in, and to give the tissues the normal amount of fluidity Wickersheimer's solution was injected, the tension of the blood vessels being approximately maintained by injecting animal blood serum into the arteries immediately before the experiment. Up to 1,200 yards single shots were discharged, and beyond this volley firing was resorted to. The bullets were collected in bags of sawdust, and in the case of each separate shot the bullet was examined in relation to the wound it had produced; after volley firing this of course, could not be done.

Two methods were adopted in the estimation of the results. One was to freeze the part and make a section of the bullet track, and the other was to measure the extent of damage by taking a cast in fusible metal of the interior of the wound, which afforded an accurate model of the destructive effects produced.

The 900 experiments made by the German War Office do not justify Hrana's classification of gunshot injuries into groups according to range. As the range increases there is a gradual diminution in the velocity and energy of the projectile, and a corresponding diminution was observed in the extent of the injury.

It must be remembered, however, that the projectile produces different effects on different organs and different parts of the body, according to their density or fluidity, and even the same part or organ in different individuals will present differences which materially affect the extent of the damage done by bullets fired from equal distances, so that the range of fire cannot be determined with precision from the extent of the injury inflicted. Nor does the size of the entrance wound enable one to draw any definite conclusion. It is larger at short ranges than at longer ones, varying from 7.6 millimetres (0.3 in.) at 100 yards to 5.0 millimetres (0.2 in.) at 2,000 yards range. When the bullet strikes perpendicularly to the surface the opening will be circular with smooth edges, which after an interval become dry and brown. If the skin be wrinkled or loose the wound will be stellate, and when the bullet strikes obliquely or transversely it may be large and ragged. The exit wound is larger and more variable in shape than the wound of entrance. When the projectile emerges perpendicularly to the tissues traversed, the exit wound is circular in about 20 per cent. of the injuries, while a circular shape in the wound of entrance is twice as frequent.

The bullet in nearly every case was found to go straight through the part struck, and the old-fashioned contour shot was never met with. The human body is traversed with ease at 2,000 yards, and the skull, thorax, and abdomen will suffer alike. At less than half this distance the old bullet has lost most of its momentum, and becomes flattened out or impacted when it strikes a bone without penetrating deeply.

Portions of clothing were found in the wound in only two cases up to 600 metres range, but they appear to have been carried in in about 12 per cent. of the total number.

WOUNDS OF ABDOMEN.

In these injuries the liver showed the largest amount of damage, and in some cases of suicide large portions of it were reduced to pulp. Up to 1,200 yards the entrance wound was usually large and stellate and the exit track funnel shaped, with lateral rents extending from it.

In the spleen and kidneys similar injuries were produced. In the intestine each bullet produced on an average three openings, and in some cases as many as eight, and the extent of the damage seemed to bear no defined relation to the length of range. It was more extensive when the intestine was full. At the entrance wound, and, to a lesser extent, at the wound of exit, the bullet caused more damage to the serous coat of the intestine than to the mucous, while in the stomach the converse obtained, and the mucous coat was more extensively injured than the serous.

INJURY OF THE HEAD.

Fearful destruction of skull is produced by a small 5 mm. (0.2 inch) bullet at 50 yards range. The vault is completely shattered, the base extensively split open, and the brain destroyed. The 8 mm. bullet produces similar results, but as a rule the fragments hold together. At 100 yards the entire vault is shattered, fissures extend from both entrance and exit wounds, and a gaping line of fracture was constantly found extending between them. The fissuring around the wounds of exit and entrance shows two different types, one circular the other radiating, and the base is also traversed by fissures. Up to 1,600 yards the fissures gradually diminish or disappear, with the exception of the one connecting the entrance and exit wounds, and sometimes a clean perforation occurs, which becomes frequent at 2,000 yards. The skull when emptied of the brain shows a round keyhole perforation at all distances, but if it be filled with jelly the amount and character of injury are the same as when it is occupied by brain substance. The dura is lacerated to an extent corresponding to the injury to the bone. At short range the brain is pulped and numerous blood extravasations are found in its substance and beneath the meninges. At long

range the bullet track through the brain tissue is cylindrical, the walls are moderately contused, and the calibre of the channel is always less than that of the bullet. Portions of the skull may be carried in at the entrance wound for some distance by the bullet, so that there the injury as a rule will be most severe.

INJURY TO THE LONG BONES.

Gunshot fractures are very frequent and possess great interest. They vary according to which bone, or part of the bone is struck. The effect upon the spongy extremities and upon the compact tissue is very different. From 100 to 200 yards the shaft of the femur is broken up into small pieces for an extent of from 3 to 5 inches, and the humerus from 2 to 6 inches. At the entrance wound in the bone the fragments remain in part attached to the soft parts but at the wound of exit they are completely separated. The adjacent muscles are filled with bone debris and detached fragments of bone, the muscles and tendons are torn and the exit wound in the soft parts is large and ragged. In the spongy bones and spongy extremities of the long bones the crushing and fissuring at short range are also great, but the fissures are often concealed by untorn periosteum, and there is less damage to the soft parts at the wound of exit.

At a range of 600 yards there are occasionally keyhole shots, with radiating fissures in the spongy tissue, and at 800 yards the keyhole channels become frequent, but even up to 1,600 yards or more the compact tissue is extensively fractured. At 1,200 yards the fragments of bone as a rule are no longer driven into the soft parts beyond; but this happens occasionally even up to 2,000 yards.

The conclusion to be drawn from the German experiments is that the damage to the shaft of a long bone is very extensive for all ranges up to 2,000 yards, the main difference being that at short ranges of 200 or 300 yards—for example, the fragments are more numerous, smaller, and more stripped of periosteum, while the converse obtains at longer ranges.

The damage done to the soft parts lying between the fractured bone and the wound of exit is enormous at short distances. Above 700 yards the exit wound becomes smaller and the internal damage begins to diminish.

The experiments also show that the minute external openings these bullets make often bear an inverse proportion to the amount of internal damage. Very small openings of entrance and exit are compatible with enormous destruction of the compact bone tissue traversed by the ball between. The current opinion that the new bullet causes on the whole less serious damage than the old seems scarcely well founded. It was devised certainly with no humane intention, but in order to incapacitate by killing and wounding as many men as possible in the shortest possible time, and it seems admirably devised to ensure this result.

DEFORMATION OF THE PROJECTILE.

The liability to change in form is a very important element in the amount of damage caused by a bullet. A leaden ball is flattened or spread out on striking a bone; it may be grooved by a tendon or fascia or split into several pieces. The amount of deformity depends on the momentum of the bullet, the result of its weight and velocity combined, as well as the resistance of the part of the body struck. The new bullet may traverse the body with little or no alteration in shape, or the resistance may be great enough to crush or split it with a corresponding increment of developed heat. The tip only may be flattened, or the whole bullet converted into mushroom form, with separation of the jacket. The harder the bullet, the less, other things being alike, is the tendency to deformation and the greater the penetrating power. The total number of altered bullets amounted to 45 per cent., but if only cases in which the bone is implicated be taken the proportion is considerably increased. In the hard bones of the horse it amounts to as much as 14 per cent.

Wounds involving the soft parts only never produce any alteration of shape, while the compact tissue of the long bones causes the maximum amount of deformity. The jacketed projectile passes through spongy bones and soft parts without change. Even at short ranges and after striking compact bone, its tip may be only slightly flattened or bent.

A portion of the jacket is sometimes stripped off, and this accident is most frequent with the nickel envelope used for the American rifle bullet, the French Lebel rifle, and in our own arm.

It may be affirmed that the extent of the damage inflicted increases proportionately with the amount of deformation in the bullet. The separation of the jacket and dislodgment of the leaden core occasion injury which often exceeds in degree that of the old leaden bullet, and this was observed at even so long a range as 1,000 yards. A bullet deformed by ricochet will also cause extensive damage, but somewhat differently, as the entrance track will be implicated as well as the channel beyond the bone.

PENETRATING POWER OF THE BULLET; ARREST OF THE BULLET IN THE BODY.

The penetrating power of a bullet is in proportion to the square of its striking velocity, and also depends on its form, density, and unchangeable shape.

The great velocity, comparatively small size, and hardness of the modern projectile render it much less liable to lodge in the body. It nearly always traverses the part struck, and is seldom arrested in the tissues, thus avoiding a source of much after-trouble and suffering.

In the German experiments an unaltered bullet lodged in only three or four instances at ranges of 1,000 to 2,000 yards, and in one case of accidental injury at 2,500 yards the bullet was found in the interior of the skull. The altered bullet is much more likely to lodge, and especially in the shape of detached fragments, such as portions of the jacket or core. The sharp edges of the rent jacket penetrate the soft parts deeply, and readily injure blood vessels.

Habart and Chavoy found that up to 1,500 and 2,000 yards the hard bullets went clean through the human body unchecked even by the hardest bone, and as far as 1,200 yards Bruns never found the projectile lodge. On the other hand, Deforme's experiments and those of Démosthènes prove that the projectile may lodge in some cases even at short range. These may, however, be considered exceptional, while at moderate range it was the rule for a leaden bullet to be arrested in the soft tissues and the bone.

The distressing searching for lodged bullets, and repeated attempts to extract them which formed so considerable a part of the older military surgery will now be largely done away with. Most surgeons of experience have arrived at the conclusion that the wounded often incur greater risks from the protracted search made for the foreign body than any the bullet itself would cause if left alone, a remark which does not apply to the necessity for removing particles of clothing which may be carried in, which are of course septic. Fortunately this is much less frequent now than was the case when larger bullets were used, although it still obtains in about 12 per cent. of the cases.

In time of war also there will be many irregular kinds of injury—those, for instance, produced by ricochet shots. The bullet in these cases will have first struck a wall or the ground, thus altering both its shape and direction, and rendering it capable of inflicting terrible injury, and the long range increases the liability to this occurrence.

HÆMORRHAGE.

The infrequency of serious primary hæmorrhage from wounds produced by the old leaden bullet was quite surprising. Unless some large artery were torn across these wounds seldom caused much hæmorrhage. Of course the contusion of the tissues, while it diminished primary hæmorrhage, was, with the frequent septic changes in the wound, a fertile cause of secondary bleeding. The new projectile does not contuse an artery or push it aside. There is no evidence that an artery is ever deflected and thus escapes injury, and, except at short range, the bullet never wholly divides one of considerable size. A large vessel in the course of the exit wound is usually extensively lacerated if the bullet has previously traversed the bone. The wounds otherwise present an incised appearance; frequently the bullet cuts out a piece of the vessel wall, and the opening seems punched out with sharply-cut margins, like an incised wound. The incomplete division of the vessel prevents retraction, the conditions are less favourable for a spontaneous arrest of

bleeding, and fatal primary hæmorrhage will probably be much more frequent. Cases where a large artery is wounded generally die before help arrives, and it is interesting to know that in the late war in China the Japanese surgeons had such perfect arrangements that in two cases—one a wound of the brachial, the other of the femoral artery—the vessels were tied and the patients saved in the fighting line itself.

TREATMENT.

Perhaps the most important matter to consider is how far the injuries inflicted by the new projectile will be more amenable to successful treatment. In a memorable paper communicated to the first Congress of German Surgeons Voikmann pointed out that the subcutaneous character of gunshot injuries of bones and joints made them less dangerous than compound fractures with more extensive damage to the soft structures produced by other causes.

Subsequent experience has helped to confirm this view. Pirogoff has told us how astonished he was at the easy manner the wounds produced by the small Christian copper bullet healed during the Russian war in the Caucasus. Not only flesh wounds, but often penetrating injuries of the chest and of the joints were readily recovered from with scarcely any suppuration.

During the recent war in Chili it is reported by Dr. Stitt that flesh wounds which had not been probed and thus infected readily healed under a scab, and that the favourable character of long wounds was especially noticeable. The bones were less comminuted and united in about half the time formerly required.

Dr. Rivoiro of Valparaiso has made similar observations. He noticed especially the smallness of the apertures caused by the Mauser bullet, and that the injuries generally were less dangerous to life.

I have received a very favourable account of the character of the wounds caused by the Lee-Metford bullet from Surgeon-Lieutenant Jay Gould, who was present at three actions during the Chitral expedition. He reports that so far as he has seen, or heard from others, the wounds through the soft tissues at both short and long ranges were clean and incised with very little or no bruising, and that they quickly healed. Through the bones clean punched-out holes were made with little splintering, and he said in no case was there any explosive action. The damage caused by the large bore bullets of the enemy was much more severe.

In the British Medical Journal, July 20th, Surgeon-Lieutenant Jay Gould gives an interesting account of twenty cases of the native Swatis wounded in Chitral, in whom the moderate amount of injury inflicted and rapid subsequent recovery are conspicuous.

It appears to me difficult to estimate the extent of gunshot damage to the bone when covered by the soft parts, and Surgeon Gould was not able to examine any instance of fatal injury. He considers the enormous velocity and spin of the bullet cause it to bore a hole through the bone like a rapidly worked drill. But it must be remembered that the bullet has not time to make even one complete revolution on its axis while passing through the body, and only a small fraction of one while traversing the bone. His conclusion that the Lee-Metford rifle is "a perfect weapon from a humanitarian point of view" is, I consider, based upon insufficient premises.

Another interesting report from Chitral has been received in a private letter from Surgeon-Lieutenant Evans, I.M.S. The seriously wounded and dead, he writes, were all carried off the field, but later on many of the Swatis, with uncomplicated wounds of the soft parts, came in to be dressed and were treated by Surgeon-Lieutenant Evans, who reports that these cases healed rapidly and well, notwithstanding the use of dressings very far from aseptic applied by the men themselves. In reply to questions, these patients informed Surgeon-Lieutenant Evans that the reason why none of the more serious cases had come for treatment was that "all the men who had suffered fracture of long bones were dead;" these people knew what they were talking about, because the cases referred to were those of their own relatives and comrades. As regards the Lee-Metford not being capable of stopping "a rush," it seems to me impossible that an enemy exposed to the shower of bullets the new rifle can concentrate upon an

advancing mass of men could carry "a rush," and men hit through the lung bones of the lower extremity or the abdomen could certainly not advance after the receipt of the injury.

During the French war I have often seen Châteaufort bullet wounds heal without suppuration. Long ago I never saw a gunshot wound heal in this way, and indeed considered suppuration inevitable.

BONES AND JOINTS.

In the Russo-Farish war v. Bergmann obtained some astonishing results. He treated severe gunshot injuries of the knee not only with success as regards preservation of the limb, but also in respect of restoration of function, and this even when the bones were extensively implicated. Of 15 cases only 1 died. In 8 there was no suppuration, although in 3 of these the projectile had lodged. Reyer had 23 similar cases without a death. Two instances are reported by the Prussian Surgeon-General of gunshot through the knee at a distance of only 100 yards treated by occlusion which recovered with a movable joint.

Conservation of the limb in gunshot of a diaphysis will in the future be the rule of practice. If the exit wound be large and ragged, and important vessels and nerves are damaged, amputation becomes necessary, but this necessity will depend on the associated injury to nerves and vessels, and not on the extent of the fracture of the bone. When the epiphyseal extremity is the part injured the conditions are also favourable, even when the adjacent joint is involved. In future campaigns, therefore, good hope of success may be entertained of saving life and limb without operative interference in these and similar cases.

LUNGS.

When the new projectile traverses the lung the track is uniformly cylindrical, smaller than the bullet, and smooth-walled with little contusion of the surrounding tissue, and splinters from injured ribs are but seldom driven in. Severe damage was found only where the bullet had struck transversely, had carried in fragments of rib, or wounded a large vessel or bronchus. In many cases no serious symptoms were produced, and a diagnosis was only arrived at by the position of the wounds of entrance and exit. In others there was cutaneous emphysema, hæmoptysis, difficult respiration, and pneumo- or hæmothorax. Death in every instance was due to injury to the great vessels or bronchi at the root of the lung, and, excluding cases of asphyxia, the mortality in the cases recorded was only 12.5 per cent.

The wounds healed in most cases without trouble in three weeks' time on an average. Only once did empyema occur, showing the generally aseptic nature of the wound, and the subcutaneous character of the small openings produced by the bullet. The treatment therefore will be mainly directed to sealing the wounds of entrance and exit, and operative interference will be rarely required except for serious hæmorrhage.

BRAIN.

Unfortunately gunshot wounds involving the brain and the abdominal cavity remain as fatal as before. In the war of 1870-71 about 10 per cent. of the total number of gunshot wounds were of the head, but only about half of these were perforating. In future wars every bullet which touches the skull, even up to 2,000 yards and more, will probably fracture it extensively, and at 3,000 yards the bullet may perforate and lodge. These cases, almost without exception, die either immediately from the injury to brain tissue and shock, or by hæmorrhage and subsequent inflammation. Very few indeed suggest operative interference or any hope of a favourable issue, but to these the ordinary rules of practice would apply.

ABDOMEN.

In 1870-71 a large proportion of the wounds of the abdomen did not perforate the cavity, but in future this will not be the case, as even at the longest ranges the new projectile will traverse the abdomen and wound its contents. In perforating wounds we may assume that some viscous, either the intestine, bladder, or solid organs, has been perforated as well. No probing should be attempted, and Senn's inflation method is likely to do harm by forcing faeces through the wounds in the intestine into the abdominal cavity. Hitherto cases of

this kind have ended fatally, and in the next war it is to be anticipated that the mortality will also be very great. As a rule those injured in this way do not die immediately unless a trunk vessel be divided, but will be carried to the dressing stations and shortly succumb to hæmorrhage, or infective peritonitis, the result of local extravasation, or of matter carried in by the bullet.

Nothing is of avail in these cases but very early laparotomy, for when peritonitis has set in operation will come too late. In civil practice many recoveries take place where the operation has been performed within the first twelve hours, and very few when it is done after a longer interval. It has been proposed to introduce laparotomy as a routine treatment for internal hæmorrhage and visceral wounds of the abdomen. The German Surgeon-General, Professor Senn of Chicago, and others have suggested that the field hospitals should possess an outfit for the operative treatment of gunshot injuries of the abdomen, and that wounds of the viscera should be dealt with by suture, aseptic tamponade, or, in some instances, by partial or complete removal of the injured organ.

Injuries of the liver, spleen, or kidney offer but small prospect of successful treatment, as the damage the new projectile causes in these viscera is usually very extensive. The small apertures made in the intestine will, however, be easy to suture in suitable cases. The frequency of penetrating wounds of the abdomen is so great and the mortality so excessive that any means affording a fair prospect of lessening it should be tried. The field hospital should therefore be provided with all that may be required for operations of this kind.

But I fear that anyone who has seen the confusion of battle, the sudden and overwhelming amount of work and strain thrown upon everyone concerned, and the impossibility of adequately meeting the great emergency will regard proposals such as these as scarcely practicable. In order to perform an abdominal section sufficiently early to be successful it must be done at the first dressing station or field hospital if near enough. There will be hundreds of more or less seriously wounded men awaiting help and it may be impossible to devote the time needed for the diagnosis and immediate operative treatment of such cases. It is very likely, too, that there will be scant assistance available, and the conditions are anything but favourable for perfect asepsis. By all means, however, let a trial be made should the opportunity occur.

CONCLUSION.

It would appear probable that in a future war many of the wounds produced by the new projectile will be surgically treatable and prove amenable to effective surgical treatment. Probably also the number of severe injuries will be very great when we consider the enormous range of the new weapon and the penetrating power of the projectile, which enables it to traverse the bodies of two or three individuals in line, including bones, and to inflict serious or fatal wounds at a distance of 3,000 or 4,000 yards. It is impossible to say what the proportion between these two is likely to be. At near ranges the explosive effects will be much the same as before, but at long range the narrow bullet track, the small external wounds, which often approach the subcutaneous in character, and the moderate degree of comminution and fissuring of the bone will be surgically advantageous. These will form the bulk of the gunshot injuries of the future for it would seem impossible with magazine quick-firing rifles to maintain a contest at close quarters without speedy mutual annihilation.

We may take it for granted that the number of wounded in proportion to the numbers engaged and actually under fire will be greater than before. The supply of ammunition will be larger, the facility for its discharge greater, and smokeless powder will increase accuracy of aim.

I think we are justified in believing, although there is high authority for a contrary opinion, that the next great war will be more destructive to human life, "bloodier," in fact than any of its predecessors, and that the number of injuries and in many cases the severity of the injury, will be largely increased. But very many cases will remain less severe in character, more capable of successful treatment, and less

likely to entail future disablement, while improved sanitation and antiseptic methods will enormously increase the proportion of recoveries.

It is the unceasing effort of modern surgery to provide antiseptic protection in an effective form in time of war; and I may be permitted to recall that the medical organisation during our last war in Egypt was so complete in this respect that not a single case of infective wound disease occurred during the whole campaign.

As a temporary dressing some form of antiseptic occlusion will prove most generally applicable. The small wounds of entrance and exit render this plan comparatively easy of application, and the chances of septic infection will be diminished by the less frequent necessity for probing or searching for a lodged projectile, and indeed the ascertained presence of the bullet is no sufficient indication *per se* to attempt its removal. The eye rather than the hand is the best thing to employ at a first dressing station, as Fischer has well said.

If only asepticity can be ensured—and this is the great difficulty—we may expect a large measure of success to follow the treatment of wounds of the soft parts, many forms of fracture—notably also wounds of the joints, and very especially wounds of the lung.

AN ADDRESS

DELIVERED AT THE OPENING OF

THE SECTION OF OBSTETRIC MEDICINE AND GYNÆCOLOGY.

At the Annual Meeting of the British Medical Association at London, July-August, 1895.

By SIR WILLIAM O. PRIESTLEY, M.D., LL.D., ETC.

ON OVER-OPERATING IN GYNÆCOLOGY.

In opening the Section of Obstetric Medicine and Gynecology it may be appropriate that I should say a few words as to the present position of this important department of medical science and art. Thanks to many workers, the progress has been so great as almost to merit the appellation of the word marvellous. To take the single subject of the application of the antiseptic system to midwifery: the gain has been enormous, and I know no instance within recent days where the triumph of preventive medicine has been so signally marked. The advantages gained have not only been to the public in the saving of precious lives, but also to the profession by enhancing the esteem in which it must be held as a benefactor of the species and in lessening the anxiety and consequent wear and tear of professional life. The benefit to the public and the profession thus go hand in hand.

It is well known that as the result of antiseptics puerperal fever has been practically annihilated in lying-in hospitals. I took the trouble during the International Congress of Hygiene to collect the statistics of all the lying-in hospitals at that time accessible, and I was able to show that, as before the introduction of antiseptics, according to the figures of Le Fort, the deaths were then more than 34 per 1,000, they have been reduced since their careful employment to fewer than 5 per 1,000. In other words, there has been an actual saving of more than 3,000 maternal lives which would otherwise have been sacrificed.

This is no mean achievement for a comparatively short time, which is within the memory of most of us, and the statement by no means exhausts the advantages gained, for the lessened morbidity as contradistinguished from the mortality represents not only so much anxiety saved to the medical attendant and to the friends, but also a shorter convalescence for patients, a less chance of being crippled in the future, and a more speedy resumption of life's important duties.

While the great advance has been made, however, in public institutions, I regret to say that progress of a like kind has not taken place in private practice. The later researches of Dr. Bozall have made it clear that there is a large prevent-

able mortality among puerperal patients attended at their own homes, and, if this continues, it may become a standing reproach to us that women delivered in lying-in hospitals are actually safer than those confined in their own homes, which at one time was quite the reverse.

In view of this state of things it has been determined to have a discussion in this Section on the precautions to be observed in private midwifery practice, and I am sure you will agree with me that its initiation could not be placed in better hands than Dr. Herman's.

While the improvements arising from the use of antiseptics is, perhaps, the most striking recent gain in the practice of obstetrics, and, in importance, takes its place beside the introduction of anaesthesia in midwifery, it is by no means the only one. We can with great satisfaction look upon other advances in our art. One of the most notable is the improvement in the structure of forceps, more particularly the axis-traction forceps of M. Tarnier. The invention of this instrument marked a new era in obstetric practice. It has produced a precision in its application, which, while affording greater security to the mother and child, tends also to extend the sphere of its usefulness, and thus lessens the necessity for operations which imperil maternal or infantile lives—perhaps both.

Modifications of instruments used for craniotomy and other like operations have made them, when actually necessary, easier in performance and safer for the mother, while the general adoption of antiseptics has greatly widened the field for such proceedings as Caesarean section, Porro's operation, and symphysiotomy, in cases of extreme deformity.

But it is in the department of so-called gynecology that in later days the greatest activity is to be noted. A more exact knowledge of the pathological changes which take place in the pelvic organs—the results of experience as to the tolerance of the peritoneum if not tainted by infective organisms—the help of anaesthesia, asepsis, and antiseptics, have brought about a revolution in the treatment of the surgical diseases of women, and greatly multiplied the number of possible operations. I can recollect a time when tapping was regarded as the only legitimate operation for ovarian tumours, and as this was only palliative, and available exclusively for cysts containing fluid, the life of the woman, after the disease was established, was computed as worth at most but a few years' purchase from an actuarial point of view. In those days a great surgeon expressed the opinion that he who attempted the entire removal of an ovarian tumour ought to be indicted for manslaughter! Now, thanks to the introduction of anaesthetics and the careful observance of aseptic or antiseptic precautions, ovariectomy is not only sanctioned by the most conservative of minds, but it has had a success in many hands which evokes unqualified admiration. To hear of seventy or more cases in the hands of one operator without a single death, and results almost equally favourable with others, seems to have been enough to persuade some persons that the millennium in this field of operations has arrived, and that henceforth there need be no limits prescribed to exploits in abdominal surgery. Certainly experience has taught much hitherto unsuspected as to what may be accomplished by skilful procedure and scrupulous antiseptic precautions, but the enthusiasm aroused, not without good reason, may readily be carried too far. I have lived long enough to have seen the evil of rushing on too impetuously, and in watching the progress of gynecology during long periods of time, have witnessed the wax and wane of many enthusiasms which have had their day, and have had a share in bringing something like discredit on a department of practice which, rightly exercised, is productive of great good, but, exercised unwisely, is capable of producing infinite harm.

Looking back on forty years of gynecological practice, I can recollect what has been termed a craze for inflammation and ulceration of the os and cervix uteri. During its prevalence it was said of some devotees that every woman of a household was apt to be regarded as suffering from these affections, and locally treated accordingly. Shortly afterwards came a brief and not very creditable period when "clitoridectomy" was strongly advocated as a remedy for numerous ills. This fortunately had a very limited currency, and was speedily abandoned. Then followed a time in which displacement of the uterus held the field, and every backache,

every pelvic discomfort, every general neurosis was attributed to mechanical causes, and most needs be treated by uterine pessaries. Again, we had an epoch when oophorectomy or castration of women was not only recommended and largely practised as a means of restraining hæmorrhage in bleeding fibroids, but also as a remedy for certain forms of neurosis even when the ovaries were healthy or not seriously diseased. How long it was discovered that removing the ovaries for neurosis even if safely accomplished so far as life was concerned, besides unsexing the woman, was frequently followed by more severe nervous paroxysms than those for which it had been used as a remedy; that, in fact, it often entailed a loss of mental equilibrium, and sometimes ended in insanity.

Closely upon this, again, came an ardour for stitching up rents in the cervix uteri following childbirth, rents which were described as producing many hitherto unknown evils, and frequently conducing to the establishment of malignant disease. One votary of this practice boasted of having detected and operated on in a short period no fewer than 300 or 400 cases which he had found in examining 900 women. Surely here was a marked illustration of the *nimia diligentia*. No such experience, so far as I know, has been chronicled by any other author.

Lastly, we have had what has been described as an epidemic of operations for excision of the uterine appendages; and even now, although this operation has but recently come into vogue, I see there is a reaction against its too frequent performance, and a demand in its place for more conservative methods which shall leave these parts of the generative system a chance of still performing their important functions. These reclamations come especially from across the Atlantic, where one of their most sagacious writers characterised the ardour for operations as akin to the excitement of fox hunting, and has implored his brethren in treating diseases of women to recollect that their patients have other organs than those in the pelvis.

In most or all the modes of treatment which I have indicated there is probably some utility, if properly limited and applied in well-selected cases, but the germ of truth has been so obscured by inappropriate use that each one in turn has been pushed aside by fresh innovations.

I suppose it is inevitable that with an army of workers, each component unit anxious to make a mark in his department, a somewhat undue enthusiasm should be engendered; but I believe we should get greater credit with other sections of our profession if that laudable zeal, without which no great results can be achieved, were a little more tempered by discretion and we were to proceed so cautiously that there should be less need to draw back and limit or even abandon methods which at one time were so popular. It seems to me just now that the tendency is to impart a too large surgical element into the treatment of diseases of women and comparatively to neglect their medical side. I am especially anxious to point out that, although a just equilibrium will no doubt be attained as to what is right and proper, so far as operations are concerned, by the usual process of evolution, a too reckless attempt at progress not only impairs the reputation of gynecology, but the experience and recognition of faults must be gained at the expense of much suffering to many patients—patients of the gentler sex, on whom no man with a spark of chivalrous feeling would desire to inflict unnecessary pain. They are absolutely at the mercy of the medical man, and submit in blind faith to what he recommends as the best to be done under the circumstances. It should never for a moment be lost sight of that the profession exists for the good of the public, not the public for the profession. The spirit of true ethics teaches that we must consider first and foremost the welfare of the patient and secondly the credit of surgery. The great field of patients is not a forest or a prairie, where the credit is the greater to him who is the most daring or who brings the largest number of trophies in the way of operations. The records of 1,000 operations have no intrinsic value unless they are accompanied by proof that the operations were absolutely needless, and the fact that recovery took place does not necessarily justify them. The first instinct should be to try if an operation can be avoided, not to seek reasons for performing it. I am sure the main object of those who

devote themselves to surgical work is a desire to do good; but a great temptation exists to build up a reputation by publishing extensive statistics of operations, and, were it unduly yielded to, would really amount to a sort of gambling—only in this case the counters would be the lives and liberties of human beings. We need to be especially on our guard in gynecology, as unfortunately this department of practice affords an excellent field for the charlatan, who may pretend to cure incurable complaints or persuade helpless patients to submit to unnecessary operations, all for large fees. Such proceedings are sure to be exposed in the end, and are repudiated by all right-minded practitioners.

It is an accepted canon of our profession that neither the promptings of ambition nor the desire for rewards should be allowed a preponderating influence in determining the propriety of performing an operation. Nor should the urgent wishes of a patient be allowed to outweigh the counsels of prudence against it. Caution in this respect is the more necessary because there are always discontented women who magnify their sufferings, and some neurotic patients will submit to any martyrdom for the sake of evoking sympathy. They much prefer an active and energetic doctor, however unwise, to one who knows his pathology, and in that knowledge is content quietly to wait. As an extreme example of what neurotic women will endure and even crave for in the way of operation I may mention the case of a woman who suffered several successive amputations, beginning with the finger and ending with the removal of the shoulder joint, for injuries which were self-inflicted.

It may be laid down as an axiom that serious and dangerous ailments justify serious remedies, and that even grave incapacitating complaints like fistula, etc., may claim the active intervention of the surgeon.

Cancer, for instance, is a grave and fatal malady, and may in truth demand capital remedies. On this subject we shall have the advantage of a discussion in this Section raised by so competent an authority as Mr. Knowsley Thornton. Here there is no question likely to be raised of expediency or justification, always supposing there is a reasonable chance of cure, or at least of immunity from return for a considerable time afterwards.

It is quite a different matter to submit poor women to capital operations for small or large uterine fibroids without symptoms, or symptoms not of an urgent character, to open the abdomen for the cure of uterine displacements attended only by discomfort, or to remove the ovaries for indefinite nerve pains or other subjective symptoms. In my opinion such proceedings are absolutely unjustifiable.

In speaking of operations on uterine fibroids I specially guard myself as objecting to those performed on tumours without grave symptoms and which may possibly have been detected by accident. Fibroids are very common, and in the majority of instances no more affect the well being of a woman than the knot in the trunk of a tree affects the tree. Even when large they may produce no more inconvenience than can be borne with average patience. When in the United States I learned that few coloured women are without them. They were described as like the tubers of a potato, bound to shoot out, and the subjects of them generally performed all the duties and functions of life without much hindrance. I am constrained, nevertheless, to say there are exceptions to this general rule. I have heard it affirmed that a uterine fibroid never killed a woman. This may in a sense be true, but nevertheless I have seen poor women so reduced by hæmorrhage or so suffering in other ways from them that in their cases I should look with much less disfavour on any surgical interference which promised relief with even comparative safety.

In weighing the pros and cons of an operation, some general considerations, apt to be lost sight of, should not be overlooked. The pain inflicted at the time of an operation, when anesthesia is employed, may be insignificant, but there is the agony of expectation, and the probable pain and prostration afterwards, while the heart-rending anxiety of a husband or other relations are factors which cannot be left out of account by the conscientious surgeon. Besides, there is the question of expense to a private patient, which may be a serious drain on slender resources, and which ought not to be disregarded by the right-minded medical man. I know it

has been urged that an operation is often the quickest and most economical way of ending an almost otherwise tedious, but this is an argument which may readily be abused, and requires very careful safeguarding. I doubt the ethical morality of performing an operation which may entail the loss of life or permanent mutilation for the mere economy of time or to suit convenience.

The cry for a more conservative feeling in reference to the multiplicity of operations, not only in gynaecology, but also in general surgery, was raised some time ago in France, by the celebrated Verroull, who has recently died. He says: "I have followed with lively interest the attempts at radical cure of uterine tumours, and have convinced myself that certain operations have been performed without being preceded by serious attempts at medical treatment, without absolute necessity, and indeed without sufficient regard for the opportunity of the proceeding. To indifference or discouragement in the matter of chronic ailments of this sort has succeeded a violent access of *prurigo secandi*, a sort of *délire opératoire*, carried so far that one is sure to see one day or other the application to the living subject of every operation which is practicable on the dead body. Thus women are castrated when from the ovaries, which are otherwise healthy, certain nervous disorders arise, while others resect a slice of the oesophagus or a piece of the stomach. Unfortunately women are particularly the victims of this carnage. While one would relieve sterility by a grave operation, another would create it for the convenience of patients by a different proceeding. Oh, the thing is very simple. I expect every day to see in the journals the solemn description of a methodical proceeding for removal of the vulva or of the liver in cases of asthma or jaundice. I am willing to believe that the intentions are the purest, and that the boundless love of humanity is the sole factor of these pioneers of surgery, but I do absolutely refuse to see in this sanguinary debauch the characters of veritable therapeutic progress."

So far as this country is concerned this picture is no doubt overdrawn, but nevertheless we have had even within the last twelve months two hospital scandals arising out of alleged over-operating. In view of this and of the various phases which we have gone through; of the number of methods which have had their day, and then, too, been discarded, a warning note may not be unnecessary. Over-zeal in gynaecology is not so innocuous as the change in the fashions of medicines, frequently introduced, and then left on the hands of the hapless druggist. Operations may end life, or leave the patient crippled so far as some of the highest functions of life are concerned, and if they do not physically injure, they may at least leave her demoralized and mentally worse.

One of the untoward results of spurious attempts at progress is that the announcement of some new proceeding or operation issued before its value is proved is apt to be taken up as the last new thing in science by many imitators, who, unwilling to be left behind, at once adopt it, and use it, perhaps, in most inappropriate cases. Thus I have known the uterine appendages removed for matting together of parts by pelvic cellulitis and peritonitis after delivery, because the patient was too impatient to wait for the slow recovery which would have taken place in due course. In like manner I have heard of the ovaries being removed for chronic metrorrhagia after abortion. Oureting, useful though it be in suitable cases, because it is now in fashion, has been proposed to cure a somewhat copious loss of blood, due to the approach of the climacteric, which after a time disappeared spontaneously. The same treatment has within my experience been recommended for sterility in a young wife recently married, and who had no symptoms beyond her impatience to have children. Something operative must be done, and in lack of indication for anything else, this was proposed in all good faith.

I venture to speak strongly on these matters not because I am reactionary or opposed to real progress in our art; I render all honour to the pioneers of true progress, and every useful and proved innovation will always find in me an ardent supporter. As I now, in some sort from seniority, stand outside the circle of strife, I can calmly survey the whole horizon of work, and feel a desire to assist my *compères* in attaining a judicial standard of what is right to be done,

and what is best left undone, without all those violent fluctuations of opinion which have been before experienced. No progress can be made without a certain amount of imagination, as in other branches of science, and there must be some adventure allowed. I admire the man who when the right occasion arises can act promptly and courageously. It is the undue haste and disregard of consequences in pushing forward which ought to be restrained, and the motto of all should be, *Primo non nocere*—at least do no harm.

And now in conclusion I desire to say a few words on a subject concerning which I may not be in unison with many of the members of the Section, probably not even with some of its officers, but I am sure they will forgive me when I take the entire responsibility upon myself.

The subject I allude to is the tendency in the present day of the obstetric physician to invade the domain of the surgeon in reference to what may be called external operations. In this country at least the departure is comparatively a new one. It may be that I have been brought up in a different and more exclusive school, and that the advance of age makes me unwilling to extend the boundaries of the work formerly allotted to the physician-accoucheur in hospital and private practice, but I must confess I have my doubts whether we are right in throwing aside the old restriction, and whether we shall enhance our position in the profession by doing so. I take it as quite certain that the College of Physicians, which has gradually been putting aside its prejudices and electing some physicians practising midwifery to its highest offices, is likely—covertly at first, and later perhaps more openly—to look askance at the claims for the Fellowship of those of its members whose chief work is avowedly surgical. The obvious suggestion to such members will be, why not seek the Fellowship of the Royal College of Surgeons? And so gradually a divorce may be brought about between midwifery and the Royal College of Physicians. It is true this may be unjust—surgery has been determined by the courts of law to be an important branch of medicine, but this notwithstanding, tradition and prejudice are apt to rule the day.

Whether it is judicious for the obstetric physician to extend his work into the domain of external surgery—other conditions than usage being put aside—time alone can show. It is sure to be contested by surgeons generally, and may lead to less amicable relations with them. No doubt the tendency of the age is to break down all lines of demarcation between the varieties of practice—even between the physician and the general practitioner—but this may not be in the best interests of the profession or for the good of the public. To my mind, however, more important than obliterating the distinctions between the physician and surgeon is the danger that by undertaking extensive surgical work the position of the obstetric physician in the estimation of the public may suffer. Hitherto those who are rich enough among the intelligent public have engaged the services of distinguished physicians-accoucheurs, and have paid them large fees, not only because they were regarded as experts in their art, but also because they regarded them as a class apart, not likely to be tainted by the infective organisms met with in surgical practice nor obliged to attend infectious cases in general practice. It is true the introduction of antiseptics has done much to minimise the dangers occurring in former days, but still the question we shall have to answer—and answer explicitly—is, Are our antiseptic methods a sufficient safeguard against the possible contamination of lying-in patients by one who undertakes extensive surgical work in addition to obstetric practice?

I have been reading a recent contribution on ovariectomy by a careful surgeon, Mr. Malcolm, and I learn from him that notwithstanding all aseptic or antiseptic precautions, one of the chief dangers to the patient is still septic infection, and it was this chiefly which carried off his fatal cases. If this be so, careful as he may be, the medical attendant who goes to a midwifery case, after operating on an inflamed or suppurating ovarian tumour, or its subsequent dressing, or after removing a pyosalpinx, with its sometimes foetid and infective contents, incurs a grave responsibility. Puerperal patients are much more susceptible of septic infection than the ordinary run of surgical patients. With the most careful antiseptic precautions at our command, the obstetrician-accoucheur must always feel a certain anxiety in attending

fresh lying-in cases, if he has a patient suffering from puerperal fever, or if he has recently made an offensive vaginal examination. We all know how the odour clings persistently to the hands, even after washing in antiseptic solutions. These contingencies in practice may be unavoidable, but for the accoucheur deliberately to undertake a large amount of surgical work, with all its complications, is surely still further to add to his responsibilities, and perhaps impair the safety of his obstetric patients. With careful antiseptic precautions there may be a relative safety, but who can say there is absolute safety, more particularly if a busy man has to go hurriedly to a midwifery case after operating on lamours inflamed and suppurating, or after dressing wounds in an unhealthy condition? I take it it would be difficult to assert that our defences are so complete and perfect as to leave no loophole for the insidious enemy to creep in. I know one authority at least, who, in his belief that he could render himself perfectly safe, was unhappy enough to give puerperal fever to three successive patients.

I sometimes wonder what can be the reason why obstetric physicians wish to become surgeons. Knowing as I do the good motives which habitually influence members of our profession, I decline to believe that personal advantages and large emoluments are the sole or even the predominant factors.

I presume one of their chief reasons is the desire to widen their sphere of usefulness. They find operations interesting as a new field for work, while they afford scope for that activity which must find an outlet in some direction. But surely the field of work in obstetric medicine is equally interesting, and it is certainly large enough and wide enough to satisfy the most ambitious. A multiplicity of problems are waiting solution, and I lament the diversion of our efficient men into devious paths which do not belong to them.

I may point out that, although operations bring increased emoluments, a mere facility in operating brings no abiding reputation unless conjoined with prudence and with the pursuit of science, which is equally open to the physician as to the surgeon. Without this conjunction surgery becomes a mere handicraft.

No one would pretend that the work done by Sir James Paget in the operating theatre was likely to enhance his reputation as much as his researches in pathology, nor that the operative work of Sir Joseph Lister distinguished him in anything like the amount that his discoveries in antiseptics have done. The truth is that a mere skilful pair of hands, unless dominated by intellectual capacity and a high sense of responsibility, may become potential of more harm than good.

But it may be asked what solution can be offered for the difficulty suggested. The answer would be, by appointing a gynaecological surgeon in every general hospital, who shall work in conjunction with the obstetric physician; and in all special hospitals for women, have some physicians who do not operate, and who would advise with the surgeons. In this way cases would not be viewed alone from their surgical side, and every patient would have the opportunity of getting medical as well as surgical treatment. By way of showing the incompetence of general surgeons for gynaecological work, graphic pictures have been drawn of their ignorance concerning the anatomy and relations of the pelvic organs in women, it has been said this ignorance was so complete that on one occasion an obstetric physician had to direct the point of a trocar through the vagina to a pelvic abscess, while the surgeon used the force to push it on. This, of course, is a caricature, for whatever may have been the case forty or fifty years ago, it must be conceded that Spencer Wells, Thomas Keith, Knowsley Thornton, Meredith, and others, who have never practised midwifery, are not quite ignorant of the anatomy and pathology of the female generative organs, and excellent work has been done by such general surgeons as Mr. Cripps and others at St. Bartholomew's Hospital, and indeed elsewhere, where such cases are allotted to one of the surgeons. Such men as these, from their familiarity with surgical proceedings, would in truth probably be the best operators, and the field of obstetrics and gynaecology on its medical side, if properly explored, is, as I have said before, wide enough for anybody. There is no lack of competent

gynaecological surgeons now in this country; and in Paris, which I visited recently, I found a line of demarcation between obstetric medicine and operative gynaecology tacitly assumed. Each man, therefore, should take his choice, but not wish to be both physician and surgeon.

I again ask you to pardon me if I have broached a subject in which I may not be in accord with many present. Some may think my views antiquated, but they must admit that they are at least in consonance with tradition; and I venture to think they deserve some consideration, since they are not out of harmony with our present knowledge and the advances of modern science. The question has been a burning one for years, and I have thought this one of the rare occasions when it might be fitly broached. Whether you agree with me or not, you may be assured that in conducting the business of this Section I shall show no partiality for any set of opinions, but shall do my best to obtain for all an impartial hearing.

AN ADDRESS

DELIVERED AT THE OPENING OF

THE SECTION OF PUBLIC MEDICINE.

At the Annual Meeting of the British Medical Association at London, July-August, 1895.

By ERNEST HART, D.O.L.

PUBLIC HEALTH LEGISLATION AND THE NEEDS OF INDIA.

THIS is probably the most representative and influential meeting of medical officers of health that has ever assembled in Great Britain. I appreciate the high honour of presiding over it. Two things add to its importance: first, that it meets, not as an isolated or powerless body, but as an integral part of that British Medical Association which includes practically nearly the whole of the authorised members of the medical profession in these kingdoms, and certainly all its most authoritative and highly-informed members, both in this country and throughout the British dominions and possessions; and, secondly, that thus meeting it will have the power of sending up its final recommendations and decisions to the central executive Council and to the Parliamentary Bills Committee of that Association, and through its machinery of transforming them in due time into the basis of legislative action by bringing them within the sphere of the Government departments, and, if necessary, of securing legislative action. What we do and say here, therefore, will, according to its intrinsic merit, be likely permanently to affect public opinion, and ultimately the municipal and legislative proceedings of the Empire.

THE HEALTHIEST CITY IN THE WORLD.

Let me offer you welcome and congratulation at meeting here in the metropolis of the world at once the greatest and the most healthy of cities. Since last the British Medical Association met here, progress has been made in the science and practice of public health administration and the prevention of disease which has amounted almost to a revolution. There was then no Section of Public Medicine such as that over which I have now the honour to preside, and the public health service throughout the country was almost in its infancy. The results of the good work done and its great effects on the health and happiness, and therefore on the material prosperity of this great community, as of the country at large, are sufficiently shown in the bare fact that the mortality of this city has fallen from 22 per 1,000 to 18, whereas but for improved sanitation, due to the advancing knowledge of the methods and principles of preserving the public health, achieved and demonstrated by the medical profession, it would have risen inevitably in proportion to the increasing density of population to at least 24 per 1,000. The science, art, and practice of public health administration are, I am proud to say, almost wholly British; the other nations of the world have, some with vigour and activity, and others slowly and imperfectly, accepted our demonstrations and followed our practice, but for the most part all of them still lag in the rear of British sanitary legislation and administrative

practice. In that great advance I am happy to be able to affirm—and we may all take pride and gather encouragement from the fact—that a main part has been played by the British Medical Association, its committees and its members.

THE CONCEPTION OF OUR SANITARY LAW.

The first great conception of the existing sanitary law was due to our much lamented member, Rumsey, of Chichester, a general practitioner of the highest order of administrative genius, who laid down principles and methods, which were partly, but by no means perfectly, brought into play by the Public Health Act of 1875. To him and to a small active band of far-seeing workers, prominent amongst whom were Sir Henry Acland, Dr. William Farr, and Mr. W. H. Michael, Q.C., and with whom I had the honour of being an active co-worker, was wholly due that great report of the Royal Sanitary Commission, which laid down the basis and prescribed the methods of the legislation which has proved so beneficial and life-saving to the millions of this country. If it be true, as it is true, that by the effects of that legislation every man in this country enjoys two and a-half years' more of active healthy life than he could have anticipated thirty years ago, and every woman three and a half years, the debt of gratitude for this great boon is mainly due to the men whose names I have mentioned. Alas, only Acland and myself survive out of this devoted band, to watch and to rejoice over the results achieved and the progress still in course. Rumsey, Farr, Michael, Stewart have gone over to the majority, undistinguished and unhonoured by their country, and without any of those marks of distinction from the Crown which would undoubtedly have fallen to their lot had the destruction of life in lieu of the saving of life been their occupation. Yet I venture to hope that some day their names may be distinguished in the roll of honour—comparatively barred although such posthumous honour may be—and at any rate in our memory and in the records of the profession they will always hold a high place among the benefactors of mankind, among the great worthies of our age. For theirs was good and great work, nobly and well done, for the pure love of mankind, in utter disinterestedness and often to their great loss. Perhaps I alone, who worked day by day alongside of them, can tell how incessant was their labour, how little it was known or regarded, how frequent their baffling disappointments, and how readily they gave way to the statesmen and legislators who finally took up their work and assumed its public sponsorship.

THE BLUNDERS OF MR. STANSFELD.

The Public Health Acts, to which were attached the names of Mr. Stansfeld, of Mr. Selater-Booth, of Mr. Dodson, and Mr. Gathorne Hardy, are very largely only the public formal expression and outcome of our work. It is only true to add that so far as our ideals and perfected schemes were departed from, health legislation and our present sanitary system have been maimed and are rendered imperfect. To mention only one instance, our system, carefully drawn in all its details, included the creation of large sanitary areas, whose boundaries should be established with a due relation to the watershed, the creation of boards corresponding to the existing county councils for joint combined sanitary administration, and the appointment in these areas of medical officers of health over adequate areas to have the sole duty of sanitation, fairly paid, free from the temptations and distractions of private medical practice, and having fixity of tenure. Mr. Stansfeld in his Bill recognised these principles, but acted upon them only in a maimed and incomplete manner, actuated by the doctrinaire spirit which has so largely interfered with his usefulness as a statesman throughout his career. He insisted on making these arrangements depend upon the intelligence, the generosity, and the far-seeing spirit of an infinite number of small local bodies. It was in vain that as Chairman of the Parliamentary Bills Committee of our Association I urged upon him with incessant and obtrusive energy the necessity of making these broad general principles compulsory instead of voluntary. To all remonstrances he answered that "you must trust the people," that his "Bill was intended to be educational and not coercive," and "the authorities must learn by their errors as well as by their

achievements." "Besides," he pointed out, "you must read between the lines of my Bill. I am offering them all a bribe to do the right thing, and this they will readily accept. We offer to pay one-half of the salaries of the medical officers." I am sorry to say that he was quite obdurate under the sharpness of my remonstrances, and I fear finally the somewhat contemptuous tones in which they were sometimes couched led to a personal coolness which subsequent differences of opinion did not mend.

MR. RITCHIE'S COUNTY COUNCIL BILL.

Mr. Ritchie's County Councils Bill did something to repair the blunders of Mr. Stansfeld, but omitted to appoint medical officers to make the work of the county councils effective. We had recourse to the good offices of Mr. Stansfeld to introduce provision for county medical officers which we understood that the Government would be quite willing to accept; but here again Mr. Stansfeld's doctrinaire views intervened, and I was unable to induce him to word the amending clause so as to make such appointments compulsory. Thus this Bill also was maimed in its usefulness. Only a few of the English county councils have appointed medical officers to assist them in their duties and, notwithstanding the conspicuous usefulness of the work of such men as Mr. Shirley Murphy, Dr. Reid, Dr. Whitelegge, and their colleagues, these most important appointments have only been made in a few cases. Happily I was more successful in dealing with the County Councils Act of Scotland. There, with the help of Dr. Farquharson, Sir Charles Cameron, and co-operating with the Scottish Medical Officers Association, we were able to obtain a compulsory clause, and every county in Scotland now has a county medical officer. It is universally recognised that this arrangement is conferring untold benefits upon the sister kingdom. In many other respects, and especially in relation to a combination of sanitary districts, the provision of adequately paid and skilled medical officers over adequate areas, much still remains to be done to complete and carry out the health arrangements of this country as we originally devised them.

THE RELATION OF HEALTH TO WATER SUPPLIES.

The few further words which I have the duty to address to you as utterances from this chair must necessarily be limited to one or two selected subjects from the wide range over which our programme will extend. You will not be surprised if I deal especially with the subject which has so largely occupied my attention for the last thirty years—that of the relation of preventable disease to our water supplies; and if, coming as I do fresh from a study of the health conditions of India, I lay some stress upon the sanitary needs of that great empire, and some of the means of dealing with the most pressing of those requirements. It is now exactly thirty years since I succeeded in demonstrating, to the satisfaction of all authorised sanitarians, that the cause of the great epidemic of cholera of 1866 in the East End of London was the temporary breaking down of a single pump in the works of the East London Water Company and the temporary disuse of one filter bed. This breakdown led to the distribution throughout the East End of London of water from the river Lee, which had been for a few days polluted by the discharge from the sewers of the house of a family suffering from relaxing cholera, brought from Egypt to this country. That one strange concurrence of river pollution and inadequate filtering, produced, within a few weeks and within a limited area 16,000 cases of cholera and 6,000 deaths. It cost no small trouble to prove indubitably the striking series of facts which were necessary to establish this conclusion on an unassailable basis of evidence. From that time forward however I have spared no pains or expenditure necessary to track the various epidemics of cholera throughout the world due to sewage-tainted water.

CHOLERA A PURELY WATERBORNE DISEASE.

Thus in 1883 I traced the cholera epidemics of Toulon and Marseilles to the prelatinal state of the water supply, a cause which was not then widely accepted, but has now been so, so that Dr. Brouardel, one of our most distinguished converts, has acknowledged that the outbreak of cholera in Marseilles in October, 1892, was principally due to contamination of the drinking water by sewage. The same cause is now

acknowledged by M. Monod, by Dr. Shakespeare, and by Dr. Fronst to have been operative in the widespread epidemics in Finistère in 1885 and 1886. The sudden outbreak of cholera in Paris in 1892 was undoubtedly due to the consumption of Seine water. Happily the French have now recognised this lesson, and Paris has a water supply which is mainly independent of the Seine, so that no future cholera epidemic is likely to occur there. I have already written the history of the great cholera outbreak at Naples in 1884, and at Genoa in the same year. By a telegram to Bertani warning him to investigate the pollution of the water supplied by the Nicolay aqueduct I was able to stop that epidemic.

In the excellent description of the Spanish outbreaks of cholera in 1883 by Mr. George Higin, the dependence of cholera outbreaks and of the enormous mortalities attending them in that year upon sewage-tainted water was most conclusively proved. The outbreaks in Russia in 1892, and of the cholera in Hamburg in the same year owned no other cause and Koch has fully recognised this, so that the improved water supply that Hamburg now enjoys may be counted upon as rendering it immune from future cholera outbreaks. I ventured to predict during 1892 that, however often cholera should be landed in this country, it could never become epidemic, owing to the improvements in our water supply, but that it must be limited to sporadic outbreaks in towns, ports, and rural districts into which it might be imported, and where the water supply is impure or inadequately protected. This prediction was verified to the letter. I by no means claim the exclusive credit of having preached and proved the doctrine that cholera is a waterborne disease, due to the tainting of our water supplies with sewage; that doctrine was first laid down by Snow, of whom I was the convinced apostle. It was illustrated by Snow with all his wealth of quaint eloquence, but even until a late date it was doubted and denied by some of the most eminent authorities, and the official utterances of the College of Physicians at no distant date were to the effect that it was not probable that in the case of cholera the influence of water would ever be shown to consist in its serving as a vehicle for the poison generated in the bodies of those who had suffered from the disease. So late as 1868, immediately prior to my assuming the editorship of the *BRITISH MEDICAL JOURNAL*, that journal declared that "we do not believe a single case on record either proves or justifies the fact that cholera poison has passed bodily as such through water into a man's stomach, and then and there produced cholera in him." The theory that cholera is wholly, essentially, and universally a waterborne disease is wholly mine; and if it is, as I believe it to be, now universally accepted, I venture to say that this acceptance is due to the laborious persistence with which I have accumulated the proofs of it from every part of the world, and have repeated them in my addresses to the profession on this subject, in America, in India, as well as in this country. That doctrine is now becoming a commonplace in Europe at least; although, as I shall presently have to state, it is still ignorantly resisted in India, to the great peril and sacrifice of hundreds of thousands of lives of our fellow-subjects. But even in England our water supplies are still in too many places scandalously and dangerously tainted, and the result is shown in that prevalence of typhoid which is, as I contend, not less surely and inevitably traceable to a polluted water supply than is cholera itself. All that has been done and is being done to ward off cholera is in like measure operative in my view of the facts to prevent typhoid.

WATERBORNE TYPHOID.

In the reports on waterborne typhoid which I am now publishing in the *BRITISH MEDICAL JOURNAL*, I have investigated the data in respect to 208 distinct outbreaks of typhoid fever in this country, from 1871 to 1890, and from these reports it will be seen that they are all of them due to neglects of the water supply. In that period upwards of a hundred millions have been spent in improving our water supplies, and with this result: that whereas the mean annual death-rate per million living from these two diseases was, as stated by Dr. Thomas Thomson, 167 in the five years 1860-73, it was only 179 in the five years 1888-92, so that during the year 1892 alone no fewer than 14,122 persons escaped death from such fever who would have died if they had been living under the régime of

1860. Over a million lives have been saved during the period in question by the improvement mainly of our water supplies. To take a few examples only: At Merthyr Tydfil the annual death rate from enteric fever, which was 24 per 1000 prior to the improvement of its water supply, fell afterwards to 4. At Croxden the fall from the same cause was from 15 to 3, at Ely from 10 to 4, at Penrith from 10 to 4, and at Stratford from 12 to 4. To what an enormous extent neglect still prevails my report, to which I venture to refer you, gives abundant and astounding evidence, and it is still further emphasised by the continued prevalence of typhoid fever in this country, which, however diminished, is still disgraceful and discreditable to our sanitary authorities. London itself is continually in danger, and will remain so, so long as we continue to draw our water supplies from the Thames, which is subject to enormous and dangerous, though variable, pollution with sewage. No sewage-tainted water can ever be employed with safety for the supply of any community, great or small, although of course the variability of the extent and the specific character of the pollution lead, together with seasonal influences and changes of temperature, to fluctuation in the number of typhoid poisonings which the water effects. Every case of typhoid is, in fact, a violent death, an example of water poisoning, and should be the subject of sanitary inquest.

INDIAN SANITARY NEEDS.

If we turn to India, that great empire in respect to which we have such immense imperial responsibilities, the case is still stronger, and naturally the needs are far greater. Unhappily there has been and there is still the most ignorant and monstrous opposition to the diffusion of our modern knowledge on this matter, and to its application to Indian sanitation. A stolid resistance—to use the appropriate words of Mr. Macnamara—of the water theory of cholera was long offered by those in authority. Surgeon General Cunningham, Sanitary Commissioner to the Government of India, in his report for 1872, said: "That it would be a gross exaggeration, as it would be pure assumption, to affirm that the troops and other communities who were attacked suffered because they drank water which had been contaminated with cholera discharges." And again: "The belief in the dissemination of cholera through water is founded on bare assertions altogether unsubstantiated by details—bare assertions such as would not be received by any judicial court, even in the remotest case that could be brought before it." Unhappily certain views of this obstinate and tyrannical "Sanitary Commissioner" who enjoyed a long lease of official power have swayed official opinion.

STOLID RESISTANCE AND ANTIQUATED PREPOSSITIONS.

Unhappily "stolid resistance" and antiquated prepossessions such as this are far more seriously important in India than they are or ever could be here; for under the system of medical organisation which exists in India, one man in high place, such as Surgeon-General Cunningham, may dominate and intimidate the whole system. Indian sanitation is not a scientific but an official system. There does not exist there any independent medical opinion. All are in the employ and under the thumb of official authority. The oldest men in the service are the highest in official position. Their ignorance is often the standard by which their juniors are bound, their prejudices become a despotism and their follies a tyranny. It was for a long series of years as much as a man's promotion was worth to dare to avow the opinion that cholera was a waterborne disease, and that it was carried from place to place along the lines of human communication. The idea that it was spread and diffused by great concourses of people becoming infected by the sewage-tainted water of religious festivals was treated as not only a folly, but an offence. The two things may be concurrent, said an eminent official wiseacre, but it is a wild absurdity to treat them as cause and effect. Unhappily this gentleman still holds high office at an advanced age.

A DISGRACEFUL PUBLIC DOCUMENT.

And so it is that until lately Indian medical officers who dared to accept the patent facts and to aver that particular outbreaks of cholera, of typhoid fever, and of dysentery, were due to contamination of the drinking water, were subject to persecution. Medical officers of all grades were expected to

show respect to their seniors by invoking as the efficient causes of cholera outbreak, telluric influences, pandemic waves, epidemic constitution, cholera mists, blue clouds, cholera blasts, the influence of trees, and such like bogles. Nor is this influence yet extinct. Shameful to say, the Army Medical Regulations for the management of cholera are still produced and republished under the same death-dealing and ignorant superstition. All the most potent facts of our knowledge concerning cholera are still ignored, and in that scandalous public document, which is still supposed to be the handbook of our medical officers, cholera is treated as a contagious and mysterious disease, of which the origin is unknown, of which the very advent is to be the signal for panic and scare. On the appearance of cholera the hospital or the barrack is to be evacuated, troops are to be marched away to a distant cantonment, at right angles to the wind, they are to be collected together and amused by games and entertainments, daily reports are to be telegraphed hither and thither to distant high officials, while the most obvious precautions as to boiling the water, quarantining and examining the native servants, the cooks, and the food supplies, are omitted altogether or only cursorily alluded to. I cannot weary your patience by criticising in detail this most disgraceful document, but I may in passing appeal to the heads of the Indian Medical Service and of the Army Medical Service here to withdraw so discreditable a document, and one so dangerous, not only by its direct teaching but by its indirect influence.

APPALLING AND ILL-DIGESTED REPORTS.

I am ashamed to say that until my recent visit to India I was so repelled by the appalling mass and ill-digested and uninformative arrangement of the sanitary reports of the Commissioner to the Government of India and of the Indian and British Army Medical Service, that I could never even bring myself to read them, and I doubt whether anyone in this country has read them, with any care or attention. Their arrangement alone is a very height of absurdity. They are so artificially divided, and so ill arranged, that it is almost impossible to trace the sanitary history of any body of troops or of any regiment, and when one comes to read the comments and reports upon them of the sanitary officers of provinces, or of army medical officers, one can read in every line intense discouragement, a mere weary compliance with the duty of filling in innumerable foolish returns, and a disgust with a system which has apparently been dictated in the pure spirit of what may be called book keeping, and without any knowledge or regard to the needs of sanitary science and practice. The last vast and bulky Blue Book issued by Surgeon-General Rice, who has just vacated the office of Sanitary Commissioner to the Governor-General of India, is a good example of the costliness, the fatality, and the impotence of the present system. I defy anyone to extract from it any useful information as to the origin, diffusion, and means of extinction of any single epidemic of cholera or typhoid during the year in India. There is no mention of filtration of water or of boiling of water, or of the examination of food supplies, or of anything which one wants to know. There is an utter absence of the scientific spirit, and a still more complete absence of any practical proceedings. I was only, when in India, able to find evidence of the adequate investigation, and of adequate means of extinction, of any single cholera or typhoid outbreak amongst the troops in three reports, and they were all the reports of one man—Professor Hankin, of Agra. In each case they distinctly showed the outbreak of typhoid or of cholera, at Lucknow, Cawnpore, and Agra respectively, to be due to infected water, to milk poisoned by infected water, or to infected food supplies, and they pointed conclusively to the simple and easy means of extinction. One looks in vain in the vast Blue Book of Dr. Rice for any such intelligent appreciation of the causation of cholera and of typhoid, and in his comments that highly placed and distinguished officer passes over the work of the investigation of Professor Hankin with a cursory, depreciating, and misleading allusion to it. There is in the whole of India, with the single exception of Professor Hankin's laboratory at Agra and of the municipal laboratory of Dr. Simpson at Calcutta, no provision for that bacteriological study which is now the first element in sanitary efficiency. In the whole of the Bombay, Madras,

and Burmah presidencies there is no skilled water examiner and no bacteriological laboratory. This seems incredible, but it is literally true.

THE DISCOURAGEMENT OF SANITARY STUDIES BY THE GOVERNMENT OF INDIA.

Medical officers are not even allowed microscopes, and if when they supply them at their own cost they apply for the necessary and inexpensive stains and other minor apparatus necessary for their efficient use they are told that these are no part of a medical officer's equipment or duty. The sanitary commissioners and assistant commissioners of India are for the most part army medical officers who have had no special training, who are liable to frequent removal and diversion to other duties, and the sanitary officers of great districts are habitually overloaded with an immense category of duties which would make it impossible for them to fulfil their duties of health officers even if they were angels from heaven, and even if they were not subordinate to superior officers, who, in their ignorance, scoff at modern scientific science and methods, and to secretaries and other officials who not uncommonly write to them imploring them not to suggest anything new, to keep their reports as short as possible, to avoid complaining, and by no means to suggest anything which will involve expense. I met with half a dozen such instances.

THE OVERLOADING WITH INCONSISTENT DUTIES.

I will quote only one typical case, of which I might give you a dozen, of a gentleman whose first duty was that of sanitary officer over a district with a million inhabitants; who was forbidden to leave his station for more than seventy-two hours at a time; who was in charge of a gaol with about 500 prisoners always under his care, of a large civil hospital, with some 300 to 2,000 operations in the year—far more than would fall to the lot of a surgeon at St. Bartholomew's or any of our great hospitals; who had further the personal superintendence of the whole vaccination system of this vast province of a million and a-half of persons; on whom was laid, in addition, the duty of the annual performance of 200 to 300 post-mortems, the superintendence of a great lunatic asylum with its subsidiary workshops, trades, and occupations, the management of a medical school, the service of a body of police and also of a large staff of railway men. Astounding and ludicrous as it is, that is not an uncommon case. What wonder then that the water supplies of India are such that upwards of a million and a-quarter of deaths occur there annually from malarial infection—chiefly waterborne—nearly three-quarters of a million of deaths from cholera—wholly waterborne—and that our European troops are decimated by typhoid fever wholly waterborne. In respect to this latter, Professor Hankin has shown that a most recent and serious outbreak of typhoid fever among the British troops of India was directly due to the infection of the water supply, and that that infection was largely due to the badness of the filters in use in our barracks, so that filters themselves became the chief source of infection.

THE WORST FILTERS IN THE WORLD.

For of course, as might be expected under such a system, the filters in use in the Indian army and the Indian gaols are the worst in the world, and as bad as human ingenuity could devise. In the French army, where local water supplies are often bad and where typhoid till lately severely raged, its incidence has been almost wholly destroyed, and the army kept free from typhoid by the use of the Pasteur filters. I am not without hope that the use of that simple means may in time come to the knowledge of our Indian army and Civil Service medical chiefs. I was told by several officers whom I met at the Army Medical dinner recently, that they had more than once applied to the authorities, home and Indian, and indented for this simple protection of the life of the troops, but hitherto ineffectually.

THE MUCH-NEEDED RECASTING OF THE INDIAN MEDICAL SERVICES.

The fact is that the whole system of the sanitary service and the civil medical service of India needs recasting. It is

monstrous that it should now form only a part of an ill-constructed military hierarchy in which mere age and seniority and the exigencies of a purely military organisation override, dislocate, and discourage all scientific advance or medical efficiency. The very knowledge of Laveran's bodies, and of the etiology of malaria from waterborne organisms, had filtered into the minds of only a very few when I was last in India, and the notion that the boiling of water or its efficient filtration were the earliest and most peremptorily demanded measures of prevention were in some places scouted and in most looked at askance. Since I have left India I have heard of one or two outbreaks, one quite recently at Bangalore where my policy of the tea kettle, as it was nicknamed, was adopted, and, as I hear with satisfaction, with the result of immediately extinguishing the outbreak. But of course this is only a part of what was necessary, and a temporary doctrine of expediency. The whole of the Indian Medical Service needs to be overhauled and reconstituted. So far as considerations of policy permit, the system of loaning army medical officers temporarily and untruly calling them a civil medical service should be discontinued, or at least most seriously modified. This has been demanded on other grounds for a long period by eminent Indian administrators; it has become now a most urgent necessity. There is no civil medical service in India; it is a military service disguised and called civil to hide its defects.

APPEAL FOR A ROYAL COMMISSION.

Two things struck me in India—the remarkable ability, the enormous power of work, and the excessive overwork of the Indian medical officers, the terrible servitude which enforces on them the attempt to perform a vast mass of duties which cannot be performed, and the lamentable results of the domination of really able young officers by superiors who have risen by mere seniority to positions which scientifically and administratively they are quite incapable of fulfilling, by reason of their age and of the antiquated state of their information, if even many of them had ever possessed at any time the qualities or the inclination necessary for such posts. Worst of all, perhaps, is the elevation to the very highest offices, by mere lapse of time and military rules of promotion, of men who are at most capable of fulfilling routine duties, but are wholly unfitted to be trusted with the administration of the health and lives of the vast population depending on us in India. What is urgently needed is a Royal Commission, or strong Departmental Committee, to inquire into this whole matter, and to institute a radical change. For at present India is decimated by preventable diseases; the health of our troops is ruined by the same causes. With us lies the reproach of nursing and fostering cholera in what is called its endemic home—a purely ignorant and silly phrase. Until some great change is made in the whole system and of the administration, the great sanitary needs of India will never be met. You will pardon me for occupying you with a subject which may seem to be in part foreign to our immediate work, but which is of vast moment to the health of a great population in our Indian dominions.

PATHOLOGICAL MUSEUM.

The temporary Museum of Pathological Specimens collected together in connection with this year's meeting of the British Medical Association has been formed to illustrate points of general pathological interest, preference being given to recent advances in medicine and surgery, to which have been added a few specimens of extreme rarity. The collection, while not pretending to be representative of all branches of pathology, is yet in the particular branches which it does deal with, perhaps the most complete that has yet been brought together. Some of the series exhibited are unique in their completeness, and too great credit cannot be given to Mr. Edgar Willett for the able way in which he has managed to collect together so many rare and interesting series. The specimens have been collected from a very large number of hospitals and museums, who deserve warm thanks for their kindness.

Some of the most interesting exhibits in the department of morbid anatomy are:

A series exhibiting the results of operations in the small intestine, Nos. 28 to 31. Among the more specially interesting of this series, as perhaps throwing some light on the cause of failure in the recently introduced operation of suture by Murphy's button is No. 79, a portion of the small intestine in which is impacted a button. The walls are thickened, and the mucous membrane shows two or three linear ulcers, possibly caused by a rasping or tearing action of the button during its passage.

Series (c), Results of operations on the vermiform appendix. No. 91 is an interesting specimen, being a concretion from the extremity of which protrudes a pin nearly an inch long. It was removed by operation from the vermiform appendix of a patient 24 years of age, who made a good recovery.

Series 2, illustrating gall stones, with especial reference to their escape into the intestine, and the morbid conditions of the gall bladder, is too long to notice in full. The most remarkable specimens are No. 139, a very large gall stone weighing 1½ oz., and measuring 4½ inches in circumference, which was removed by operation from the lower part of the ileum of a woman, aged 56, who made a good recovery; and No. 145, four gall stones, which, when articulated, measure 6½ inches and weigh nearly 2½ oz., from a man, aged 65, who had suffered from obscure intestinal symptoms for two years, and who had been seriously ill only for six weeks. The three portions were found in two large pouches of the duodenum into which they had ulcerated from the gall bladder.

Series 5, illustrating syphilitic diseases of joints, is perhaps one of the most interesting of all the series exhibited, and description can give no adequate idea of the appearance of these rare affections.

The same remark applies to Series 8, illustrating actinomycosis and Madura foot.

In the series illustrating leprosy, Nos. 322 to 328 are remarkable, showing a possible gradation from albinism to leprosy, at least as regards their external appearance.

Series 10 is a very unique series of rare tuberculous affections, among which Nos. 273 *et seq.*, illustrating tuberculous ulcers of the tongue, are perhaps the most valuable.

Series 13 comprises all the specimens of infantile scurvy that are at present in London; they are extremely rare, and another opportunity may not occur of their being studied simultaneously and comparatively.

A most curious series is No. 14, illustrating senile depression in the parietal bones, the phenomena of which have hitherto been unexplained, all explanations that have hitherto been offered having been upset by the occurrence of the same thing in the skull of an orang.

Amongst the rare exhibits is No. 431, the famous specimen of a renal calculus from St. Bartholomew's Hospital Museum, and No. 437, of transverse hermaphroditism from the same source.

The fifteen cards and the five coloured sketches exhibited by Dr. Savill illustrate an epidemic skin disease which prevailed in London in 1891. The malady arose chiefly in the workhouse infirmaries in the metropolis, though it was not confined to them. Altogether 424 cases arose in six institutions (infirmaries and lunatic asylums), besides sporadic cases, during that year. The thirty-seven photographs and five coloured sketches shown are some of the 163 cases which occurred in the Paddington Infirmary and Workhouse, under the care of Dr. T. D. Savill, from whose negatives these platinotypes have been taken and presented to the Hunterian Museum. The photos are arranged in order to illustrate the successive stages of the disorder. The affection is fully described in Dr. Savill's monograph, a copy of which is in the library of the College of Surgeons of England. The eruption starts usually with discrete papules, often in stellate groups, and generally arranged symmetrically when on the limbs. These groups become fused into crimson slightly raised macules, which, in severe cases, become further fused into red thickened patches, in which papules can still be felt and sometimes seen. Vesicles form and exudation occurs only in about one-third of the cases. Desquamation of the epidermis is the invariable feature of all cases, and it usually commences between the fourth and eighth days. In severe cases successive layers of the epidermis are shed in larger or smaller scales, throughout the whole course of the malady.

In the Bacteriological Section, Dr. Cantley's exhibit con-

state of cultures and coverglass preparations of an organism found in seven out of eight cases of the affection usually termed influenza cold. It is of special interest and importance as showing, first, that the disease in question is microbial in origin, thus explaining the frequency with which such colds affect all the members of a household; secondly, that it possesses a certain relationship to epidemic influenza. The biological characteristics indicate that the organism is allied to the organism of epidemic influenza. Morphologically the organism presents a further point of interest, many club-shaped forms, similar to those of the diphtheria bacillus, appearing in the specimens. Some excellent photographs of the specimens accompany the exhibit, and were taken by Mr. E. O. Bousfield. The organism is well named the bacillus coryzae segmentosus.

The cultivations from the laboratories of the Conjoint Board of the Royal College of Physicians, London, and of the Royal College of Surgeons, England, are permanently fixed by formaldehyde. This substance arrests the growth almost at once, and after the lapse of two or three days kills the bacilli. Various organisms in culture, illustrating this method, show its applicability to museum and other specimens.

The exhibit is designed to illustrate a day's work in the laboratories in connection with the Metropolitan Asylums Board in identifying bacteriologically cases of diphtheria. A series of micro-photos by the different workers in the Board's laboratories is of great beauty, bearing ample testimony to the excellence of the work carried on in these laboratories.

Drs. MacFadyen and Hewlett exhibit from the Bacteriological Department of the British Institute of Preventive Medicine a complete series of cultures of the most important micro-organisms, and Mr. Joseph Lunt of the water laboratory of the same institution exhibits living cultures of various water organisms isolated from drinking water, sewage, air, etc., together with some interesting instances of enzymes filtered from both cultures of various organisms, possessing liquefying and other properties similar to those possessed by the parent organisms.

Of the photographic exhibits, Dr. Klein's was undoubtedly the largest, and in many respects the finest. In it were a large number of photographic lantern slides representing nearly all known pathogenic bacteria, and, amongst others, duplicates of Mr. Bousfield's work for the influenza and cholera reports, the latter especially showing vibrios with their flagella with wonderful clearness. The photographs of tube and plate cultivations by the latter gentleman showed very strikingly the characteristic appearances of the living organisms under cultivation. Mr. Pringle's well-known work too was present in very considerable amount, his photographs of impression preparations of fowl enteritis and proteus vulgaris being especially clear and beautiful, and his photographs of actinomycosis and bovine tubercle being splendid pictures of perfect preparations. It is abundantly clear from this, as from the photographic exhibits in general, that perfect photographs can only be got from perfect preparations, and in view of the share which this method of reproduction is likely to play in the future, we recommend pathologists and bacteriologists to closely inspect this exhibit. We notice that both Mr. Bousfield and Mr. Pringle are represented by photographs of their own preparations, in the former case of thrush fungus, gonorrhoea, etc., and in the latter of the beautiful pictures of giant cells already referred to. Altogether, Dr. Klein is greatly to be congratulated upon his exhibit.

THE SUICIDE EPIDEMIC.—During the last few days notes have appeared in several of the daily papers under the above heading. We think there is no ground for making use of this term. In some conditions suicide spreads as an epidemic, but these are fortunately rare, and are historical curiosities more than anything else. If we look to the authorities on the subject of suicide, we find that in England and in most temperate countries the maximum of suicides are committed in either May, June, and July, and as yet no one has been able to settle why these should be months of greatest danger, but this is a fact, and therefore that an excess of suicides appear just now is only the evidence that this year the maximum is reached in July.

ANNUAL MUSEUM.

[FIRST NOTICE.]

Messrs. ALLEN and HANBURY, LIMITED, occupy spaces immediately to the right and left of the centre space; that to the right is occupied with all their well-known Pharmaceutical Specialities, whilst that on the left hand is an exhibition of all the latest and most approved Surgical Instruments, chiefly of their own manufacture. They had an attractive display of Tabellix. These compressed drugs continue to become more and more popular with the profession and public alike, and Messrs. Allen and Hanbury's products in this line present many better and nouseous remedies in a very tempting form. Malt Extract and its combinations are staple articles of this firm, and it was to the late Mr. John Barry, a former partner, that we owe the adaptation of the vacuum pan to pharmaceutical uses. Amongst a large number of malt preparations, digestive ferments, nutrients, laxatives, etc., was the well-known preparation of malt and the hypophosphites and the alkaloids of cinchona and nuxvomica—Byno-Hypophosphites—which has become one of the most popular tonics of the day. They showed three kinds of Infants' Foods adapted to the age of the child—an original idea. Since the introduction of Nos. 1 and 2 foods have been greatly improved. These are complete foods, containing the correct proportions of human milk, that is, fat, casein, and sugar, etc., the whole series being in the form of powder. Chris-moids are a useful and striking novelty, and consist of boxes of round gelatine capsules about the size of a marble, containing six different kinds of antiseptics, among which are carbolic acid, iodo, boric acid, etc. The idea is that medical men can carry these in the midwifery bag, and before performing gynaecological or midwifery operations have a ready and effective means of sterilising the hands and instruments by simply breaking a capsule and squeezing out the contents. Of the remainder of the exhibits but little remains to be said. There are tall flagons of the "Perfect" Cod-liver Oil and Castor Oil, both specimens of the high-class products; Capsuled medicines in glass and gelatine, Medicated Throat Pastilles, and a host of Fluid Extracts, Fine Chemicals, and other standard products of their laboratory. Allen and Hanbury are the special agents for the Antitoxic Serums made by the British Institute of Preventive Medicine, and show the style of sending out the antidiphtheritic, antitetanic serums, also tuberculin and mallein; the special syringes for use with the same are exhibited in their instrument section. There was also exhibited a new feeding bottle, the "Allenbury" Feeder, which they have introduced to be used with their infants' foods, and which appears to be without the manifold defects of the old fashioned "tube" feeder; it is simply a boat-shaped feeder with a teat, but there is a valve inlet in the bottom of the bottle, so that as fast as the child sucks out food air finds its way into the bottle, which causes an even flow of the food, and the child is consequently free from wind colic and other distressing forms of flatulence brought about by sucking air instead of food into its stomach. It is also most easily cleansed—a most desirable thing in a feeding bottle. The surgical instrument installation of Messrs. Allen and Hanbury contains a large number of newly-introduced instruments and appliances. The old-fashioned midwifery forceps with wooden handles are giving place to the modern metal handled instruments. These present many advantages—strength, lightness; when made of such metal as aluminium they are easily sterilised, and if made with detachable handles no accumulation of veridigra or other septic material can possibly occur, as is sometimes the case where the handles are brazed at the seams. Although greatly improved, these are sold at the prices of ordinary forceps and any pattern supplied. A good idea, too, is embodied in their Midwifery Bag, which has a movable lining; this, being taken out and washed when soiled, is much cheaper and cleaner than having it relined with leather. Amongst the large and assorted stock of Forceps, Scalpels, Amputation Cases, and Sterilisers was noticed Ryall's new Rectal Forceps, recently noticed in the BRITISH MEDICAL JOURNAL; also Mr. Ellis's modification of Sir Spencer Wells's and Lawson Tait's Clamp for the Compression of Uterine Fibroids; a modification of Champetier de Ribes's Bag for the Induction of Premature Labour by the same surgeon.

Amongst apparatus was noticed Sir George Johnson's Picro-Saccharometer, a complete testing cabinet for the estimation of urea and albumen and sugar in urine; some excellent Powder Insufflators and Atomisers, called the "Allenburys's." Messrs. Allen and Hanbury also fitted up Room No. 29, King's College, as a Model Operating Theatre, where, in addition to the operation tables which they have made a leading speciality of, they also exhibit glass instrument cases, dressing waggons, movable washstands, and pedal washstands for using antiseptic solutions of various strengths. In the latter case the operator when washing his hands simply presses the pedal with the foot and the solution flows into the basin; all contact of the hands with taps, etc., is therefore obviated. The operation tables above referred to are made of enamelled iron and fitted with a series of hot water pipes for the circulation of hot water so that the temperature of the patient may be maintained. The surface frame is movable and may be adapted to the Trendelenburg or other positions. They showed also a Light Operating Table of wood, constructed to fold up in a small compass, and suitable for private use; various patterns of Operating Cushion—the pad with india-rubber rim is inserted beneath the patient's buttock in operations on the perineum, to carry off lotions, etc., useful in operations on the loins and trunk; a Consulting-room Couch, designed by Mr. W. H. Marriner, M.B.; a Consulting-room Couch, designed by Dr. J. R. Whitt, which can be converted into a gynecological or surgical couch; Glass Instrument Cabinets with brass frames—the instruments can be seen from all sides and are readily removed, they can be washed down with a hose or with antiseptic solutions; a white Berkefeld Aseptic Irrigator, as used at St. Thomas's Hospital and the London Hospital, were shown in use.

Messrs. ARMOUR AND CO. (Chicago, U.S.A., and London) showed Pare High-testing Digestive Ferments, Extracts of Beef, Peptones, etc. Digestive Ferments: These are prepared in the Armour Laboratory in Chicago. Pepsin (1) Insoluble Powder; (2) Granular; (3) Soluble Powder. Standard strength 1,300 United States Pharmacopoeia guaranteed five times British Pharmacopoeia strength. These pepsins are said to be permanent in strength, odourless, non-hyposcopic, and free from peptone. Glycerole Pepsin: A concentrated Solution of Pepsin in Glycerine; 10 minims represent 1 grain of Armour's Pepsin, or 5 grains of Pepsin B.P. Pancreatic Powder: A concentrated product prepared from fresh material, and containing in an active form all the ferments of the pancreas. Partially soluble in water, and guaranteed to answer the tests of the U.S.P. Glycerole Pancreatin: A concentrated solution of Armour's Pancreatin in Glycerine. Ten minims represents 1 grain of Pancreatin. Lactated Pepsin: A combination of the various digestive ferments in their natural proportions. Pepsin Tablets (3 grains, plain or sugar-coated); In bottles containing 20 or 75 tablets. These consist entirely of Armour's standard pepsin, each tablet being equivalent to 15 grains pepsin B.P. Pepsinising Tablets (in tubes containing 15 tablets); Pancreatin 2½ grains, bicarbonate of sodium 8 grains. A list of recipes supplied for predigesting infants' and invalids' foods. Nutrient Wine of Beef Peptone: A solution of pure peptonised beef in high-class sherry. Each fluid ounce represents 1 ounce of predigested prime lean beef. Essence of Pepsin: A delicately flavoured solution of pepsin of great activity. Decalcified Ox Gall: Prescribed with pepsin in the form of pills. Insipated Ox Gall: 15 volumes equal 100 volumes of fresh ox gall. Decalcified Blood. Beef Peptone Paste: This is prepared by digesting lean beef with the natural digestive ferment, and is one of the constituents of Armour's Nutrient Wine of Beef Peptone. Beef Peptone Powder: The same as the beef peptone paste, but in powdered form. Decalcified Thyroid: Prepared in a sterilised laboratory from fresh, healthy glands, which are carefully dried and degreased. Twelve grains equal one gland. Decalcified Thyroid Tablets: Five grains. In bottles containing 100 tablets; each tablet is equivalent to one-third of an entire healthy gland. Armour's Extract of Beef: A concentrated extract of beef, prepared by a new process, which consists in the reduction of 45 lbs. of prime lean beef to 1 lb. in mass by slow heat. By this process the extract is not burnt, and therefore contains the true life and flavour of prime beef. It is especially suitable for the preparation of

beef tea for invalids, as it is retained by the most delicate stomach. Supplied to H.M. and U.S. army and navy, and to Dr. Nansen, the Arctic explorer. Armour's Vigoral: A combination of Armour's extract of beef and powdered beef fibre, suitably seasoned. Useful for domestic use as a bouillon, and also to all athletes and cyclists.

Messrs. ARNOLD AND SONS (West Smithfield, London) showed life-sized Moulds, fitted with new patent mechanical arm, for amputations above the elbow, below the elbow, and for partial amputation of hands and fingers. These mechanical arms are so constructed that the patient can, without the least difficulty, grasp anything with the hand and release the same at pleasure. The rotation of wrist movement and the grasping and releasing of the fingers is novel, and possesses many advantages over all arms hitherto constructed. Dr. Rain's Improved Vaginal Douche: This is very effective, and should prove a most useful adjunct to the accouchour. Dr. Garrat's new apparatus for exploring and drainage purposes: This is now in general use at St. Bartholomew's Hospital; likewise Dr. Garrat's new form of Syringe for the Antiseptic Treatment. A Compactum Midwifery Set, which will be found very complete, and contains almost every instrument, etc., that is likely to be wanted, in a very small compass. Dr. Ormsby's new form of Hemorrhoidal Clamp. Dr. Macnaughton Jones's new Nasal Guillotine or Turbinotome. Dr. Bowen's Barbadoes Hypodermic Syringe. Mr. Bruce Clarke's Needle Holder and Pressure Forceps combined: this is a very simple and useful instrument. Mr. Ackland's new Adjustable Mouth Gag; the Reliance Binaural Stethoscope. Cases for General Operations: These are shown in a large variety, with aseptic metal handles, metal lined so that the lining may be useful for the purpose of sterilisation, etc.

In addition to their well-known preparations of Milk for Infants and Invalids, the AYLESBURY DAIRY COMPANY exhibited a Laboratory in full working order for the examination (chemical, bacteriological, and microscopical) of Milk, Milk Products, and Water as carried out by their analysts in their chief laboratory in St. Petersburg Place. Judging from the records which are annually published of the work done in, and the researches emanating from, this laboratory, it appears to be a long way in advance of the two or three other laboratories which have been since fitted up by other firms in the same line of business, the work comprising (1) the periodical analyses of the waters used on the various farms supplying the Company with milk; (2) the daily analysis of samples of milk, cream, butter, etc., and (3) the bacteriological examination of all products. No better proof of the reality of the work done by this laboratory can be adduced than the fact that much of the apparatus, and many of the methods used for detecting the adulteration of milk, butter, etc., have been devised or exhaustively studied, proved, and improved by the Company's analytical staff. We noticed several tests which were absolutely new—for instance, the detection of formalin (formaldehyde), the new preservative. After seeing the scientific control employed by the Aylesbury Dairy Company, Limited, the existence of their Humanised Milk is not a matter of surprise; it is made to correspond as nearly as possible in composition with mother's milk. It is a well-known fact that milk is naturally variable in composition, and mother's milk especially so, and the Aylesbury Dairy Company, Limited, have realised this fact, and prepare two qualities of Humanised Milk, one, No. 1, containing a minimum of casein, and suitable for infants of tender years or of delicate digestion, and the other, No. 2, with a full percentage of albuminoids and suitable for the more robust children. Their being perfectly sterilised renders them absolutely safe, and nothing such as water, which may be contaminated, need be added. The Company's other preparations are Special Milk Food for exceptionally delicate infants and invalids, Peptonised Milk, Specially Prepared Whey, and last, not least, Koumiss. All these preparations, with the exception of Koumiss, are supplied in the patent vacuum stoppered bottle. In this bottle the contents are sterilised *in vacuo*, thereby insuring not only a less pronounced scalded taste, but also the complete destruction of all germs.

The ROYAL COMPANY exhibited their Bovel, a fluid beef, containing a high percentage of the nutritious constituents of

prime ox beef in a form easy of digestion and assimilation. Beef Jelly. This preparation is prepared from the finest matured ox beef; it is extracted by gentle heat, without added water, and is guaranteed absolutely pure. Special attention is claimed for this preparation on account of the unique method adopted for packing the jelly. It is put up in hermetically-sealed glass jars, and all injurious contact with metal is thus avoided. Albumen Flakes. This preparation is a desiccated, uncoagulated, albumen of meat. The recent discussions as to the apparent impossibility of furnishing a meat juice without some chemical or antiseptic treatment made the Company turn their attention to the subject, and their experiments have led to this new result. This meat juice is desiccated by special appliances at a low temperature, and may be kept indefinitely in any climate without detriment, and when dissolved in water will possess the precise quality of now expressed juice in an absolutely pure and natural condition. Ordinary meat juices contain 2 per cent. of albumen; these flakes contain 85 per cent. and thus constitute a most nourishing, easily digested invalid's diet. Emergency Foods. These are preparations prepared for any purposes, and contain the maximum amount of substantial nourishment in the minimum bulk. In this class of foods were shown samples of those foods supplied to the Nansen, Jackson, and Wellman Arctic expeditions. Horsford's Acid Phosphate, a preparation manufactured under the direction of Professor E. N. Horsford, of Cambridge, Mass.

Messrs. BRAND AND CO. (11, Little Stanhope Street, Mayfair, W.) showed at their stall their Essences of Beef, of Mutton, and Chicken, which have a sixty years' reputation: Albuminous Essence of Beef, containing the albumen unseparated from the essence, and is of great value as an albuminous preparation; Meat Juice, which is valuable on account of its being extracted by pressure from raw English beef of finest quality, the juice being concentrated *in vacuo*, which produces a strong and nutritious food in liquid form by adding a winglessful of cold water to a teaspoonful of the meat juice; Beef Bouillon and Extractum Carnis. Concentrated Beef-ten, Mutton, and Chicken Broths are preparations which contain the nutritive and stimulative constituents of the choicest meats, and are useful in the sick room; as also their Real Turtle Soup (specially prepared for invalids), Ox Tail, and Mock Turtle. Beef, Mutton, and Chicken Peptones are of the same consistence as the essences above mentioned, after undergoing Messrs. Brand's process of peptonisation. Meat Lozenges are exceedingly valuable to convalescents and travellers, being done up in compact little boxes, handy for carrying in the pocket, and contain the nourishment of highly-concentrated beef tea.

Messrs. BURROUGHS, WELLCOME, AND CO.'s display in the museum of the British Medical Association meeting occupied a most prominent position there, and claimed the immediate attention of the visitor. A careful examination of their effective and interesting display will make the worker in the field of medicine acquainted with many things designed to lighten his labours and strengthen his hands in the never-ceasing conflict against disease and death. In this direction portable Tabloid Medicine Cases and Chests go a very long way. They are of various sizes and capacities, some so small and compact that they can be carried in the pocket without discomfort, others containing a perfect dispensary of drugs as well as compartments for surgical instruments and accessories. Special attention has been paid to the needs of explorers, missionaries, colonists, and travellers generally. We are told that they have equipped every commercial, military, mining, exploring, or other expedition of importance which has left these shores for many years past, including Mr. Stanley's Emin Pasha Relief Expedition. Of the last-named they exhibit an interesting memento in the shape of some of the cases carried by that expedition. They are in a battered condition, but their remaining contents are none the worse for the varying climatic conditions through which they have passed. Tabloids of Compressed Drugs.—It is not needful for us to dilate upon the advantages of tabloids generally. Mention must, however, be made of a few recent additions to the list. The tabloids of organic principles of animal origin have a particular interest at the present time when so much attention is being paid to the treatment of certain diseases by

physiological substances. It is claimed by Messrs. Burroughs, Wellcome, and Co. that since tabloids contain the whole substance of the particular body they must necessarily include all the active principles. A few well-known varieties of tabloids may be mentioned in passing. Hypodermic Tabloids with which accurate and reliable solutions may be made in a moment. A large selection of these occupies a very small space, so that practitioners may carry them about with ease. They are an improvement upon the old-fashioned hypodermic solution. The cases for holding a selection of these, with syringe, needles, etc., are models of compactness and convenience. Ophthalmic Tabloids. These are very tiny discs, extremely thin, and are intended to be inserted within the conjunctiva without being previously made into a solution. They dissolve immediately in the lachrymal secretion, and act most promptly and effectually. Tincture Tabloids are designed to get rid of the uncertain nature, that is, uncertainty as to strength and reliability, of tinctures themselves by eliminating the alcoholic menstruum and compressing the active principles into small space. Soloids are for quickly and promptly making antiseptic solutions for use in surgical and gynaecological practice. They are of a characteristic size and shape, so as to avoid confusion with tabloids, and they dissolve very readily. Soloids of Mercuric Chloride are coloured blue, by that means avoiding mistakes and accidents. The colouring, however, does not stain linen. Soloids of Iodic Hydrarg. (Mercuric Potassio-mercuric Iodide) possess a very high degree of antiseptic strength, and are not nearly so poisonous as the mercuric chloride. The use of iodic hydrarg. as an antiseptic appears to be becoming very general. Photographic Tabloids appeal, not only to the medical profession, but to a much wider circle; at the same time they are likely to be useful when records of specially interesting cases are desired to be kept by means of photographs. Tea Tabloids commend themselves to travellers and tourists more than to any class of the community. Tabloids are always the same in weight and quality, so that the particular strength desired may be regulated and kept uniform with perfect nicety. They also showed Anti-Luptheritic Serum prepared by themselves. They have now, they tell us, a laboratory most completely equipped, and under the charge of a well-known physiologist and bacteriologist. Most elaborate precautions are taken to ensure that the serum is in perfect condition before it is sent out, and the reports of cases treated by it have been very satisfactory and encouraging. The liquid Serum is supplied in bottles of 30 c.c.m. The dried Serum is in laminae or scales, and presents the great advantage of perfect keeping qualities. A tabe contains one gramme, which is equal to 10 c.c.m. of the liquid Serum, and may be administered with less trouble and discomfort to the patient than the ordinary liquid Serum. Haal-Kelst is an impalpable, natural dusting powder. It contains a phenomenal percentage of stearate and a small quantity of ferrous oxide; in other respects its composition is similar to that of superior qualities of fuller's earth. Hazeline (Witch Hazel) preparations are numerous, but they are by no means uniformly valuable. In order to obtain all the valuable and varied medicinal principles, it appears to be essential that the fresh inner bark should be used, and that the process of extracting the active principles should be one of distillation. Hazeline preparations include Hazeline Cream, Hazeline Snow, and Hazeline Compound Hazeline Suppositories. Lanoline is a perfect basis for ointments; first, because it cannot turn rancid; secondly, because it is so readily and completely absorbed by the skin. The various toilet preparations having Lanoline for base include Pomade, Cold Cream, Shaving Cream, Soap, etc. Beef and Iron Wine is excellent for its tonic and stimulant properties, the constituents being readily absorbed by the system. Each table-spoonful contains the essence of an ounce of beef with 2 grains of citrate of iron dissolved in good sound-bodied sherry. The number of Instruments shown by Messrs. Burroughs, Wellcome, and Co. is not large. The Powder Insufflator, unique of its kind, with interchangeable powder cylinders, is neat and handy to a degree. The Nasopharyngeal and Post-nasal Ointment Atomisers are well known, as are Artificial Ear Drums, Chloride of Ammon. (Vereker) Inhalers, Pinol Dry Inhalers and Thermo-safeguard Feeding Bottles. The Patent Aluminium Syringe is neat,

light, but withal strongly made, and is suitable for the hypodermic injection of all substances so administered. It is not affected by change of climate. Wyoth's Beef Juice, for which Messrs. Burroughs, Wellcome, and Co. are now sole agents in Europe, Asia, Africa, and Australia contains the nutritious albuminous qualities of beef in an unaltered and soluble form. It is a most valuable invalid diet, deriving its albuminous principles entirely from beef, and not, as is sometimes the case, from added egg albumen. The Synthetic Products of Moister, Lucina, and Bruning, including Antipyrin, Agathin, Dermatol, Alumnol, Diaphtherin, Loretin, Phenosalyl, Hypnal, Benzozol, are shown. Each of these has its sphere of usefulness, and many have already found high places in the favour of the medical profession. Messrs. Burroughs, Wellcome, and Co. also showed some Silver, Ivory, and Tortoiseshell, and richly ornate Leather Medicine Cases, and also the Silver Hypodermic Cases in which the fittings are held by springs, there being no valves or leather to harbour microbes or septic matter of any kind. The Gold Hypodermic Cases, elaborately chased and fitted throughout with gold instruments, should also be seen.

Messrs. CALLARD AND Co. showed their Bran and Almond Biscuits, Almond Biscuits, Almond Meal Biscuits; these are unsweetened and perfectly free from starch and sugar. Meat Biscuits, Parmesan Cheese Straws; these are free from starch and sugar, well seasoned, and very palatable. Dr. William-Almonat Biscuit; this biscuit is pure and much resembles ordinary oatmeal. Coconut, Almond, Walnut, Hazelnut, Pinenut Biscuits; Almond Shortbreads, Almond Sponge Cakes, Almond Pound Cake, which are perfectly free from starch and sugar, and sweetened with saccharine and glycerine, and make good dessert and afternoon-tea biscuits. Gluten Bread, Dinner Rolls, Cracknels, Lunch, Almond, Cheese, and Finger Biscuits, containing no sugar and only a slight minimum of starch. Callard's Ivory Jelly, which contains phosphates in large quantity, and in an assimilable form. Callard's Callisba Biscuit contains neither butter, sugar, nor starch, and is therefore a good food for reducing weight. Callard's Saccharin Chocolate is a pleasant sweetmeat, and also makes a delicious cup of chocolate. Callard's Cocoa, a special preparation, perfectly pure, and contains no added matter. Gluten, Almond, Soy, Aleuronat, Coconut, and Bran Flour for home use.

THE CEREBOS SALT COMPANY (Newcastle-on-Tyne) showed their Cerebos Salt, an article to be used instead of common salt for all household purposes. In appearance and taste it is like the finest table salt, except that it does not become moist or lumpy. Analysis reveals the presence of mixed phosphates, such as exist in wheaten bran. It is intended by the use of Cerebos instead of common salt to obviate the necessity for dosing children periodically with chemical food, a proceeding rendered necessary at present by the exclusion of the bran from bread, that portion of the grain being much richer in phosphates than the kernel from which white flour is manufactured. The Company are also manufacturers of Baking Powder having the same nutritious properties as the salt.

Messrs. DAINESMAN AND Co. showed lantern slides of Biological Subjects executed from selected microscopical pictures and micro-photographed, thus absolutely true to Nature and a boon to lecturers; engraved life-size diagrams of brain on slates extremely useful in the post-mortem and dissecting rooms for taking notes of lesions, etc. Malaria Chart with over 20 different forms of parasites and pigmented leucocytes, represented in their natural colours, absolutely indispensable to the study of this fever and specimens of their high class medical illustrations and their unique publication of clinical figures, now in use all over the world.

J. DUBOIS AND SONS, LIMITED (Sanitary Department) exhibited the Factor (Oranienburg) Filters. No claims are made for these filters further than that which has been stated on the one hand as the result of the investigations of Drs. Sims Woodhead and Wood, Johnston, Netter, and other observers who have investigated its action, and on the other hand which have been verified by the experience of the French army as recorded in the annual reports on its health issued by the War Office. This result is that, as stated by

Drs. Sims Woodhead and Wood, it prevents the communication of infective disease; or, as stated by M. de Freycinet and General Zurlinden, whose experience is based on their application to 245,000 quarters in all parts of France, Algeria, Tunis, etc., for a series of years, that wherever these filters have been applied typhoid fever and waterborne disease have disappeared, even in the midst of a civil population supplied from the same water service and ravaged by the disease. The exhibit also shows filters of carbon in all forms granulated, block, powdered, and moulded into either basins or tubes, plain, manganous, silicated, and otherwise prepared, asbestos cloth and films, natural stone, spongy and magnetic iron in various combinations representing the whole of the most popular and most widely used filters of other kinds. Filters in candle form made of infusorial earth and in porous porcelain to imitate the Pasteur filter, and unwarrantably sold under its name are also shown. All these have been treated with water containing various organisms washed off agar cultures, so as to avoid inoculating sensible added quantities of nutrient matter. The water used for these experiments was the same for all. The organisms consist of typhoid, blue pus (pyocyanus), and others. In every case the test organisms passed through each of these filters and in no case through a Pasteur filter simultaneously and similarly inoculated. These results are, of course, well known, but they are exhibited to draw attention to the grave danger to the public involved in the sale of such filters as are capable of preventing disease. The names of the makers of the respective filters are purposely suppressed, but the collection may be taken as typical of a great number of filters at present on the British market. In order to indicate that the chemical action claimed for these filters is merely transient, a dilute lead acetate solution is passed through them, and the presence of lead is shown in the filtrate. Equifex Disinfection: The Equifex Disinfection Appliances are based on the work of the late M. Charles Herscher. They have been investigated by the leading French, German, Danish, and other authorities, and are recognised throughout all countries as the standard appliances for their respective purposes. The Stoves for Saturated Steam under pressure give a uniform temperature of absolute or limited disinfection, as may be desired. The time involved is considerably less, and the temperature necessary is lower, than are required in superheated steam stoves. The Valveless Equifex Stove works at 104° C. to 105° C., and gives reliable disinfection of all contagia perishing at that temperature. Its pressure is limited without the use of any pressure or safety valve or other mechanical contrivance of which the failure can impose any strain on the stove. It is self-contained and can be worked with safety and reliability by a person without previous experience. It can be fitted with a recording gauge, giving a graphic account of the successive disinfections. The Equifex Sprayer has for some years been used throughout Paris and most French towns for all purposes for which sulphurous acid was previously used. It has been found by the various authorities who have adopted it to be absolutely reliable, enabling a suitable disinfectant to be applied in such form as will prevent it from drying off too quickly or injuring the material to which it is applied. It saves a very large amount of time and expense, as compared with sulphurous acid, and does not involve the eviction of the inhabitants. Dr. Scarsfield's Air-testing Apparatus is a portable cylinder fitted so as to permit the aspiration of air through tubes containing a solution which is decolorised by carbonic acid. The quantities of air from outside the room of which the ventilation is to be tested and that from inside which are respectively necessary to decolorise separate tubes in the apparatus containing the same solution are shown on the apparatus; and in this way a person can in two or three minutes, without any analysis whatever, make a reliable approximate estimate of the extent to which ventilation is sufficient. It is believed that this will be found of great convenience in sanitary inspections.

THE DORRIS BELTS COMPANY (61, Moles Lane, E.C.4) again exhibited several of their well-known Belts and appliances for wearing during pregnancy and after accouchement. Their Hypogastric Belt with the cushioned pad, and the support for Umbilical Hernia, find great favour, and afford much comfort and relief to the wearers. This Company also showed

a new Pregnancy Corset to be worn during that period, the lower part of which is composed entirely of silk elastic, allowing of easy expansion where necessary, and preventing undue pressure. Their Belt Corset is a well-shaped corset with belt combined, having all the advantages of each without the inconvenience of wearing the separate articles. It is made in pure wool, and various materials with an elastic insertion at each side, preventing tight lacing.

Messrs. DOWIE and MARSHALL's exhibits included Dowie and Marshall's Patented Bandage Boot for Weak Ankles and Flat Feet. The object of Dowie and Marshall's patent is to obtain the necessary assistance by a support which clings all round the bones, and adapts itself as far as possible into and around the various curves. It is a somewhat supple bandage, which derives its necessary resistance from the sole of the boot. For flat feet a pad of yielding rubber or horsehair, according to the amount of pressure required under the arch, is fastened round with chamois leather and held up, and tightened as required by chamois straps. For weak ankles the bandage is carried higher, and the required support is continued by straps fastened inside the leg part of the boot. Mechanical arrangement of a division in the sole of the boot for the straightening of a diverted great toe. Arrangement for the strapping down of contracted and hammer toes. Various wood designs and lasts showing the different methods they adopt for fitting feet, whether normal, contracted, flat, or whatever the characteristic may be. A variety of boots and shoes adapted for different purposes, some for rheumatism, gout, cold feet, etc. Specimens of easy boots and shoes for normal feet of medical gentlemen and the general public, made with Dowie and Marshall's elastic waists. Boots straight at the inner side for great toe, as well as moveable diagrams showing how boots which are made on lasts wrongly shaped may be quite straight inside and yet not allow the great toes to set at the straight inner line.

Messrs. DUNCAN, FLOCKHART and CO. (Edinburgh), showed Bland's Pill; 1, 2, and 3 pill of guaranteed strength. Varieties of Bland Capsules; combination with arsenic, aloes, nuxvomica, cascara, etc. Easton Capsules, equivalent to 20, 30, and 60 minims of syrup. Cascara Capsules, of which they were the original makers. Their cascara preparations are all made from directly imported and selected bark. Bichromate of Potash Capsules, $\frac{1}{2}$ grain, for use in all cases of indigestion associated with ulceration, etc. Gregory's Powder Capsules, each equivalent to one teaspoonful of the powder. Keratinoids, or Intestinal Capsules, which are insoluble in the gastric juice, but dissolve in the alkaline contents of the duodenum, for example, carbolic acid, creosote, etc. Plastic Pills or Gelatine Coated Pills, which are soft and plastic, and which return to the spherical state, even when pressed flat between the fingers. Perles of Turpentine, Terebene, Nitroglycerine, Creosote, etc. Coated Pills of all kinds. Compressed Tablets of all kinds, including Thyroid and Orchitic Tablets. Chloroform in original bottles, showing hermetically sealed flasks used for export. Also Chloroform sp. gr. 1.490, found to be practically non-decomposable, and containing about 1 per cent. of absolute alcohol. Pharmaceutical Preparations. Concentrated Infusions, prepared without evaporation, and retaining full aroma, etc.; a special feature in Inf. gent. co., Inf. senegæ co., etc. Syr. Hypophos. Co. Baumol Soap. Also Antiseptic Dusting Powder, Jelly, Dermolia.

Messrs. FAIRCHILD BROTHERS and FOSTER (New York; London agents, Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C.) showed their Pepsin (Fairchild). It is absolutely pure, and will, it is claimed, digest no less than 800 times its weight of egg albumen according to the standard test. In order to get the full benefit of pepsin it is necessary to administer it in combination with a slight quantity of acid. This is because it happens sometimes that the stomach secretes an insufficient quantity of acid. In Pepsin Tablets (Fairchild) this has been done, the ferment being combined with an appropriate quantity of acid accompanied by appropriate adjuvant aromatics. Glycerinum Pepticum (Fairchild), a glycerine extract of the peptic ferments possessing all the characteristics of a concentrated and very active solution of pepsin. It has no objectionable odour or taste, keeps well, is uniform in action and free from peptone. Zymine (Fairchild). This pancreatic extract con-

tains all the digestive principles of that organ; trypsin converting albumens into peptones, diastase converting starches into dextrines and sugar, the emulsive ferment essential to the assimilation of fats and oils, and the milk-curdling ferment are all present in an active and permanent form. Zymine, when required for the peptonisation of food, may be used in the form of powder, in 5 to 6 gr. doses, mixed with food, or, better still, in Tabloids, which may be swallowed whole. They are prepared coated either with sugar or keratin. For the peptonisation of milk and other predigested foods for the sick, Zymine Peptonising Tubes are well adapted. Each tube contains 5 grains of zymine and 15 grains of bicarbonate of sodium, just sufficient for one pint of milk. By this means the peptonising powder is supplied in an accurate and portable form, secured from deterioration and extremely convenient in use. Pepsinella (Fairchild) is a liquid preparation prepared by maceration of the stomach of the pig and calf. It contains, therefore, the ferments of both organs, and is used principally for the preparation of easily digested jellies. Peptogenic Milk Powder (Fairchild), added to diluted cow's milk modifies its chemical composition to that of human milk. Panopepton (Fairchild) is a preparation of bread and beef peptone made from cooked and predigested beef and entire wheat. It is finally condensed and sterilised and thus forms a valuable diet after surgical operations and for general purposes.

Messrs. FENNIS and CO. (Bristol) exhibited their Aseptic Surgical Instruments. These were displayed separately, also in aseptic cases, comprising amongst others the following useful sets: Minor Operating Eye, Dissecting, Pocket Dressing (various patterns), Scapels in sets of six and twelve, also twelve assorted Knives fitting one handle, together with Flushing Curettes, similarly arranged; a specially aseptic form of Cooper Rose's Vaccinator was also shown in this section, together with their Napier's pattern. With the Hypodermic Syringes they showed a specially antiseptic pattern made with a solid metal piston; they also showed the original "De Bove" pattern, for which they hold the sole English agency. A collection of Mr. J. Craig Smith's Special Instruments used by him in abdominal surgery was displayed on one stand. The flat leather pocket cases are worthy of notice as being a convenient shape for the pocket, easily opened to the full extent, and showing at a glance the whole contents. Amongst the drugs and sundries "Sascol" calls for attention; a neutral Hydrocarbon, used as a vehicle for the administration of various drugs in the form of spray to the throat and nose; two forms of Atomisers were shown with it, one for the postnasal and the other for antial use. Their "Ever Ready" Caddies are useful and economical, giving every facility for use in emergency, at the same time affording means of keeping the plasters and dressings clean and tidy, and thus saving time and waste. The cabinets constructed to hold the caddies present a neat appearance, and insure all dressings being close at hand when needed. The Urinary Cabinet shown on the same stand presents a most compact form, the slope at the back arranged to carry off the water adding much to the cleanliness of the stand. They showed also Thyroid Preparations, which are worthy of note.

Messrs. J. S. FRY and SONS (Bristol and London) had an attractive exhibit, where samples of their Pure Concentrated Cocoa could be obtained. This article is manufactured by a new and special scientific process, securing extreme solubility and developing the finest flavour of the cocoa, and is recommended for the use of persons having weak digestive organs.

Messrs. C. J. HEWLETT and SON (40, 41, and 42, Charlotte Street, London, E.C.) exhibited a number of new drugs and fine chemicals, such as Alcohol, Aroclene Hydrobromate, Ferratin, Thioform, etc. Amongst their improved pharmaceutical preparations were Mist. Peppone Co. c. Eucalypti, Liquor Santal Flav., etc., whilst of more recent introduction were Mist. Damiana Co., Mist. Hepatica Co., and Mist. Hematoxyli Co. A very complete series of Fluid Extracts were shown, and a large variety of Medical Flexible Capsules. Antiseptic preparations, such as Antiseptic Pills, Jellies, Cream, etc., occupied a prominent place, and included Messrs. Hewlett's Disinfectant Liquid, a preparation consisting of the chief constituents of creosote acid, mixed with water. Clinical tests for urine analysis have lately been

a feature in Messrs. Hewlett and Son's exhibits, and an improved Esbach's Albuminometer was shown. There were also cabinets of histological and pathological specimens for microscopic examination. An improved Needle Holder with an entirely new principle in the rack catch was shown; also improved Bone Forceps, manufactured at the suggestion of Dr. Thomas H. Morton, of Brightside, Sheffield, with serrated edge and closing screw for dividing metacarpals, phalanges, etc.

Mr. B. KURN (St. Mary-at-Hill, Eastcheap) showed Dr. Palmer's Sublimated Paper which is prepared by a special process, by which sublimate is kept in a soluble form in the paper and each paper is accurately dosed. The papers are put up in envelopes containing 10 leaves each, which is the most convenient form in which sublimate can be carried about for immediate use; these papers on account of their shape and having the nature and dose of the preparation printed on them, make accidents such as have lately occurred with sublimate tablets quite impossible; there is no objectionable smell. Great improvement has of late been introduced in the ethyl chloride bulb. The anesthetic cylinders have been improved by introducing a screw cock and two interchangeable patent sprays (one coarse and one fine). By two turns of the screw cock the jet of anesthetic issues, and by two reverse turns the jet is stopped. This arrangement is far simpler than the present one of unscrewing and rescrewing the top cap.

Dr. R. J. LEE exhibited the Fumerette. The chief purpose for which this instrument is intended is to provide an easy method of burning opium, stramonium, and similar agents, for inhalation. It appears that there is no difficulty in obtaining vapours from any medicinal agents without smoking the substances, and this is effected by a small jet of air, which draws the vapour from the bowl, in which the opium or other agent is heated by means of a small elastic air ball. The inhalation of the substance is administered by a nurse or attendant, if necessary, and no smoking is necessary. The Fumerette is introduced by the Apothecaries Society, Blackfriars, as well as some preparations suitable for inhalation as opium, lobelia, etc. The preparations of Messrs. Savory and Moore from the leaves of stramonium can be used for asthma.

LESLIE AND CO., (Wallbrook), had an exhibit of Surgical Plasters and Surgical Dressings. Their Tape Plaster, which is perfectly self-adhesive, is well known, but they have lately introduced plasters in rubber combination. Following the lead of the Americans, they retain in all their new manufactures pliability, which has been their aim from the first. They are, we believe, the first in the field to spread this rubber combination on brown holland. As they were the first to use that material for surgical strapping, their powerful machinery easily perforates this difficult fabric, the longer threads of which have hitherto proved unsurmountable. Their Antiseptic Preparations are very nicely put up in cartons, and will, in all instances, be found perfectly reliable. They claim that their Clinical Thermometers, manufactured specially by a London expert, are in every instance reliable. The fact that they supply the principal hospitals in the United Kingdom and all departments of the Government services and the principal hospitals in the Colonies with their plasters and surgical dressings is a guarantee of their value.

Mr. H. K. Lewis (Gower Street) exhibited an important selection of his well known Publications in the various branches of medicine and surgery. Among the more recent books we notice a new and revised edition of Dr. F. T. Roberts' standard work *The Practice of Medicine*, which well sustains its established reputation. To his practical series Mr. Lewis has just added a new book by Mr. D'Arcy Power on *The Surgical Diseases of Children* and new editions of Dr. Lewis Jones's *Medical Electricity* and Dr. L. C. Parker's *Hygiene and Public Health*. Two important translations from the German may be noticed—Schimmelbusch's *Aseptic Treatment of Wounds* and Dührssen's *Gynaecological Practice*—both of which are well worth perusal. Onodi's *Atlas of the Nasal Cavities* and Shuttleworth's *Mentally-deficient Children* are other novelties.

Next to the foregoing that most useful institution the New Sydenham Society shows some of its attractive Publications which should, we think, recommend this Society to the favour-

able notice of the profession. For its modest subscription of one guinea the Society last year gave its members two handsome volumes, one on *Malaria*, by Bignami, Mannaberg, and Marchisiani, and the other on the *Spinal Cord*, by Pierre Marie, as well as a fasciculus of the *Atlas of Pathology*, containing coloured plates illustrative of diseases of the testes.

THE LIVERPOOL LINT COMPANY showed their Splint Padding, a dressing composed of absorbent wool and carbolicised tow laid between layers of gauze; it is soft, springy, absorbent, and antiseptic, and on these points it is claimed to be one of the most useful dressings manufactured. Protective Lint: Ordinary lint of specially good quality, having on the back or smooth side an impermeable material, rendering unnecessary the use of silk protective, gutta serena tissue, etc. First Aid Dressings: These comprise in a small packet all the materials necessary for the first dressing of wounds. In addition they showed a general assortment of Lints, Cotton Wools, Bandages, Tows, etc.

Mr. W. MARTINDALE (10, New Cavendish Street, London) exhibited a series of new Medicinal Chemicals and Pharmaceutical Preparations, principally of the unofficial character described in the *Extra Pharmacopœia*. Among the former was included a series of the Organic Compounds illustrating the recent introductions into modern Materia Medica; these included beautiful specimens, well displayed, of Camphoric Acid, Sulphanilic Acid, and Sulphanilate of Sodium; the Guaiacol Compounds used for phthisis, Guaiacol Crystals, Guaiacol Carbonate, and Benzozol; the Naphthol Compounds which have been used for intestinal antiseptics, Naphthalene, β -Naphthol, Benzo-naphthol, and Betol; α hypnotics, Chloralamide, Chloralose, Metalddehyde, Urethane, and the three allied Sulphonated Methanes—Sulphonol, Tetronal, and Trional; as antipyretics and antiarthritics, Salacetol, Salol, Phenocol, Hydrochlorate and Lactophenin, also Piperazine in tablets and in granular effervescent form. A series of Quinine Salts included some beautiful crystals of the Acid Hydrobromate and Valerianate, and the very soluble Hydrochloro-sulphate. Of Cocaine, some Crystals of the pure Alkaloid and Hydrochlorate, as well as some large Crystals of the Nitrate. Also of Scopolamine, some beautiful large crystals of the Hydrobromate, which is made official in the German Pharmacopœia; this is the salt of the pure form of the base formerly known as hyoscyne; it is a powerful mydriatic, and has the advantage of not causing dryness of the throat. It is used, like hyoscyne, also for acute mania. Among pharmaceutical preparations Mr. Martindale exhibited Arsenical Paste for dental use; several varieties of Nasal and Urethral Bougies, as well as of Cachets, which now form a favourite method of dispensing insoluble and nauseous medicines; Camphoid, a substitute for collodion, containing the pyroxilin in camphor solution, which may be used as a vehicle for chrysarobin and other medicaments; Epidermin, another basis for skin medication, was also shown; Flexible Capsules, containing various medicaments, and Glass Capsules, containing volatile liquids for inhalation—nitrite of amyl, iodide of ethyl, and chloroform—which are special preparations of Mr. Martindale. Two dentifrices, Salicifrice and Chloratifice, whose composition is indicated by their names; the latter appears to be a useful detergent in septic conditions of the mouth and gums. Besides Cocaine, he exhibited several Galenical preparations of Coca, including an Elixir; also an Elixir of Cascara, and one representing Easton's Syrup, which is very palatable. An Ammoniated Liquor of Ergot claims to be an active and reliable preparation. He also exhibited a series of Granular Effervescent Preparations which he has introduced—Effervescent Sulphate of Sodium, Sodio-Magnesian Aperient, and Piperazine. Inhalers—the Portable Inhaler and Poor Man's Inhaler for hot medicated moist air, and Osmic and Nasal Osmic Inhalers for dry inhalation, are simple and useful appliances for throat and lung medication. A series of Suppositories, including Glycerine and Peptonised Beef, were attractive in appearance. Medicated Chocolate Tablets, including Nitroglycerine, Strophanthus, and Cocaine, of which Mr. Martindale was the originator, form active preparations. Ceratum Petrolei and Ointments of Boracic Acid, etc.; also Unna's ointments with Cassia buds in tubus. A series of small tubes were shown containing ointments of Atropine, and Atropine with Cocaine, for oph-

thalmic use; Sublimate Pastils, coloured blue, for making antiseptic lotions, and of Sulphate of Zinc, coloured red, for Red Lotion. Pastils of glycojelatine basis as well as Pastils, which Mr. Martindale has introduced, containing Guimauve paste as a basis, for throat medication. Silicate of Potassium Solution, nearly neutral, recommended for impregnating bandages. Petroleum Emulsion with Hypophosphites as a substitute for Cod-Liver Oil. Concentrated Saline Solution in sealed tubes for intravenous injection. Preparations of Senecio for amenorrhoea and dysmenorrhoea. A Wine of pure Foxglove, equal to Ipecacuanha Wine. A strong Elixiring Colloidal and a similar preparation of Belladonna. A series of Histological Preparations was illustrated by the microscope; and, lastly, a beautiful series of pills, pilules, and granules, at which the author of the *Extra Pharmacopoeia* is an adept, proved not the least attractive part of his exhibit; some of them with their elegant translucent coating resembled pearls in their lustre. These he undertakes to dispense extemporaneously according to recipe when required.

Mr. J. H. MONTAGUE (New Bond Street, W.) showed Carter Braine's Improved Chloroform Inhaler, which may be placed in any position without fear of forcing pure chloroform instead of chloroform vapour; this is a most valuable improvement. Hugh Fenton's Improved set of Uterine Dilators in case; these are made with one size at each end, the middle of the dilator being small so as easily to admit of fingers in assisting introduction, and the other end answering as a handle. Improved Serre-Neck in Delta Metal. Morrison's Improved Tonsil Guillotine, the cutting blade being crescent-shaped. Set of Nasal Retractors, six different sizes in case. Eric France's Phimosis Scissors, combining forceps, probe, and scissors. Set of three different sizes Improved Aseptic Trophines fitting one handle, taking entirely to pieces and admitting of being boiled or sterilised separately. Back Rest for placing under patients when being bandaged. Barker's Flushing Curette, with four sizes of scoops. Improved Ophthalmoscopes. Aluminium Splint for Curved Tibia, for young children, where extreme lightness is most essential; this splint is made to extend from just above the knee to below the ankle, and has been found most efficient in curing bow-leg. Patent Ear Syringe, for the use of patients and nurses; the syringe to be gently placed in the ear as far as convenient, the point of the nozzle to be kept uppermost; no further directions are necessary, as the stream of water must pass along the roof of the passage, consequently the ear is completely cleansed; the point of the nozzle cannot pass too far, so this syringe is perfectly harmless in the hands of anyone. Carter Braine's Improved Ormsby's Inhaler, with celluloid facepiece and extra large bag. Rendle's Mask in Celluloid. Dr. Carré's Transfusion Apparatus: this is an emergency case, containing everything necessary for transfusion, is very compact—it can be put into the pocket, it is so compact. Marmaduke Sheild's Combination Instrument, containing as one separator, probe, director, and aneurysm needle, and is made in size to fit an ordinary pocket case. Accumulator for Cautey and Light; it is specially designed for portability and utility for several purposes; it consists of four cells, each in a separate ebonite box, and the whole contained in a polished teak outer case; these cells can be joined together to work as two large cells for the cautey (4 volts), or as four small cells, giving 8 volts, for lighting a lamp; there is a separate regulating resistance for each, so that the required degree of heat or brightness of light can be accurately obtained; the weight complete is 16½ lbs., and the dimensions 7 in. by 5 in. by 7 in. high; all the fittings are nickel plated. Slatter's Post-partum Uterine Compress; this consists of a concavo-convex pad covered and padded with thick white kid; it is kept in position by an abdominal band of 3 inch webbing, connected to and buckling over the pad; attached to the lower edge is a steel loop through which one attaches the sanitary towel or diaper. Catgut Ligatures on glass reels in carbolic solution, on quite an improved principle, whereby the surgeon can easily refill the glass reels without the great inconvenience found with those with india rubber cap or stopper. Drainage Tubes of different sizes, of india-rubber, in celluloid phials in carbolic solution. A large assortment of the latest Aseptic Instruments.

Messrs. LORIMER AND CO. exhibited Lac Magnesia (Mistura Magnesia c. Saccharo). Each ounce contains the equivalent of 10 grains of pure calcined magnesia oxide in the form of freshly precipitated hydrate. It has the same advantage over the fluid magnesia as the oxide has over the carbonate, while it will keep indefinitely without change. The magnesia will not sink to the bottom, but will continue diffused throughout the liquid as when freshly prepared. It is pleasantly sweetened and very palatable. Dermoplastin or Eczema Cream, an emulsion of vaseline with boric acid, zinc, and bismuth. In addition to the well-known cooling properties of the other ingredients, the slow evaporation of the water, as contained in this preparation, quickly lowers the temperature of the skin, giving speedy and permanent relief to the irritable surface. Its use is indicated in all cases of skin irritation from whatever cause arising, such as eczema, burns, acne, itching, etc. Vin Coce (Lorimer's), in imperial pint bottles only. The most elegant form in which erythroxylon coca can be prescribed. It is said to be prepared from the finest parcels of leaves obtainable in London; each bale is carefully analysed, consequently its alkaloidal value never varies. Syr. Hypophosph. Co., in 1 and 1 lb. bottles. Each fluid drachm contains lime hypophosphite, 2 grains; sodium hypophosphite, 1½ grain; potassium hypophosphite, 1 grain; iron hypophosphite, ½ grain; manganese hypophosphite, ½ grain; quinine hypophosphite, ½ grain; strychnine hypophosphite, ¼ grain. The formula is original, founded on scientific principles, and has stood the test of practical experience. It is neutral, or very slightly alkaline. Ol. Iodi (Lorimer's) for outward application only. Each fluid ounce represents 10 grains of iodine. When necessary the strength can be increased by the addition of tinct. iodi, or diminished by the addition of water. It is readily absorbed, and does not stain the skin. The iodine very soon after application is absorbed, and can be detected in the secretions—urine, sweat, saliva, and milk. This absorbent action is continued so long as the oil is used. Ext. Hamamelis Dist. (Lorimer's): In 4oz. and 12oz. bottles. Distilled extract of witch hazel in a clear, aqueous liquid, obtained by distilling the fresh green bark of the hamamelis virginica. It is non-poisonous, of sweetish taste, and pleasant odour, it does not stain linen, nor cause irritation. Its uses are very numerous. Capsules (hard or soft) of all important drugs. Coated Pills and Tablets: Soluble coating, warranted in all climates; all new and improved formula. Compressed Tablets: Plain and sugar-coated, of simple drugs, and all combination Suppositories in convenient form with tubes of vaseline in each box. The Perfect Castor Oil, Tasteless. Infants' Food, free from starch, fully digested. Chocolate Aperients: Ordinary chocolates containing 1 grain calomel in each. Effervescent Salts, Caffein Hydrobrom, Piperazine, Piperazine et Phenocoll Hydrochlor., Antipyrin, Broncho-Caffein, etc. Cachets of all nauseous drugs. Extract of Malt and Cream, that is, new milk evaporated to consistence of and combined in equal parts with malt extract. Pepsine Sauce, Medicated Lozenges, all sorts. Capsuled Horse Balls. Patent Flesh Rubbers. Hygienic Towels.

G. VAN ABBOTT AND SONS (8, Duke Street Mansions, Grosvenor Square, London) had on view a large selection of Diabetic Foods, consisting of Gluten Bread, Biscottes, Flour, Semola, Macaroni, Vermicelli and Chocolate, Saccharin, Chocolate, Soya Bread and Biscuits, Soya and Caraway Biscuits, Gluten and Ginger Biscuits, Almond Cakes and Biscuits, Coconut Biscuits, Euthenia Biscuits, Gluten and Meat Biscuits, Diabetic Rusks, and Bran Biscuits; Almond Flour, Bean Powder, Coconut Flour, Gluten Flour, and Soya Flour for cooking purposes; Cal's Foot Jelly, sweetened with Saccharin; Ivory Jelly, Boal Turtle and other Soups, Meat Lozenges, Concentrated Beef-tea. The Foods for Obesity consist of Kalos Biscuits, Soya and Cheese Straw and Special Diet Rolls, and a variety of Soft Loaves and Cakes. For Constipation, Bran Biscuits specially prepared free from drugs. Delicate Children: Hypophosphite of Lime Biscuits, especially for those suffering from deficiency of bone, weak joints, or debility, one biscuit to be taken three times a day directly after meals. The above were suggested by Mr. Wm. Adams, F.R.C.S. Their new manufactory is fitted with patent ovens and all the latest sanitary improvements. The bakehouse is entirely above ground.

CORRESPONDENCE.

WILHELM MEYER MEMORIAL.

SIR.—With your permission, we wish to enlist the interest of your readers in a movement of a somewhat unusual character. Twenty-seven years ago, Dr. Hans Wilhelm Meyer, of Copenhagen, recognised that an enlargement of the glands situated between the nose and the throat, to which he gave the name of "adenoid vegetations," was the most fertile cause of deafness and imperfect nasal respiration in children. This discovery represents one of the most important practical advances of modern medicine.

Already many thousand persons, through the timely removal of the enlarged glands, have been saved from lifelong deafness or from the lasting consequences of obstructed respiration; and it may be safely said that to no one of our contemporaries are we more deeply indebted for the development of a healthy mind in a healthy body of the rising generation than to Hans Wilhelm Meyer.

On the recent death of this eminent man it was felt that his unusual merits deserved unusual recognition, and the proposal to erect a statue to him at Copenhagen has met with a most sympathetic reception, not only by his fellow-countrymen, but also by the medical profession of other countries.

H.R.H. the Princess of Wales has most graciously consented to give her patronage to the scheme, and has expressed her sincere gratification at the idea that so eminent a fellow-countryman of Her Royal Highness should be thus honoured.

The Municipality of Copenhagen have promised to grant a suitable site for the statue, and at this moment in almost every country committees are being formed for the furtherance of this object.

Whilst as a rule the medical profession, when they wish to do honour to their great living or dead, confine their appeals to the ranks of the profession itself, in the present instance it is thought that an opportunity should be given to the numberless parents of children, whose sound development and the preservation of whose hearing have been rendered possible by Dr. Meyer's discovery, to show their gratitude by contributing toward a memorial in appreciation of his great services.

We therefore, through the medium of your columns, venture to invite subscriptions, which may be sent to our Hon. Treasurer, Mr. A. E. Cumberbatch, F.R.C.S., 80, Portland Place, London, W., and will be duly acknowledged in the journals.—We are, etc.,

FELIX SEMON, M.D.,

Chairman of the Committee.

J. RUSSELL REYNOLDS, M.D., F.R.S.,

President of the Royal College of Physicians.

CHRISTOPHER HEATH, F.R.C.S.,

President of the Royal College of Surgeons.

THOMAS BARR, M.D.

HENRY T. BUTLIN, F.R.C.S.

W. E. CHADLER, M.D.

A. E. CUMBERBATCH, F.R.C.S.,

Hon. Treasurer.

W. B. DALBY, F.R.C.S.

GEORGE P. FIELD, M.R.C.S.

O. E. FITZGERALD, M.D.

DUNDAS GRANT, M.D.

F. DE HAVILLAND HALL, M.D.

GREVILLE MACDONALD, M.D.

URBAN PRITCHARD, M.D.

FUSACE SMITH, M.D.

PHILIP SMYLY, M.D.

W. McNEIL WHISTLER, M.D.

WATSON WILLIAMS, M.D.

E. CHESWELL BAKER, M.B.,

77, Western Road, Brighton,

CH. A. BALLANCK, F.R.C.S.,

100, Harley Street, W.,

Honorary
Secretaries.

THE INDEX MEDICUS.

SIR.—Many, like myself, will welcome the prospect there still appears to be of that most invaluable reference book, the *Index Medicus*, being continued. I speak as a younger member of the profession, and doubt not I reflect the opinion of numerous others of a like standing that the *Index* has been

a source of incalculable value to us in the special way such works alone can be. The Librarian of any medical library, and I am sure the estimable Librarian of the Faculty of Physicians and Surgeons, Glasgow, would support me in the statement that no work of reference is so frequently consulted as this excellent and exhaustive one.

When Mr. Macalister's letter appeared in the *BRITISH MEDICAL JOURNAL* one method occurred to me by which it might prove possible to raise the necessary funds, and so maintain the issue of the work without fear of future financial difficulties. Seeing that the publishers require a certain sum from Great Britain, I would propose that the various universities, medical corporations, medical societies, and other scientific bodies in the country be asked to subscribe an amount which collectively would cover the requisite sum. A work of such universal importance to the profession should receive the unbroken and guarded support of corporate bodies, and not be left to depend upon the intermittent and uncertain efforts of individuals. May I also venture to suggest that a continuance of the work issued monthly would be preferable to a quarterly issue?—I am, etc.,

A. ERNEST MAYLARD, B.S. Lond.,

Surgeon to the Victoria Infirmary.

Glasgow, July 27th.

THE THROAT HOSPITAL, GOLDEN SQUARE.

SIR.—We shall be obliged if you will kindly allow us to state in the *BRITISH MEDICAL JOURNAL* that we have now entirely severed our connection with the Throat Hospital in Golden Square.—We are, etc.,

SUTHERLAND,

Lately President of the Throat Hospital,
Golden Square, London.

R. COURTENAY WELCH,

Lately a member, and for nearly twelve years
Chairman of the Committee of Management
of the Throat Hospital.

GREVILLE MACDONALD,

Lately Dean of the Medical School, and for
eight years Physician to the Throat Hos-
pital.

Stafford House, St. James's, July 31st.

ASSOCIATION INTELLIGENCE.

BRANCH MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—The annual meeting, which was unavoidably postponed, will be held at Dumfries in the third week of August. Due notice will be given by circular.—J. ALTHAM, Honorary Secretary, Perth.

MIDLAND BRANCH; DERBYSHIRE DIVISION.—There will be a meeting at the Whitworth Institute, Harley Road, on Thursday, September 28th. The President, Dr. Maxon, kindly invites the members to a luncheon tea, and Lady Whitworth will draw a few bar gardens and grounds. Afterwards it is proposed to drive to Ratton, both to dine at the New Bath Hotel. Members are requested to give notice of communications to be brought before the meeting before August 20th to J. A. SUTHERLAND, Honorary Secretary, Friar Gate, Derby.

NORTH OF ENGLAND BRANCH.

The thirty-first annual meeting was held at the Royal Hotel, South Shields, on Thursday, July 25th, at 5 p.m.

Presidential Address.—The retiring President (Dr. OLIVER) vacated the chair in favour of Dr. CHAP (President-elect), who delivered the annual address.

Reports.—The report of the Council of Management and the Treasurer's accounts were read and approved.

Election of Officers.—Dr. Davis, of West Hartlepool, was unanimously chosen as President-elect. The representatives on the Council of the Association were then re-elected, as also was the representative on the Parliamentary Bills Committee.

Dinner.—The dinner, after the meeting, took place at the Royal Hotel, South Shields.

NOTICE TO OUR READERS.—Owing to very great pressure on our space due to the reports of the proceedings at the annual meeting a large number of letters and other matter is unavoidably held over.

- * Mr. Ferguson gains the Brunton Memorial Prize of £10, awarded to the most distinguished Graduate of Medicine of the year.

**BRITISH MEDICAL ASSOCIATION.
SUBSCRIPTIONS FOR 1895.**

SUBSCRIPTIONS to the Association for 1895 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches are requested to forward their remittances to the General Secretary, 429, Strand, London. Post-office Orders should be made payable at the General Post Office, London.

British Medical Journal.

SATURDAY, AUGUST 3RD, 1895.

THE PRESIDENT'S ADDRESS.

THE President of the British Medical Association on the occasion of the London meeting of the year of our Lord 1895 occupied a unique position. We run no risk of offence when we say that Sir John Russell Reynolds has presided at the greatest assembly that our profession has ever known. In saying this we do not forget the great International Congress either in our own country or abroad; in mere numbers, for aught we know, some of these meetings may have surpassed the Association meeting of this week. English medicine has, however, this week shown itself in numbers vast enough to fire the most sluggish imagination; while, on the other hand, the age, standing, and prosperity of our Association give a unity, a dignity, and an impressiveness to its chief assemblies which are wanting to the more or less motley and fortuitous gatherings which have not a national character. Moreover, the Association has now lived long enough to have assimilated all that is characteristic of maturity; it has integrated into itself all those forces of tradition and prescription which command respect, and exercise a shaping influence upon rising generations.

In the person of the President of the College of Physicians the Association found also a President in whose person these qualities and endowments are characteristically expressed. On the other hand the President derived a force and an ascendancy from the solid phalanx of the profession behind him that no section of it, however honourable, could impart.

Great as was the occasion, the President was in no whit behind the claims of his office. Although in his gracious hospitality, his prudent counsels, and persuasive influence the President made himself felt rather than seen by many of his guests, yet in his wise and eloquent address his personality was made manifest to the whole body. To enter into a critical examination of the high arguments and earnest exhortations of this address would be no unpleasant duty at a more appropriate time; now we can do little more than express to the President our cordial congratulations, and our appreciation of the scientific insight and the moral weight which pervaded his impressive discourse—a discourse worthy of the speaker and of the occasion.

In his survey of the present place of medicine, the President pointed out to us the striking fact that therapeutics, without forgetting the valuable means derived from the inorganic world, had newly armed herself with weapons

derived from life itself. He went on to point out farther that this is not to be regarded as a mere addition of materials to our stores, but as a new attitude of thought, and a nearer approach to a control of vital function in its own laboratory. In the use of glandular extracts, defensive proteids and the like, "Nature has, as it were, taken man more into her confidence." We do not think that the speaker strengthened his own case in the demurrer that "Search while we may, 'life' eludes our search and resists our efforts." These words, quoted by the President from another physician, seem to us to be either an untruth or a truism. Of "life in itself" we know as much or as little as of a humming-top "in itself;" of "things in themselves" no thoughtful man expects in this world to know anything, and does not, if he is wise, try to know it. We can never know more of "life" than as a certain series of phenomena, and to say that we know no more of this series than our fathers knew is too gloomy a view of modern labours.

In another section of his subject the President seemed to us, on the other hand, too sanguine. To a cultivated and philosophical observer no doubt the custom of naming newly-described symptom groups after "Brown, Jones, and Robinson" is clumsy, and even rather grotesque; but something can be said, in our opinion, for this custom. In the President's own words, we have to deal with "a tremendous store of material"—tremendous indeed! And are we not in the position of a curator of a museum upon whom enthusiastic friends are every hour shovelling fresh quantities of such stores? To pronounce anything like a definite opinion on any large part of these stores, to penetrate to the secret of their underlying genetic affinities is a very slow and tortuous process; meanwhile, to attach scientific names to each new thing as it comes is not only premature, but does harm, in that it attaches a name, more or less false, which is hard to get rid of when discredited by later researches. Are we not thankful, for instance, amid the imperfect distinctions of the various alleged forms of nephritis, to affix a mere ticket like "Bright's disease," which deceives no one and is, on the face of it, provisional? The President, indeed, warns us very clearly of the unfitness and deceptiveness of certain pretentious pathological names, which he illustrated by apt instances. The truth is nomenclature is not in the nature of things a science in which nomenclature finds its best application.

One shrewd sensible passage of this able address we have read with especial joy, because of its pregnant truth and, we will add, of its originality, namely, that in which the President attacks the "old-fashioned dreary lectures of an hour's duration, which have passed away." We are glad to hear that they have gone. Not only dreary, but mischievous would be our verdict upon those formal courses of "systematic lectures" which not only competed unfairly with practical work, but also kept up that very habit of regarding medicine as a sort of contemplative philosophic study which was impressed upon physicians by Galen to the destruction of medical progress for more than ten centuries. When Harvey pushed his books on one side, and said, "Here is a little bit of practical mechanics, let me see how it works," then it was that the new career of medicine began.

The President well observed that, since teaching had become more personal, and closer to realities, both teacher and

student had shown far more interest and earnestness in their work. In the formal and didactic utterances of the past there was plenty of assertion and show of knowledge, but the teachers neither believed nor comprehended half of their "sage pronouncements." These are words as true as they are brave and inspiring.

We trust that the grave and eloquent warnings of the latter part of this weighty address may reach a far wider audience than our own. The speaker, witnessing in sadness that "decay of reverence" which is the cause of the frivolity, flippancy, and intolerance of restraint in the life of the modern world and in its literature, laments the loss of that discipline by which, as he so well knows, a healthy and capable nervous system is to be built up. That which moralists call reverence physiologists recognise as "control." "Control" means the constructing of centre upon centre, the governance of the lower and more elemental parts of man by the continual superposition of more perfect mental instruments which raise him out of automatism, and enable him to see further and wider, to attain the knowledge of good and evil, and to choose between immediate and fleeting gratifications and those which, if more remote, are abiding.

In this growth of our highest centres lies "edification" in its real and practical sense. There is something more than an analogy, as the President pointed out, between weaknesses and vices of the body and those of the mind; and in his earnest and hopeful words he taught us how powerful is our office beyond its carnal aspects; and that the faithful physician will find the fruits of his labours not only in a healthier but also in a nobler people.

THE ADDRESS IN MEDICINE.

The careful and painstaking history of the growth of our art, and of the science with which in these latter days it is correlated, and by which its application is guided, will be read with great interest by all who recognise that, however great are the advances of our knowledge in recent times, the foundations on which they rest go deep down to that great capital of gradually accumulated experience which dates back to long before the era of written records.

The tale told by Sir William Broadbent, far back as it goes, is in fact but a fragment of history, a story without a beginning and without an end. "In the works of Hippocrates, the earliest medical literature which has come down to us, we are at once introduced to the theory and practice of the art of healing at a considerably advanced stage of development. Already there were rival schools of thought and treatment, and disease was discussed with extraordinary acumen from opposite points of view." The origin of medicine was far anterior to all history, and as to its end who shall ever guess it?

When we are told that "the instincts of the primitive man must have applied to remedies as well as food, and experience of their effects must have been accumulated and transmitted, embodied frequently in legend or superstition, as part of tribal knowledge," and when we bear in mind what instinct means, we see not only how early in man's history did he seek aid from medicine, but that then, as now, the art of medicine was founded on experience and observation. To turn now towards what to many will prove

the more interesting part of the address, we cannot but see how, by aid of that hastened experience which is founded on experiment, two distinct lines of investigation are converging the one upon the other; and how by the advances of organic and physiological chemistry on the one hand, and the intrusion of chemistry into pathology on the other, as illustrated by the isolation of the toxic substances on which, in some cases at least, the symptoms of disease depend, ground is given for the hope that sooner or later the disturbances of function caused both by diseases and by drugs may be capable of expression in chemical terms, that an era of antidotes may arise of which our present use of antitoxins gives but a dim forecast. Again and again Sir William Broadbent rings this note, that the influence of both disease and therapeutics on the environment of the cell is a matter of chemistry. "Chemistry must ultimately form the link between physiology, pathology, and therapeutics;" and he points out that while all vital actions are attended with molecular or chemical actions, and are, in fact, chemical actions coming under the laws of the correlation of force and the conservation of energy, so, also, are the therapeutical actions of drugs. The key then to therapeutics is to be found in the chemistry of vital processes, whether they be normal or pathological; and by so prominently associating the treatment of disease—so often looked on as a mere art—with chemistry, one of the most exact and progressive of the sciences, Sir William Broadbent has done well.

THE ADDRESS IN SURGERY.

Those who heard Mr. Hutchinson's Address in Surgery—and it is not the only thing that he has done for the success and distinction of this memorable meeting of our Association—had good measure served out to them, and were called to consider some very hard questions. In the first place, he asked them to look back at some aspects of the surgery of the past. Now, as a rule it is a waste of time for surgeons to consider carefully the work of their predecessors. There are, for example, the German monographs, that begin with Hippocrates, and would begin earlier if they could, refusing to let the dead bury their dead; this way of recalling the past is almost useless. And there are the innumerable Harveian and Hunterian orations, some of them so silent about Harvey or Hunter, and so full of things that Harvey and Hunter never knew, that they are like the wreaths of primroses hung anyhow on or near the statue of Lord Beaconsfield, hiding but not adorning it.

But it is possible to review the surgery of the past by a more profitable method than these. We may look at those stars only that are of the first magnitude; those "one or two immortal names," who in each age "rise slowly up into the sky, to shine there everlastingly." This, for example, is what Mr. Godlee did in his charming account of Ambroise Paré. Or we may take this or that special subject in medicine or surgery, and seek it in a past not too remote, so that we may mark the mistakes of our predecessors, and confess our own (the latter act is of great importance), and thus bridge the gap between them and us, and deal with ourselves as strictly as we deal with them. This is the way that Mr. Hutchinson has followed, and it is, for practice, the best way of all.

But (if such a phrase may be forgiven) he starts with a

digression. His account of Sharp's *Critical Inquiry into the Present State of Surgery*, and of Roux's observations, half a century later, on the schools of London and Paris, have no close connection with that later past of which he was himself witness. Assuredly Samuel Sharp is not "shining everlastingly;" he seems to have contemplated his art without advancing it, and to have believed, in 1750, that since the treatment of "tumours, wounds, abscesses, and ulcers" was the same everywhere, therefore it was in no need of improvement. M. Roux's name is better known to English surgeons, nor will it soon be forgotten now that his grand-nephew has added yet greater honour to it; but his estimate of English surgery about 1800, though of great interest, is nevertheless too remote to advance Mr. Hutchinson's argument, or to help him to get M. Roux into touch with his successors.

Thus Mr. Hutchinson is not at his best till he leaves the eighteenth century behind him, and considers the time when his own work began; and his address, from this point onward, has two aspects—surgical and ethical, and inasmuch as "conduct is nine-tenths of life," it is the ethical aspect of the address that gives it an especial value, and raises questions of especial difficulty; but if we are to get the full good of his thoughts, we must claim the right to rearrange his words. He has taken no care to give us an oration; he permits his criticism of the present arrangement of the College of Surgeons Museum, and of the five years curriculum, to interrupt a line of thought wholly foreign to these subjects.

Let us, therefore, take first the two great operations whose rise and zenith he has watched: ovariectomy and lithotomy. To him, as to all of us, there is but one surgeon—Sir Spencer Wells—to whom every history of ovariectomy must be dedicated. It is a wonderful story; Mr. Knowsley Thornton, some years ago, told it better than it had ever yet been told; but in Mr. Hutchinson's account there are his own recollections, and his own hard fight for the operation; his own first cases, his zeal in getting reports of the operation from every hospital in London, his courage in defying the verdict of his own reports—"We knew of fourteen cases in succession at different institutions, every one of which had ended in the death of the patient"—his early belief in the clamp, that evil invention that was perhaps, as he says, a necessary evil at one stage of development of the operation, but has now, happily, gone for all time, ever since Lister came and laid his hand on surgery, and created it all anew; and last, but not least, the fine honour which made him, in a later period of his career, transfer to other surgeons the very cases for whose cure he had thought and worked so hard.

The history of lithotomy is less known, and we wish Mr. Hutchinson had given more time to it. In the days before Sir Henry Thompson and Bigelow, it must, in spite of Brodie's teaching, have been a dreadful affair; and the success which Mr. Hutchinson gained by doing lithotomy in every case was, at that time, one of the best of the many good things that he has done for surgery. And on this field, also, in later years, as on the field of ovariectomy, he put surgery before self, the patient before the surgeon, and sent to "a specialist friend" every patient that was in need of Bigelow's operation.

And thus at last we come to what we may be sure was most in Mr. Hutchinson's mind when he prepared his address: we come to see the ethical aspect of these two old

stories re-told. Let us hear the conclusion of the whole matter. What guidance for our own daily work can we find in them?

We get a good example, hard to follow, a very counsel of perfection, in his rule of transferring his own patients to this or that special surgeon or hospital when once he felt that the other surgeon had got a little ahead of him. "I gave up doing ovariectomies, both in public and private, and used to transfer my patients from the London to the Samaritan Hospital." And again: "I determined that I would not do litholapaxy *proprie manu* again, but that I would watch its results in the hands of a specialist friend. From that date onwards I have always transferred the patient to my friend."

How many surgeons do this? What young surgeon nowadays sends away his private patients when he has any? It is true that as a rule they are gone to the specialist already, without giving him even the melancholy pleasure of sending them. But how should he learn his business or earn his living at this rate? And, as regards the transference of hospital patients, this, now that every hospital has its own special departments, is no longer possible save in secrecy and at the risk of the condemnation of his colleagues; and in country practice it is by no means always the best thing that the patient should be sent up to town.

Mr. Hutchinson claims too much for specialism. He attributes the abolition of suppuration after extraction of a cataract to the establishment of ophthalmic surgery as a speciality, but now, since Lister came, we can all of us abolish suppuration. He speaks of "personal specialists," but one or two of those eminent surgeons whom he names would be very unwilling to be considered as specialists.

But, having ventured to make these criticisms, we have nothing left but sincere gratitude to Mr. Hutchinson for his address. Though it may have seemed at first hearing mostly a retrospect and an estimate of things surgical only, yet it was really an earnest—even a passionate—appeal to his hearers to undertake no case beyond their experience; to put the patient before the surgeon; to put surgery before self. And, whatever we may think about specialism, to such precepts, illuminated by the good example of a great surgeon who did thus honour his art, and sacrifice his own gain for the good of his patients, we say Amen! with our whole heart.

THE ANNUAL MEETING.

On Monday evening Sir Russell Reynolds entertained at a private dinner at the Buckingham Palace Hotel about a hundred guests, including many members of the Council of the British Medical Association, the Presidents of Sections of the annual meeting, and, among others, Sir Richard Quain, Sir William Broadbent, Sir George Humphry, Sir Alfred Garrod, Sir Henry Thompson, Mr. Christopher Heath, Professor Philipson (Newcastle), Mr. Ernest Hart, Dr. W. M. Ord, and Professor E. A. Schäfer.

On Tuesday afternoon a service was held at St. Paul's Cathedral, which was attended by a very large number of members and their friends. The sermon was preached by the Archbishop of Canterbury, who chose his text from Revelations xxi, 1: "He showed me a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb." Referring to the meeting of the Asso-

ciation, the reverend prelate said that assemblies of that kind were not mere compliances with the use and vogue of the day, but were practical instruments for the extension and expansion of ideas, and the mutual consultation was good both for the physician and for the patient. The doctor was a watcher of the river of life from the time that it burst forth up to where it plunged underground, and was lost to sight in the dread caverns, which swallowed, but destroyed not. Every drop or particle of the river of life apparently lived by itself, and every individual life had perplexities, disquietudes, restlessness, and forebodings, of which the physician had no cognisance, troubles unrequitable and inexplicable to others that perhaps affected all his energies, life, and being. All these nervous troubles tended very strongly to point out the oneness and the loneliness of life. Disease was not born of life, and was not essential to it; it was an accident of it, but it was an accident that was always present. It was an impressive fact that the most immediate cause of the largest portion of disease was traceable to morals, and that the worst and most grievous sufferings were those which sprang from mental and moral anguish. Referring to the objection that had hitherto been held to some extent, and which was even now held by some people, against the adoption of secular remedies for the prevention and cure of epidemics and the results of immorality, the reverend prelate said that it had long been a conviction of the Church that there was no spiritual doctrine which had not its counterpart in human life. Some people even now held that anesthetics were contrary to Divine law, but all those things were truly in accordance with it. The physician had a great responsibility as the watcher of life. Sympathy and reverence were the attributes of the watcher, and the influence of the profession was unbounded.

On Wednesday morning at King's College the staff of the West London Hospital gave a demonstration of clinical cases of interest. Mr. Keetley showed a number of cases in which operations had been performed to rectify bony deformities, including a case in which excision of the knee had been performed twelve years ago, the first in which the operation was performed by a perpendicular incision dividing the patella, a case of open division of the sternomastoid for torticollis, a case of section and excision of a coil of small intestine without removing it from the abdomen, and a case under treatment for restoration of the nose. Dr. Dawtrey Drewitt showed an example of disease of the lateral columns of the cord, and Dr. W. A. Turner a striking case of Brown-Séquard's paralysis. Mr. Bidwell showed a patient who had undergone resection of the ilium by Maunsell's method, and a case of lupus treated by excision and Thiersch's skin grafting. Mr. McAdam Eccles demonstrated some interesting cases of hernia, and Mr. H. Lloyd-Williams some models illustrating the treatment of fracture near the angle of the lower jaw. Mr. Swinford Edwards also exhibited some cases, and Dr. Phineas Abraham exhibited a number of interesting cases of skin disease, including an instance of good result following tuberculin treatment, as well as an example of Raynaud's disease with mitral stenosis, and a patient of feeble development benefited by thyroid treatment.

During the meeting most of the hospitals in London have offered special opportunities for visits of inspection by members attending the annual meeting. Thus at St. Bartholomew's Hospital, at King's College Hospital, the London Hospital, St. George's Hospital, St. Mary's Hospital, the Royal Free Hospital, the Great Northern Hospital, the West London Hospital, the Victoria Hospital for Children, St. Peter's Hospital, the National Hospital for the Paralysed and Epileptic (Queen Square), Queen Charlotte's Lying-in Hospital, the General Lying-in Hospital, and the Royal

Hospital for Diseases of the Chest, members of the Association have been admitted to attend the practice of the hospital, and to see the wards, laboratories, and museums on each day. The Mile End Infirmary and the Shoreditch Infirmary were also open for inspection. On Thursday afternoon a large number of cases of interest were demonstrated by the medical and surgical staff of Charing Cross Hospital. On Wednesday afternoon the Middlesex Hospital received members wishing to inspect it, and on Thursday morning Dr. Pringle gave a demonstration of rare diseases of the skin. On Thursday afternoon the treasurer and staff of St. Thomas's Hospital gave a garden party, and many cases and objects of interest were shown to members of the Association. On Wednesday morning Mr. Malcolm Meilard explained his method of artificially maturing immature senile cataract by trituration, at the Royal Eye Hospital, Southwark. The members of the medical staff of the City of London Hospital for Diseases of the Chest, Victoria Park, received the visits of members of the Association on Wednesday afternoon. Clinical demonstrations were given on Tuesday and Thursday morning, at Bethlem Hospital, and on Thursday afternoon at the Lock Hospital. Members were admitted to see operations at the City Orthopaedic Hospital on Tuesday, and on Wednesday afternoon a special demonstration was given by members of the staff of the Hospital for Diseases of the Throat. On Wednesday afternoon Dr. Koch was in attendance at the Hampstead Union Infirmary, to show the new circular wards and other objects of interest. On Thursday afternoon, at the Kensington Infirmary, Dr. Potter showed the maternity department, the new buildings, and the nurses' home, and demonstrated some cases of interest. On Thursday afternoon, an At Home to 100 visitors was given at the New Hospital for Women.

In the Great Hall of St. Bartholomew's Hospital on Wednesday, July 31st, after the rising of the Sections, the medical and surgical staff of the hospital entertained upwards of 200 members and distinguished guests of the Association at luncheon. This, one of the most agreeable of the subsidiary functions of this annual meeting, was presided over by Mr. Thomas Smith, the senior member of the staff of the hospital, who was supported by the majority of his colleagues, including Dr. Andrewes, Sir Dyce Duckworth, Dr. Gee, Mr. Willett, Mr. Langton, Mr. Butlin, and Dr. Hensley, and by the Treasurer, Sir Trevor Lawrence, F.R.C.S. Mr. Thomas Smith, after the usual loyal toasts had been suitably honoured, proposed "The Health of the Guests," and recalled to them that for eight centuries St. Bartholomew's Hospital had occupied its present site, and that it had always been, from its first foundation, a hospital dedicated to the cure of disease and the relief of suffering. He recalled some of the great names which had been associated with the medical and surgical work of the hospital in the past, and pointed out the portraits of many of them on the walls of the Great Hall of the hospital in which the luncheon was given. He expressed his regret, which was shared by all present, that Sir James Paget had found himself unable to be present, and read the following sympathetic letter from Sir James Paget:

I am very sorry that I cannot be at the luncheon at St. Bartholomew's with you and all who will be there, including many of my oldest and most esteemed friends and pupils. But the great sorrow in which this year began, and the rather heavy work that in its course I have had to do, have made me quite unfit for either the pleasures or the business of the meeting of the British Medical Association, and have obliged me to take my summer holiday earlier than usual. I must have rest; but I will make a guess at your luncheon time on the 31st, and will set my mind to think of St. Bartholomew's, and all the happiness that I owe to it, and will wish health and true happiness to you and all with you.

The toast was acknowledged by Professor Clifford Allbutt (Cambridge), who expressed the thanks of the guests for the generous hospitality extended to them in the historic building in which they were assembled, and by Professor Stokvis (Amsterdam), who, in the name of the foreign

guests, expressed a similar sentiment, and, speaking in excellent English, added some observations on the history of St. Bartholomew's, which he said reflected the evolution of medical science. He recalled the fact that the great Harvey had served within its walls, and dwelt on the debt which medicine owed to England for the establishment of the system of trained nurses. Mr. Christopher Heath, the President of the College of Surgeons, also responded, and recalled the fact that St. Bartholomew's Hospital had given many Presidents to the College of Surgeons, and the farther fact that at the present time its five surgeons were all members of the Council. Mr. Thomas Smith then called upon Surgeon-Captain Whitechurch, who, with his Chitral honours fresh upon him, received a splendid ovation from the company. Surgeon-Captain Whitechurch responded very modestly, saying that, next to the honour of receiving the Victoria Cross, he esteemed that which he had received that day. Professor Macowen (Glasgow) then in the name of the Guests proposed the toast of "St. Bartholomew's Hospital," coupled with the name of Mr. Thomas Smith, who, in a brief reply, referred to the pains at which Dr. Norman Moore had been to prepare a historical account of the hospital, a bound copy of which was presented to each guest. He expressed his regret at the absence of Sir Joseph Lister, who, he said, had requested him to state that he had been prevented from taking part in the proceedings of the annual meeting of the British Medical Association, and from being present at St. Bartholomew's only by his recent domestic bereavement. In addition to those whose names have already been mentioned, there were present Sir Spencer Wells, Sir Trevor Lawrence, Sir Alfred Garrod, Dr. Ward Cousins, Sir F. Abol, Dr. Smyly, Dr. Bowditch, Mr. Mitchell Banks, Sir George Humphry, Professor Michael Foster, Dr. Donald MacAlister, the Presidents of Sections, and other officers of the Association. As the guests were separating, Surgeon-Captain Whitechurch was seized upon by the students, and chaired round the quadrangle, amid the cheers of a large number of students, nurses, and patients.

This little book which Dr. Norman Moore had written as a gift to those who attended the luncheon at St. Bartholomew's Hospital is entitled, *A Brief Relation of the Past and Present State of the Royal and Religious Foundation of St. Bartholomew's Hospital*. It is a small octavo of 60 pages, opening with a very appropriate argument quoted from *Utopia*. The first chapter deals with the patron of the hospital, St. Bartholomew; the second with the founder, Rahere, who made his foundation in Rome in 1120, and carried it out at Smithfield in 1133. The third chapter relates the history of the hospital and its constitution; the fourth recalls some memories of its physicians and surgeons, while the fifth and last describes the present aspect of the hospital, and some of the interesting historical objects within its walls.

On Monday evening Sir William and Lady MacCormac received a large number of members attending the annual meeting and ladies at the Royal Institute of Painters in Water Colours, Piccadilly. On the same evening Mr. and Mrs. Ernest Hart gave an "at home," chiefly to foreign and provincial members, at which Mr. Mercer Adam, who was a member of the medical before he joined the dramatic profession, gave a musical recital, which recalled the manner of the late Mr. Corney Grain; and among the amusements provided for the numerous guests was the telephone, which was in communication with the opera, and with various theatres in London, and a series of medical portraits which are being painted for Mr. Hart of his most eminent contemporaries and friends by Mr. Solomon J. Solomon. On Thursday evening Dr. and Mrs. Stephen Mackenzie gave an evening party, which was very largely attended; but to enumerate all the hosts who offered liberal hospitality would be impossible, but we believe that London has lived up to its reputation, and has

done something to show its grateful appreciation of the great kindness shown at the provincial and other centre visited by the Association in former years.

Among the various pleasant reunions which have characterised the London meeting of the British Medical Association, one of the most delightful was the illuminated evening *fête* at the Gardens at the Royal Botanic Society. The beautiful gardens in Regent's Park were brilliantly illuminated, there was music everywhere, and the weather was perfect. In the large conservatories and on the extensive lawns there was ample space for promenading, and although the *fête* was attended by a large number of members, both of the British Medical Association and of the Geographical Congress now in progress, there was no overcrowding. The Duke and Duchess of Teck arrived about 10 o'clock, and were conducted to a reserved enclosure in front of the great conservatory. The bands of the 1st Life Guards and Royal Horse Guards performed on either side of the Gardens, and the Ladies' Pompadour Band in the conservatory.

On Tuesday evening, after the delivery of the Presidential Address, the members and their lady friends were entertained by the Metropolitan Counties Branch at a *soirée* in the Imperial Institute. The reception commenced at 8.30, and at 9 the President delivered his address, after which there was a *conversazione* in the gardens of the Institute. The night was fine and warm, so that members and guests could move about with perfect freedom in the grounds. To those who had never seen the grounds illuminated as they were on this occasion the scene was gay and attractive and most enjoyable. Excellent music was provided, both the Strauss Orchestra, under the conductorship of Herr Strauss himself, and the band of the West London Rifles being present. The refreshments were admirably arranged, and indeed the comfort of guests was most carefully attended to in every way. Altogether the metropolitan members may be congratulated on the success and brilliance of their entertainment, and it will be satisfactory to them to know that we have been assured by many of their guests that it was much appreciated and admired.

A SMALL party, including Dr. Pistor of Berlin, and the medical officers of health for Leeds, Salford, Blackburn, and Crewe, paid a visit on Wednesday afternoon to the model lodging house erected by Lord Rowton nearly three years ago. The party were met by Lord Rowton, who personally explained the causes which led to the building of Rowton House, and subsequently conducted the party throughout the whole of the premises. All were very much impressed by the cleanliness and order of the house and the excellent arrangements made for the comfort of the inmates. Lord Rowton's kindness was very heartily appreciated by every member of the party.

THE Director of the British Institute of Preventive Medicine, Dr. M. Armand Ruffer, gave a demonstration, on Wednesday, of the methods used for the preparation of curative serums, at the Institute's farm at Harrow; and on Thursday a special demonstration was given to the members of the Public Health Section. He began by saying that the history of bacteriology might be divided into three periods: The first period was that of Pasteur and Lister, in which the importance of bacteria as disease-producing agents was first ascertained, and included the discovery of the antiseptic treatment of wounds by Lister, and the methods of prophylactic inoculations by Pasteur. The second period was characterised by the work of Koch on the isolation of specific microbes producing disease; and the third period was remarkable for the discovery by Behring of the wonderful therapeutic properties of the blood of immune animals. His remarks would be limited on this occasion to the technique of the preparation of the serums used in therapeutics without entering into theoretical considerations or

into the question of their practical utility. This last part of the subject he must leave entirely in the hands of clinicians, who alone could give an answer. He would begin by the preparation of the serum for the cure of diphtheria. Dr. Ruffer then showed the methods for the preparation of toxins and various kinds of flasks for the production of powerful toxins. The mode of sterilising cultures by filtration was fully entered into, as also the mode of inoculating horses. Three horses were shown: the first was inoculated before the audience, the second was at the height of the reaction six hours after the inoculation, and the third had been inoculated the day before. Dr. Ruffer pointed out that although these three horses had been repeatedly inoculated and bled, they showed no signs of fear or pain, and contentedly munched whatever tit-bit was offered them. The method of bleeding aseptically was then demonstrated, together with the way of filtering, bottling, and packing the serum. It was pointed out that by improved apparatus the serum only once came into contact with unfiltered air, and only for a very short period of time. An apparatus was shortly to be constructed, by means of which the serum would not come into contact with air at any time, that is, from the time it left the horse's vein until the bottle was opened for the treatment of the patient. The method of ascertaining the strength of the serum was explained, and the discrepancies noticed by various observers were fully entered into. Dr. Ruffer further pointed out that horses sometimes lost their antitoxic powers, so that it was necessary to test their serum from time to time. Passing to tetanus, the lecturer said that the method of immunisation of horses against that disease was practically the same as that against diphtheria. He demonstrated incidentally the excellent apparatus used by Dr. Hewlett for the culture of anaerobic micro-organisms. Two horses immunised against tetanus and yielding serum of high therapeutical properties were exhibited. Reverting to diphtheria, Dr. Ruffer pointed out that many observers had noted the extreme gravity of the cases in which the diphtheria bacillus was associated with the streptococcus pyogenes. It had struck him that were it possible to immunise horses against both diseases, the serum would possess much higher curative properties, as it would be active against both pathogenic organisms. With the assistance of Mr. Robertson, he had therefore immunised two horses against diphtheria, and then immunised them against the streptococcus pyogenes as well. Moreover, he had immunised another horse against the streptococcus pyogenes alone by the following method: It was known that the streptococcus pyogenes did not form strong toxins in the media in which it grew, and hence it was necessary to use living cultures. The difficulty connected with this method, however, consisted in the fact that streptococci soon died out in artificial culture media, and soon lost their virulence. But, by using appropriate media and making fresh cultures every twenty-four hours at least, good cultures could be obtained. The horses were first inoculated with $\frac{1}{2}$ c.c.m. of a culture twenty-four hours old. A slight swelling arose which disappeared in a few days, and the accompanying fever lasted a short time only. After a week or so 1 c.c.m. of culture was injected, and week by week the dose was increased until a horse could stand 100 c.c.m. without any more discomfort than a local swelling and rise of temperature. In no case had they ever produced an abscess, but large doses, even when frequently repeated, always produced a local reaction and fever, the difference from what was the case in diphtheria being most striking. He would leave the discussion of the therapeutic value of this serum until it had been tried in appropriate cases by distinguished clinical observers. He would point out, however, that on the Continent Roger had cured seven out of eight cases of severe puerperal fever by means of serum prepared in Bouchard's laboratory. Without wishing to claim any priority in the matter, Dr. Ruffer pointed out that Roger's

method had not, as far as he was aware, ever been published. Another horse had been immunised by the same method against streptococci isolated from cases of erysipelas, and, as those present could observe, the animal was in perfect condition. It was probable, moreover, that horses immunised against the streptococcus pyogenes were also immune against the streptococcus erysipalatis, as he believed that the two organisms were identical for all practical purposes. Finally, Dr. Ruffer referred to recent work which had been done at home and abroad on the same lines against cholera, tubercle, and pus organisms. The visitors then went into the laboratories, stables, animal houses, etc., and had every opportunity of seeing that the horses and other animals were carefully attended to and in perfect condition.

Among the many festivities and hospitalities which have taken place during the meeting of the British Medical Association mention should be made of the dinner of the British Gynecological Society, which took place in the Whitehall Rooms at the Hôtel Métropole on Wednesday, July 31st. The chair was occupied by the President (Dr. Clement Godson), and many eminent foreign and provincial guests were hospitably entertained.

The number of members who, up to 1 p.m. on Thursday, August 1st, had entered their names on the register as attending the meeting was 2,750. The number of visitors is 180, so that the total attendance is 2,930.

A small party of members, including Dr. Alfred Hill (medical officer of health to Birmingham), Dr. Oldright (Canada), Dr. Groves (Isle of Wight), and others accepted the invitation of the Corporation of London to inspect the markets and abattoirs at Deptford. The party was met by the market superintendent (Mr. Philcox), who spared no pains to explain the methods followed to protect the enormous meat supply which passes through this market. The visit was to the landing stages, of which there are three. It is possible to empty a ship of upwards 600 beasts in twenty minutes. The cattle, which have already undergone inspection at port of loading, are penned for preliminary inspection by an officer from the Board of Agriculture; after this they are penned in salesheds and examined more carefully. In case of any doubt the beast is slaughtered specially, and more completely examined. After sale the beasts are slaughtered, and the carcasses and organs examined. No animal is allowed to leave the yard alive, and no dead meat can be removed until certified sound. Tubercle to a slight amount does not involve destruction of the whole carcass. The two inspectors of the Board of Agriculture are veterinary surgeons. There are gut-cleaning works on the premises, and tripe dressing is done here also. New works are in progress to erect hanging rooms where dressed carcasses may be stored after killing, in lieu of hanging them in the slaughter house.

Mr. Sidney Young, F.S.A., Master of the Barber-Surgeons Company, received upwards of one hundred visitors interested in medical antiquities at the Barber-Surgeons' Hall on Wednesday. The company was received in the drawing-room of the Hall, and afterwards adjourned to the Court room, where Mr. Young had caused the numerous objects of interest possessed by the Company to be displayed to the best advantage. Mr. Young explained in the most interesting and impressive manner the relationship of the barbers to the surgeons, and pointed out that the Company which he then represented were really the pioneers in England of technical education. At the conclusion of his address a vote of thanks was proposed by Dr. Norman Moore and seconded by Mr. Henry Power, as representatives of the two sides of the medical profession. It was carried by acclamation, and a most interesting meeting thus terminated.

A LARGE number of ladies and gentlemen, members of the Association, were received by the Chairman of the Council of the Sanitary Institute (Mr. A. Wynter Blyth) on Wednesday. Among the members of the Council present were Sir Douglas Galton, Mr. Rogers Field, Mr. Cutler, Dr. Newsholme, and Mr. White Wallis, secretary. The veteran sanitary engineer, Sir Robert Rawlinson, was also present. Mr. Wynter Blyth opened a discussion on The Teaching of Hygiene as illustrated by the Parkes Museum. He stated that it was founded in 1876 in memory of Professor E. A. Parkes, at first a separate institution, it found a temporary home at University College, but was removed to the present quarters in 1882. Four years afterwards it was incorporated with the Sanitary Institute. The purpose of the museum is to form a collection of object lessons, illustrating the development and recording the progress of sanitary science. No fewer than 20,000 persons annually visit this collection. During the last nine years systematic instruction has been carried on within its walls; besides the elaborate courses of lectures given under the auspices of the institute, no fewer than forty-eight different colleges, medical schools, or societies have during the present year sent their students, the number of students reaching not far short of 1,000. Mr. Wynter Blyth then detailed the classification of the museum, and showed one or more specimens from each class. He called particular attention to a new model illustrating the flow of subsoil water presented and designed by Mr. Wallace Peggs. A series of wells are in line in a large tank filled with sand. The sand being saturated with water, a pump fixed to the centre well and put in action causes the water to sink in the wells right and left of the centre in a more or less mathematically accurate curve. Mr. Wynter Blyth concluded his address by laying stress on the technical utility of such a museum and the real use it was to architects, builders, and plumbers, besides mere students. He had shown how with inadequate resources in a modest building far too restricted in size to do justice to the subject, the Institute had maintained without any State assistance this museum and that it had proved to be of the utmost assistance in the diffusion of theoretical and practical knowledge of hygiene. The audience afterwards minutely inspected the objects in the museum, the Curator and members of Council demonstrating the use and purpose of the various exhibits.

The Honorary Librarian has much pleasure in acknowledging from Sir Joseph Fayrer, K.C.S.I., a collection of reports, transactions, and papers, which he has kindly sent as a gift to the library.

The new Home—the Passmore Edwards House—of the National Society for the Employment of Epileptics, at the Colony, Chiswick St. Peter, Bucks, will be opened by the Duke of Devonshire on Wednesday, August 7th, at 4.45 p.m.

We regret to announce the death of Sir John Tomes, F.R.S., F.R.C.S., the well-known dental surgeon, who passed away on July 25th at the age of 80. A fuller notice of his distinguished career is unavoidably held over till next week owing to the exceptional pressure on our space caused by the meeting of the British Medical Association.

TESTIMONIAL TO SIR JOSEPH LISTER.

On July 31st Sir Joseph Lister was presented on his retirement from King's College Hospital with a portrait of himself painted by Mr. J. H. Lorrimer. The presentation was made by his past colleagues and pupils as a mark of the esteem in which he is held. The chair was occupied by Dr. W. S. Playfair, and among those present were Sir John Erichsen, Sir George Humphry, Sir George Johnson, Sir Grainger Stewart, Sir William Stokes, Professor Gairdner,

Professor MacCewen, and Professor Finlayson, of Glasgow; Professor Chiene, of Edinburgh; many members of the staff of King's College Hospital, and many former pupils. The Chairman said that that presentation must not be considered as a recognition of the great work accomplished by Sir Joseph Lister for humanity, a work which at some, he hoped, no distant date would call not indeed for national but for international recognition. The presentation was made merely as a small personal recognition of the affection and esteem entertained for him by his old friends, colleagues, and pupils. Sir John Erichsen, in making the presentation, referred to the enormous progress which had been made in surgery, mainly owing to the introduction, and appreciation by the profession generally, of antiseptic surgery, a boon which had made Sir Joseph Lister one of the greatest benefactors of mankind. Through it the after-treatment of wounds had been rendered no simple as to be almost painless, and so safe that the mortality from septic disease had been almost extinguished. It was not unfeeling, Sir John Erichsen added, that he should have been selected to make the presentation, for Sir Joseph Lister had formerly been his pupil. That relationship had now, indeed, for twenty years been reversed, and the master had been content to sit at the feet of his former pupil. Sir Joseph Lister, who was very warmly received, sketched the steps which had led him to enunciate the theory of the antiseptic treatment of wounds. He had suspected that the septic diseases to which patients were liable after operations were due to some kind of fungus, and Pasteur had demonstrated that they were due to microbes. The success which had attended the early application of the theory to practice had been such that he had been able to convert certain surgical wards, previously notorious for the amount of disease which prevailed in them, into the healthiest in the world. He hoped that surgeons in this country would not be misled by the somewhat fascinating idea of aseptic dressings, for the very nature of some cases rendered it impossible that these should replace antiseptic dressings. It had been to him one of the chief joys of life to impart to students the principle of the noble and beneficent art of surgery, and he was extremely gratified by the testimonial which had been presented to him that day, proving, as it did, that his efforts had not been altogether in vain.

PASTEUR FILTERS AT DARJEELING.

THE absolutely dependable filtration of water in India is a matter of vital importance, for the investigations of bacteriologists have proved beyond a doubt that cholera and typhoid, and most probably dysentery and malaria, are due to specifically contaminated water. There is an overwhelming body of evidence, scientific and official, that the Pasteur-Chamberland filter successfully filters off the germs. To introduce its use universally into India would be markedly to lessen the mortality from waterborne diseases. It is, therefore, very interesting to learn that the Commissioners of Darjeeling have arranged to introduce these Pasteur filters into their water mains. This, it is stated, is the largest single installation and the first application of the filter system to a town supply; and it will be a great and life-saving measure if the enlightened example of the Darjeeling Commissioners be followed all over India and in the barrack hospital establishments and garrisons of that empire. These filters have stamped out typhoid in the French army.

OPHTHALMIA AT CHESTER WORKHOUSE.

For some months past this disease has been prevailing among the children at Chester Workhouse, and the guardians decided to communicate with the Local Government Board, which body sent one of their medical officers to examine and advise. On July 23rd, at the Board of Guardians, Dr. Fuller reported that it was necessary to have better accommodation for the children, and that they needed other open air exercise than that to be obtained in the workhouse yard.

where the dust only added to the irritation of the eyes. He mentioned a case in London in which it cost a Board of Guardians £7,000 to stamp out an epidemic of ophthalmia through not taking proper precautionary measures at the outset. It was decided to carry out Dr. Faller's recommendations forthwith. These included the hire of a playfield for the children, the employment of a separate nurse for the ophthalmic patients, the provision of well-ventilated wards for them, and a stimulating diet for the whole of the children in the house during the continuance of the disease.

FRENCH PEAS À L'ANGLAISE.

SOME years ago we gave notes of the proceedings of a Committee appointed by the National Health Society, primarily in connection with the use of arsenical colours in wall papers, but which soon extended its scope so as to include the employment of poisonous pigments generally under all circumstances in which they constitute a source of danger to health, and drafted a Bill for regulating their use. For this purpose Mr. Ernest Hart obtained, through the courtesy of the Foreign Office and its consular agents copies of the laws in force in Germany, Austria-Hungary, Sweden and Norway, Denmark, Holland, Belgium, Italy, and Switzerland bearing on the subject, which, translated by Dr. E. F. Willoughby, the Secretary of the Committee, were published as a Parliamentary paper. The Bill shared the fate of most of those introduced by private members—it was read a first time and shelved. Ten years have since passed by and nothing has been done. Great Britain still maintaining the same attitude of indifference as Spain, Portugal, Russia, and Greece, since even the Danubian States have adopted the German or Austrian regulations. France, however, held, and still holds, the unique position of a Government, which, while exercising a certain care over the health of its own people cynically ignores or exempts from interference the employment of poisonous pigments in articles of food or domestic use intended for exportation, that is to countries which, like ours, are willing to accept them. Foods alone are subjects of legislative control among ourselves, if, indeed, the occasional seizure of a sample and the infliction, still more occasionally, of a paltry and quite insufficient fine merits such a description. It is notorious that the preserved peas and other green vegetables so largely imported from France are coloured with copper salts, but it has been constantly urged in extenuation that the quantity employed is too small to exert any toxic or injurious action. But since it has been shown in a report of a subcommittee of the Glasgow Corporation that some samples of peas examined contained no less than 15 grains of copper sulphate in the pound this position cannot seriously be maintained. Indeed the dangerous character of such admixture is admitted by the French Government and manufacturers, since they are illegal in that country and are designated in the trade as *poils à l'Anglaise*. May we be so sanguine as to entertain the hope that the present Government may be induced to take up a question of such importance as one of the social reforms which will engage its attention?

MEDICAL MEN IN THE NEW PARLIAMENT.

THE returns of the elections show that there are but few members of the medical profession in the new Parliament. Sir Walter Foster, so long a warm champion of medical interests in the House, has again been returned for the Ekeston division of Derbyshire; and the electors of East Norfolk, despite that their suffrages were ardently wooed by Mr. Rider Haggard, have again returned Mr. R. J. Price. As, however, Mr. Price is a barrister and does not practise as a surgeon, he can only count as half a representative of the profession, unless, indeed, the eloquence acquired by practice at the bar entitles him to be considered as the more qualified to speak on behalf of his earlier love. Scotland

again gives us two representatives in Dr. Farquharson, the Liberal member for West Aberdeenshire; and Dr. Clark, the member for Caithness-shire, who, though opposed by "a Crofter candidate," has had as good crofter support as ever, and should, politics apart, continue to be a guardian of medical interests, which, like Dr. Farquharson, he so well understands. Ireland contributes relatively the largest contingent of medical members. She again sends Dr. J. F. Fox as the Nationalist representative of the Tullamore Division of King's County; Dr. Tanner, as the Nationalist member for the mid division of Cork County; Mr. M. A. MacDonnell (formerly surgeon to the Liverpool Cancer and Skin Hospital, and consulting medical officer to the Toxteth Infirmary) as member for Queen's County (Leix Division); and Mr. R. Ambrose, this time as member for West Mayo.

THE DANGEROUS CONTAMINATION OF OUR EVERYDAY MILK SUPPLY.

THE third of the series of special reports on the London Milk Supply, which appears in the current number of the *BRITISH MEDICAL JOURNAL*, contains some very valuable and interesting material, of importance not only to those engaged in catering for our daily supply, but also to every one of us who daily consumes this important article of food. In the course of a bacteriological examination, which has been made at the request of the Editor, by Mr. Sydney Rowland, it appears that the dangers to be feared from milk are not so much the graver one of epidemic disease, although this is a frequent and serious danger, as the daily risk all milk drinkers run from the large number of micro-organisms found. These are for the most part such as would be derived from the use of dirty utensils and unclean surroundings. Thus the particular organism which is found in greatest abundance is the bacillus coli communis—the common inhabitant of all sewage matter. The average number of micro-organisms found rises as high as 500,000 per cubic centimetre, of which 90 per cent. consist of this variety. There can be no doubt that this form finds its way into the milk from the unclean bodies of the cows, and from the polluted air of the stables and stalls in which the milking is too often carried on. In addition have been found many organisms which, although of wide distribution, nevertheless have no right to exist in milk as used for food. Such are the common varieties that cause putrefaction. The significance of the bacillus coli communis is daily becoming more important, and its determining action in many cases of infantile diarrhoea is now certain, not to mention many intestinal diseases and summer complaints which are of frequent occurrence. The suggested reform, which it is thought would largely if not altogether safeguard against these everyday dangers, would not be difficult to put into practice, and ought to be enforced by legislation. Thus it is suggested that milking should be carried on in the open air, a precaution which every dairy farmer could easily carry out. In fact, all the suggested remedies point in the direction of absolute cleanliness, not only in the milking, but also in the subsequent conveyance to and acquire in the shop of the retail vendor. It is not too much to expect such very easily adopted means to be carried out, or if necessary enforced, more especially, as the author points out, such precautions would have an equally salutary effect in times of epidemic disease of serious gravity.

CHOLERA.—The Turkish pilgrims have just left Tor after having been disinfected and having undergone fifteen days' quarantine. A necropsy on two pilgrims who died during the passage from Jeddah to Tor showed anatomical lesions of true cholera, and bacteriological examination showed that these were authentic cases. These are the only cases reported, but have resulted in the enforcement of the quarantine regulations in all their severity, including the disinfection of all baggage. As the sanitary state of Medina is satisfactory, pilgrims travelling from Medina to Yambu will only have to undergo four days' observation.

BRITISH MEDICAL ASSOCIATION.

SIXTY-THIRD ANNUAL MEETING.

THE SECTIONS.

BRIEF SUMMARY OF PROCEEDINGS.

Wednesday, July 31st.

In the following pages we present a series of brief notes indicating the general character of the proceedings in the Sections. These have been furnished to us by our reporters in the various Sections, with the kind co-operation of the Honorary Secretaries of Sections. Fuller reports of the proceedings, together with the original papers read, will be published in later issues of the JOURNAL.

SECTION OF MEDICINE.

THE President, Dr. Pavy, opened the proceedings in this Section by an address, in which he described the progress in medicine due to the discovery of the causal relationship existing between micro-organisms and certain diseases, enlarging upon the immense effect that this had had upon the question of treatment, and upon the control that could be exercised upon the spread of infectious diseases. He briefly touched upon the serum treatment of diphtheria. The theatre rapidly filled whilst the President was speaking, and by the time Dr. Sidney Martin rose to introduce the discussion on Diphtheria and its Treatment by the Antitoxin the place was crowded with an audience which, throughout the subsequent debate, showed the keenest interest in the proceedings. Dr. Martin commenced by stating that there had always been two schools of therapeutists with regard to the treatment of diphtheria, the one trying to discover some local application which would loosen or remove membrane in the throat, and the other to provide a remedy that would act upon the general symptoms of the disease. The want of success in the past made it essential, in his opinion, to examine most carefully into any new method of treatment suggested, and to submit it to a most rigid scientific inquiry before accepting it. The antitoxin treatment, he stated, had been studied with the greatest care, and its recommendation was based upon the results of a consideration of the pathology of the disease. He showed a series of charts which brought out the following facts in the most striking manner. Intravenous injection of toxin of diphtheria in successive doses into rabbits caused the temperature to become irregular, with wasting, paralysis, and finally death of the animal; the intravenous injection of antitoxin alone caused but little result upon the body temperature, and no loss of weight—in fact, seemed to be innocuous; the intravenous injection, however, of toxin and antitoxin at the same time resulted in the almost complete absence of the symptoms set up by the toxin alone, the only harmful effect being slight nerve degeneration. Dr. Martin next described the effect of the intravenous injection of albumoses obtained from the spleens of patients dying of diphtheria alone, and of these albumoses together with antitoxin. Finally he emphasised the very great importance of the fact that in animals subjected to the antitoxin treatment there was absolutely no sign of fatty degeneration of the heart, and that hence it might be expected that in the future there would be fewer diphtheria patients dying from heart failure. Dr. E. W. Goodall spoke on the clinical aspects of the serum treatment, and expressed himself as of opinion that it is the best form of treatment we have. The discussion was continued by Dr. Johnston (Glasgow), who gave some interesting statistics; but by this time the meeting was beginning to become less enthusiastically than it

had been. However, the next speaker, Professor von Ranke (Munich) quite galvanised his audience into new life by the fervid support he gave to the serum treatment. He stated that whilst in 1892 he had in his hospital a mortality of 56.2 per cent., in 1893 of 46 per cent., and in 1894 up to September 24th, when he had commenced the serum treatment, one of 57 per cent., since that time his death-rate had been reduced to 17.7 per cent. He further considered that not only was the reduced death-rate due to the injection of antitoxin, but that the course of the disease was favourably influenced in the most striking manner. Dr. Ranke was followed by Mr. Lennox Browne, who traversed some of the statements made by previous speakers, but did not add much to what he has already published upon the subject. Professor Baginsky, of the Empress Frederick Hospital, Berlin, though not speaking with the high enthusiasm of Dr. Ranke, yet gave equally startling figures, stating that whilst the mortality in the four years previous to 1895, had been on the average 41 per cent. under the old system of treatment, during the last year, under the serum treatment it had been reduced to 15.6 per cent. Dr. Sims Woodhead spoke briefly upon the importance of using large doses of serum, and concluded by quoting some Paris statistics which were highly favourable. Dr. Hermann Biggs (New York) then gave a most interesting account of the immunising effect of the serum, quoting figures to show that in almost all cases the immunising power of the serum extends to a period of thirty days. He further stated that out of 800 healthy children who had received injections, he had not seen a single case in which any harm had resulted from the treatment. The discussion, which had been marked by the extreme interest manifested in the subject by the members present, was brought to a close by Mr. Campbell Hall, who as the result of his experience stated that he would not feel justified in treating a diphtheria patient in any other way than by the serum method as long as serum could be procured. Dr. Dreschfeld next read his paper upon Ataxic Paraplegia. This and the following paper by Dr. Beevor and Professor Horsley did not give rise to any discussion. Dr. George Murray then read a paper on Myxœdema and Thyroid Extract, which gave rise to some remarks. This was followed by a paper by Dr. Samuel West, in which the value of uranium nitrate as a drug for the treatment of diabetes was considered with great care, and the conclusion arrived at that it is the most powerful drug we possess in this disease. Professor Hanot read a most interesting paper upon *Diabète Bronzé*, in which he described a condition that as far as we know has not been previously mentioned in this country. Mr. Colin Campbell spoke briefly upon the value of Intrapulmonary Medication, his remarks giving rise to a discussion in which Mr. Hollwright, Dr. Murray Leslie, and Dr. Wilberforce Smith joined.

SECTION OF SURGERY.

THE first day's proceedings in the Section of Surgery were of unusual interest. The three addresses treated of widely removed subjects, each essentially modern in its development; the discussion, on the other hand, reopened a question of very long standing, and was worthily introduced by the greatest representative of the school which has made its theme classical. Sir William Mac Cormac's Presidential address, with which the meeting opened, was a model of terse and lucid exposition, charged with the weight of authority and yet balanced with the nicest discrimination. It is published on p. 278. Sir William Stokes introduced a discussion on the Diagnosis and Treatment of Fractures of the Upper Third of the Femur. After insisting on the importance of the fibro-synovial envelope of the neck, brought forward a classification of fractures through and in the neighbourhood of the neck, based on the presence or absence of penetration or impaction. He endorsed Sir George Humphry's view that the angle between the neck and the

shaft was normally unaffected by age, and held that osseous union might normally take place in four out of the five forms of fracture of the cervix femoris. The principles of treatment which he laid down were fixation, rest, and moderate extension. A most interesting debate followed. Sir George Humphry stated his belief that a fracture in any part of the skeleton at any time of life will unite if the parts are kept in apposition. The general opinion, as expressed by Mr. Bryant, Dr. Greig Smith, Mr. Mayo Robson, and others, was that the treatment in young patients should be modified by reducing the impaction so as to obviate the deformity. Sir William Hingston (Montreal) stated that the results as regards union and absence of shortening mentioned by Sir William Stokes were much better than he was accustomed to find, and Mr. Gant said a few words on the difficulties of diagnosis. Surgeon-Colonel Keegan's demonstration on Rhinoplasty in India illustrated the excellent results which the operation he has devised gives, even in long-standing cases, when the lesion is traumatic and not the result of disease. The meeting concluded with an extremely original paper by Dr. Kendal Franka on Movable Kidney. He contends that the normal kidney is wedged in between the liver above and the intestines below, and that any disturbance of the balance between the two will, especially if repeated, draw the organ out of place. The symptoms he considers to be due mainly to the kinking of the duodenum on the right side or the colon on the left resulting from the renal displacement.

SECTION OF OBSTETRIC MEDICINE AND GYNECOLOGY.

THERE was a large and representative attendance at the meeting of the Section of Obstetrics and Gynecology, held in the Large Theatre at King's College, when the proceedings commenced at 10 A.M. Sir William Priestley's address, which is published at p. 284, was well received. A cordial vote of thanks to the President was moved by Professor Lusk (New York), seconded by Professor Martin (Berlin), and carried by acclamation. A discussion on the Aseptic and Antiseptic Precautions to be observed in Private Midwifery Practice was then introduced by Dr. Herman. A very interesting and full discussion followed, in which Dr. Stuart (Brooklyn), Professor Lusk, Dr. Smyly, Dr. Swayne, Dr. Playfair, Professor Byers, Professor Murdoch Cameron, Dr. More Madden, and others took part. A paper by Dr. Apostoli (Paris) on Electro-therapeutics as a Means of Diagnosis in Gynecology was read by the Honorary Secretary. This was discussed by Dr. Franklin Martin (Chicago). Papers by Dr. More Madden on Gonorrheal Infection in some of its Gynecological Aspects, and by Dr. Murphy (Sunderland) on The Surgical Treatment of so-called Puerperal Fever followed, and both of these excited a very full and complete discussion.

SECTION OF PUBLIC MEDICINE.

THE proceedings in this Section, which was attended by a large number of medical men in public offices, most of them holding appointments as medical officers of health over large districts, were opened by Mr. Ernest Hart, who delivered the address, which is printed at page 277. The following resolution, proposed by Dr. Grove, M.O.H. (Newport, Isle of Wight), and seconded by Brigade-Surgeon Pringle, was carried unanimously: "The Public Health Section of the meeting of the British Medical Association begs to recommend that representations be made to the Secretary of State for India as to the utter inadequacy of the present sanitary administration of the Government of India to give the most elementary protection to the public health of the inhabitants of Her Majesty's Indian Empire, and that a copy of Mr. Hart's address be forwarded to the official authorities at home and in India, requesting their attention to the points urged therein, and the appointment of a Royal Commission or of a Departmental Committee." Dr. Legg opened a discussion on the Regulation of the

Slaughter of Animals for Human Food, in which he emphasised the evils apparent in the present system. In reply to many speakers, he pointed out that there was no power at present to close private slaughterhouses wholesale either in London or provincial cities and towns. London, however, had it in its power to close any private slaughterhouses whose use was objectionable or undesirable by the non-renewal of licence. Provincial cities and towns could acquire the same powers by the adoption of the Public Health Amendment Act. In both cases the circumstances of each individual slaughterhouse had to be considered separately. In rural districts, unless the sanitary authority had obtained urban powers, there was entire absence of control over private slaughterhouses. Provincial cities and towns had, but London appeared not to have, power to erect abattoirs. On the motion of Dr. Newsholme (Brighton), a resolution was passed urging the Government to appoint a Commission to inquire into the whole question of meat supply and inspection. Papers on the same subject were read by Dr. R. S. Marsden (Birkenhead) and Dr. Sykes (St. Pancras). A discussion on Sewer Ventilation was initiated by Mr. J. Parry Laws, F.I.O., who maintained that instead of sewage being a favourable soil for the growth of typhoid bacilli, it gradually but surely exterminated them. Dr. Neech (Atherton) followed with a series of interesting experiments to show the movements of air in sewers. The subject was continued by Dr. Oldright, Dr. Davis, Dr. Haughton, Dr. Bond, Dr. Groves, and Dr. Hill. A paper by Dr. Waldo and an interesting account of Urine Experiments by Dr. G. V. Poore brought to a close a most interesting morning's work.

PSYCHOLOGICAL SECTION.

THE meeting of this Section on Wednesday was well attended. The President, Dr. Mickle, opened the proceedings with a few remarks welcoming those present, and then read his address on Abnormal Forms and Arrangement of Brain Convolutions, which was received with much applause. Dr. Rayner next opened a discussion on the Treatment of Melancholia, dwelling especially on rest, outdoor exercise, feeding, and hypnotics. He said that rest was indicated where there was loss of nutrition, but that it was harmful in many cases when combined with isolation, as in the Wel-Mitchell treatment. In other cases outdoor life, light clothing, cold baths, and regularity of meals proved most beneficial. A sea voyage or travelling was often now-a-days resorted to, but it must be remembered that there is an element of danger in a long voyage, both from the fact that the result of a change to the patient is unknown, and that there is a constant danger of suicide in melancholics. Some cases, he said, were best treated at home, but each case must be decided on its own merits. Some had said that forcible feeding need never be resorted to, but he considered it better to err on the side of over- rather than under-feeding. In his experience he seldom found it necessary to treat the insomnia of melancholics with hypnotics, and he mentioned that the experiments of Binz, of Bonn, rather tended to show that such drugs were injurious to the brain cells. With regard to other treatment, he laid great stress on close attention to all parts of the alimentary tract. In the discussion which followed, Dr. Fielding Blandford entered chiefly into the question of change of scene. He was sceptical about the advantage of a sea voyage, and thought that hypnotics were often very beneficial. Professor von Benedikt thought that often the use of narcotics made patients much worse and prolonged the disease. He also spoke in favour of the use of the galvanic and faradic currents applied to the spine in cases of melancholia, especially cataleptics. Dr. Norman Kerr thought a sea voyage with suitable companionship often beneficial. For sleeplessness he often had recourse to the hot and cold wet pack, and thought the best drug perhaps was phenacetin. The following gentlemen also spoke, and will be more fully reported later: Dr. Clouston,

Dr. Nicolson, Dr. Weatherly, Dr. Batty Tuke, and Dr. Eliza Dunbar. Dr. Rayner briefly replied. Dr. H. Head next read a paper on Mental Symptoms in relation to Bodily Disease in the Sane, in which he pointed out the results from a large number of observations on cases of visceral disease, in regard to associated mental change. With visceral disease is associated scalp tenderness, and according to the area of scalp tenderness the mental change varies more or less. Dr. E. S. Reynolds then read a paper on Mental Symptoms of Bodily Disease, which consisted of the enumeration of the different mental conditions associated with various diseases. His facts seemed to show that the mental change varied with the morbid condition, according as the disease was one of the lung or other viscera, or as it depended on the presence of an organic or inorganic poison. Mr. A. Maude also read a paper on Mental Symptoms in relation to Exophthalmic Goitre. These three papers were then discussed briefly by the following gentlemen: Dr. Urquhart, Dr. Harry Campbell, Dr. Mickle, Dr. Clouston, and Dr. Rayner.

SECTION OF PHYSIOLOGY.

THE Section of Physiology was opened by Dr. Ferrier with an Introductory Address given in the Physiological Laboratory of King's College. The Section was well attended, for in addition to many English physiologists several visitors from abroad were present, notably Professor Hamburger, Professor Stokvis, Professor Heymans, Dr. Mellus, and others. Taking as the subject of his address the relationship in which physiological and clinical work stand to one another in a general advance of either subject, Dr. Ferrier pointed out, by taking specific examples, how largely recent progress had been effected by a thorough and accurate combination of results attained by the two methods. Thus he mentioned how experimenting on animals, and from a physiological standpoint, Professor Sherrington had succeeded in mapping out a whole series of skin areas in relation to segmental regions of the spinal cord. Further, from the clinical side Dr. Head had attained great success by a thorough study of herpetic areas and areas of referred pain in showing the relationship of thoracic and abdominal viscera to spinal segments. Dr. Ferrier pointed out how great were the difficulties encountered by the clinical worker, as the cases he had to unravel were so complex and at first sight contradictory; yet in so many instances, so soon as physiological work could be brought to bear upon them, order soon appeared among the mass of facts which had been accumulated. Moreover, that working under the comparatively simple conditions produced by experiment, physiologists were in a far better position to criticise and throw light upon the obscurer facts of clinical work. To many physiological problems, however, an answer could only be finally obtained as a result of clinical study, and he therefore particularly emphasized the necessity of a worker in either branch being at the same time thoroughly trained in the other. Before the work of the Section was continued, Professor Michael Foster thought it would be fitting that the Section should express the pleasure they had experienced in listening to the address, and a resolution to this effect, seconded by Dr. Lauder Brunton, was carried with applause. Dr. W. H. R. Rivers then demonstrated two pieces of reaction-time apparatus for studying "choice-time" and "association-time." These times were measured by a chronoscope, so arranged as to be started by the closing of a current by the experimenter, and stopped by the opening of that current by the one experimented upon. In the first case the choice lay between the opening of one of the electrical keys. The second form of apparatus consisted in suddenly presenting a written word which was to call up some associated word, the time interval between the two being measured. Professor de Burgh Birch next showed some new forms of physiological apparatus which he had designed

for the new laboratory at the Yorkshire College, Leeds. These were illustrated by pieces of apparatus and by lantern slides showing the arrangement of the working tables and apparatus in the laboratory. Dr. Edridge-Green brought forward some experiments from which he argued that the yellow spot was not the most sensitive portion of the retina. Professor Bowditch, in some remarks made upon this communication, said that it seemed that most of these experiments appeared to be explained on the old view that the yellow spot was the most sensitive for form or outline, but the more lateral portions of the retina possessed a higher sensitiveness to luminosity. Dr. Marinesco next read a paper upon Tertiary Atrophy and Degeneration of the Central Nervous System. Foul, v. Masskoff, Darkewitch, and the author have brought forward facts which indicate that when the continuity of a nerve is broken, not only the central end undergoes a process of atrophic degeneration, but that this even oversteps the first neurose, and even in some cases the second, or a third. He considers the mechanism which determines the lesions of these neuroses to be of a reflex nature, and that, therefore, the Wallerian law should be altered, and for it "the trophic theory of functional afferent and efferent excitation," first put forward by the author in 1892, should be substituted. Dr. W. A. Turner read two papers, the first showing the Absence of Trophic Influences exerted by the Fifth Nerve upon the Cornea, and a second giving a short account of the Results of Lesions of Tuberculum Rolandi. Dr. William Hunter believed that he had, as a result of comparative experiments showing the action of toluylene-diamide upon intact animals and animals in which the spleen had been removed, been able to show that the spleen had a great influence as a blood-destroying organ. Dr. E. C. Mellus then showed some lantern slides illustrating Degenerations following Minute Lesions of the Cortex Cerebri, and the meeting then adjourned till the following morning.

SECTION OF ANATOMY AND HISTOLOGY.

THE Section of Anatomy and Histology was opened by an address by the President, Henry Morris, M.A., F.R.C.S. The President stated that this was the first time that a separate section had been made for anatomy at the meetings of the Association, and on this account he thought that it would have been better if the chair had been taken by a professor of anatomy. Formerly when papers on anatomy were given they were included in the Section of Physiology. Anatomy was not to be considered as a limited science which could advance no further. In its wider sense anatomy included histology, embryology, and morphology, and when thus understood it was comprehensive enough to occupy much of the daily life of many different sets of workers. The anatomy of the brain and nervous system had been almost rewritten during the past eight or ten years. The amount of knowledge which the student of medicine had to acquire in order to gain a diploma is at the present time enormous, and on this account the President agreed with Huxley's saying that "whoever adds one tittle that is unnecessary to medical education is guilty of a very grave offence." Professor W. Anderson, in opening a discussion in Art, its Relations to Anatomy, laid three considerations before the meeting: First, the debt that anatomy owes to art; secondly, the advantages that artists may derive from a scientific knowledge of anatomy; and thirdly, the extent to which artistic methods of observation may profit ourselves in the medical study of anatomy. A brief history of the rise of artistic illustration in its relation to anatomical teaching was given, and was illustrated by lantern pictures, which were taken from anatomical treatises from the time of Berengari de Carpi to the present day. The great artists of various periods were discussed and compared, and the anatomical details which were apparent in their works criticised. The comparative value of the different methods which have been adopted in various ages in the reproduc-

tion of anatomical pictures was considered. In the latter part of the paper the methods of teaching anatomy, and its importance in the education of the medical student, were fully dealt with. Professor Anderson advocated the use of dissected specimens by students of anatomy, and said that much valuable time was wasted by the student in dissecting parts of the human body, from which he was expected to acquire a good knowledge of the science of anatomy. In many cases these dissections were badly done, and as a result the student was induced to learn exact anatomical details by committing to memory statements in textbooks. A long discussion followed, in which Mr. Ellis, Dr. M. Griffith, Dr. Payne, Professors Keen, Thane, and Thomson, Mr. Cooke, Mr. Black, and the President took part, after which Mr. Anderson replied. Dr. J. F. Payne read a paper on an unpublished English Anatomical Treatise of the Fourteenth Century, and its Relation to the Anatomy of Thomas Vicary. The manuscript contained an incomplete treatise of anatomy, and a short treatise on the anatomy of the human body. The work was said to be by an English surgeon, whose name is not given in the work, which was dated 1392. Dr. Payne said that from the writing, the substance, and the language of the work that it clearly had been written during the latter part of the fourteenth century. Professor Anderson and Dr. Payne exhibited a collection of old Anatomical Treatises, among which were examples of Bidloo, Browne, Remmelin, Vesalius, Duval, Virat, Cowper, Coster, Mundini, Highmore, Duverney, Godfridi, Camper, Eustachius, Spigelius, and Cheselden.

SECTION OF PATHOLOGY AND BACTERIOLOGY.

THE Presidential Address was delivered by Dr. Samuel Wilks, F.R.S. In the course of his remarks he drew attention to the fact that every pathological process is accompanied by a corresponding reparative process, and lamented that as a teacher of pathological anatomy he had not paid sufficient regard to the distinction between these constructive and destructive processes. To study these for the sake of discovering the several influences exerted in the production of each is of great practical import; and a consideration of them also shows that pathology is governed by the same laws as those which exist in every other department of Nature, and therefore must take its place on an equivalent footing with the other sciences. Dr. P. Manson opened the proceedings proper by a demonstration of the Malaria Parasite accompanied by a paper dealing more especially with the life history of the parasite outside the human body. Having just pointed out the analogy between the filaria and the parasite he proceeded to show how it was probable that the intermediate host was the mosquito. This subject had been investigated at his suggestion by Surgeon-Major Ross, of Scund-rabad, and with striking results, which made it extremely probable that the mosquito, as suggested by the author, is the intermediate host in question. Dr. Thin opened the discussion on this very interesting paper by offering some objection to Dr. Manson's hypothesis, and after some remarks by the President and a question on the presence of the organism in *post-mortem* conditions, Dr. Manson replied. In the course of his reply, he remarked that while there were undoubtedly many objections to his theory, yet he hoped that with the more complete investigation of what was as yet an entirely new field, these could be removed. Dr. Risien Russell then read a paper on Some Congenital Defects of the Cerebellum, and was followed by Dr. Foxwell's account of an acute case of exophthalmic goitre which had recently come under his care. Dr. George Murray, in his communication on the Effects of Thyroidectomy in the lower animals, drew attention to the similarity of the effects observed in rabbits after this operation to the symptoms of myxædema in man. His paper was illustrated by lantern photographs showing

the apathetic condition of the animals operated upon, and the swelling of the neck and skin lesions, all of which he remarked were analogous to the similar effects observed in man. After the paper Dr. Lorrain Smith and Auld put questions relating to the details of his experiments, which were replied to by the author. Dr. Robertson's paper was at this point handed in and taken as read. It dealt with the Pathology of the Subdural Membrane, and will be more fully reported later. Mr. Targett next proceeded to give an account of some cases of syringomyelia recently under his care, and pointed out the similarity of the joint lesions met with in this disease to those so characteristic of locomotor ataxy. He also drew attention to the other lesions met with, namely, trophic skin changes, muscular atrophy, and the curious nervous disorders, among which the condition of insensibility to pain and sensations of heat, with the persistence of commoner sensations, are the most remarkable. After a short paper by Dr. Robertson on Arachnoid Haemorrhage, the Section proceeded to the consideration of the long list of papers dealing with Cancer. Dr. Braithwaite opened the discussion by giving at length an account of his discovery of a mould as the exciting cause of the disease. His histological observations were stated by Mr. Soutter, Mr. D'Arcy Power, Dr. Russell Webb, and Dr. Bousfield to have been entirely based on misconception. Dr. Hewlett read his paper on Ehrlich's Dye Reaction. He finds that the micro-chemical reactions of the so-called cancer parasites are wholly unlike those of the cocci with which they are usually associated. Mr. Blake then read his paper on the Occurrence of Cancer in Chalk Valleys, and was followed by Dr. Herbert Snow on the Infectious Marrow Infection of Mammary Carcinoma. Dr. Snow drew attention to the danger of such infection being passed over undiagnosed, as it might very easily do, the symptoms being ill defined. Dr. Braithwaite here replied to the criticisms which had been brought against his paper, and concluded by explaining Dr. Snow's cases as bearing out the hypothesis of cancer being a waterborne disease. Dr. Kelynack's paper on the Occurrence of Cancerous Change in Simple Ulcer of the Stomach was here handed in and taken as read, and the proceedings terminated with the exhibition of a Larynx from a Case of Typhoid Fever and a short summary of Dr. Bousfield's work on the Cancer Process, illustrated by some very beautiful microphotographs of his specimens, taken by the author, and projected on the screen.

SECTION OF OPHTHALMOLOGY.

IN welcoming the members of this Section, the President remarked on the work that had been done by the founders of ophthalmology in the past, and the gradual formation of a scientific branch of medicine, whose methods of diagnosis and treatment were fortunate in being founded on pure science. Owing to its intimate relations with the other branches of medicine and surgery there was no danger of its separating from the parent stem and becoming barren; at the same time he advocated a sounder education in the sciences on which ophthalmology was established, such as mathematics and physics, being required of all candidates for ophthalmic posts in hospitals. Dr. Benson (Dublin) read a paper on Acromegaly with Ocular Complications, which presented some peculiarities; it was discussed by Drs. Meyer and Panas (Paris), Dr. Little, Mr. Swanzy, Professor Fuchs (Vienna), Dr. Hill Griffith, and Mr. Snell. The discussion of the day was opened by Professor Fuchs (Vienna) on a recurrent form of ophthalmia, for which he proposed the name "episcleritis periodica fugax," which occurred chiefly in males, ran a course extending over many years, rarely became serious, and which was scarcely at all benefited by treatment. The discussion was continued by Messrs. Berry, Emrys-Jones, John Griffith, Hern, and Walker. A paper on the Injection of Chlorine Water into the Vitreous followed, in which Dr. Berry advocated this form of treatment in cases of threatening suppuration of the

globe; remarks were made by Dr. Argyll-Robertson and Mr. Nettleship. Dr. Ball (Paris) next read a paper on Optometry by the Subjective method, and Dr. MacGillivray a paper on Hereditary Congenital Nystagmus associated with Head Movements, which was discussed by Dr. Lloyd Owen, Messrs. Smith, and G. Walker. A new form of tonometer was described and demonstrated by its inventor, Dr. Koster (Utrecht). Mr. Lee then read a paper on a case of Pemphigus of the Conjunctiva; Professor Gayet (Lyons) showed a series of photographs of cases of Strabismus, before, during, and after treatment, and advocated the use of such records as valuable in determining the effect brought about by the treatment. The business of the day was terminated by a paper on Choroidal Sarcoma in Children by Mr. John Griffith.

SECTION OF DISEASES OF CHILDREN.

The Section for the Diseases of Children met at King's College. The subjects for discussion included Congenital Syphilitic Manifestations in Bones and Joints, introduced by the President of the Section, and the Treatment of Hernia in Children. There was a very good attendance of members, and, the subjects being mainly of a surgical nature, many well-known surgeons contributed to the discussion. The President, in opening the proceedings, gave a short review of the work done by the Section in past years, which, though including a very wide range of subjects, had still left undiscussed a large number of most important questions of disease as occurring in children. He was in hopes that a Section of such importance as this had established a permanent place in the proceedings of the Association. The President then opened the discussion on Congenital Syphilis of Bones and Joints with a highly interesting paper in which, after alluding to the researches already made in this country, he proceeded to discuss the pathology and clinical features of the atrophic and osteophytic varieties of the disease. The relation of rickets to congenital syphilis was also very fully discussed, especially with reference to the causation of cranial bosses and cranio-tabes, and to the occurrence of chronic effusion into joints. Other speakers were Mr. Frederic Eve, who continued the discussion of these last-mentioned points; Mr. D'Arcy Power, who quoted instances showing the difficulty of diagnosis between syphilitic and tuberculous joint disease; Mr. H. B. Robinson, who discussed the order in which changes in the bones begin to appear; Dr. Thomas Barlow, who laid stress on the modification effected in cases of rickets by the existence of congenital syphilis; and Mr. H. Stansfield Collier, who described three cases of syphilitic effusion into joints unaccompanied by any previous bone disease. Mr. Rushton Parker (Liverpool) read an interesting paper on the Treatment of Hernia in Children. During the last four years he had operated on 40 cases, all males, and all for inguinal hernia, in some cases double; out of these he had had two fatalities. He preferred not to operate if the patient was under 6 months except in urgent cases. He considered the chances of recurrence in children very small. He advocated Macewen's operation as the most secure if not the easiest method. He laid great stress on prolonged rest in the recumbent position after operation—in children over 6 years, six weeks. Mr. C. B. Lockwood emphasized the difficulty of completely separating the sac from the spermatic cord in young children. Mr. John Langton advocated treatment by truss only in a large majority of cases. Professor William Macewen spoke of the impossibility of dealing effectively with hernia in hospital practice by means of a truss, an opinion which was endorsed by every speaker present. He considered the delicate tissues of children were quite reliable for this operation, and in about thirty cases operated on by him had met with perfect success. Dr. Ward Cousins considered the operation in children over 12 months old eminently satisfactory, and gave an interesting account of his own method of procedure. Mr. J. Mac-

ready, Mr. F. A. Southam (Manchester), Mr. H. P. Symonds, Mr. Reginald Lucy (Plymouth), Mr. Damer Harrison (Liverpool), and Mr. H. Waterhouse all contributed to a highly interesting discussion, which included methods of operation, kind of sutures, dressings, etc., advocated by each speaker. The President referred to the frequent occurrence of strangulated hernia in young children. A case of congenital syphilis of the tongue was shown at the conclusion of the meeting by Mr. Jackson Clarke. The speeches were throughout followed with the greatest interest by those who attended the Section, and it was agreed that the meeting was one of the best that has so far been held.

SECTION OF OTOTOLOGY.

SIR WILLIAM DALBY, in opening the Section, referred to progress made in otology since the last meeting, and spoke hopefully of the future for aural surgery. He showed a case of Objective Tremors in a young lady, where a grating sound synchronous with the pulse could be very distinctly heard by direct auscultation. Mr. Cresswell Baber mentioned a similar case where he thought the sound was probably muscular. A discussion on the Treatment of the Various Forms of Nerve Deafness, was opened by Dr. Dundas Grant. He rapidly enumerated the various forms of disease of the labyrinth, the auditory nerve, and the auditory centres, and insisted on greater precision in their diagnosis. The means of treatment at our disposal were reviewed, and their indications explained. He concluded with regard to pilocarpin, that it was of benefit in recent exudations into the labyrinth, but comparatively useless in those of old standing. He had only once seen any improvement in hereditary syphilis from its administration. Galvanism was found beneficial in functional deafness, and in uncomplicated nerve deafness from habitual exposure to noise. Dr. Lewis Jones, in reference to the Treatment of Nerve Deafness by Electricity mentioned by Dr. Grant, pointed out that it is difficult to say at present how far we can vary the nutrition in sensory end organs by electricity; but, on the other hand, the nerve trunks appeared to respond well to this treatment, some cases of neuritis being distinctly improved. With a more perfect knowledge of nerve deafness we shall probably be able to sort out favourable and unfavourable cases for electrical treatment. Dr. Macnaughton Jones, in a paper on Some Etiological Considerations on the Treatment of Nerve Deafness, pointed out the frequency of middle-ear disease complicating disease of the internal ear, and raised the question how far we are justified in classifying a case as nerve deafness. He had not found any good result from pilocarpin or electricity. Dr. Thomas Barr pointed out the importance of the question of middle-ear disease in nerve deafness; he agreed with Dr. Macnaughton Jones in his experience of pilocarpin. Dr. Edward Law raised the question as to the advantage of Mercury in Cases of Old-Standing Syphilitic Deafness; he had found little improvement as far as the deafness was concerned from either it or pilocarpin. Dr. Milligan had found little result from any form of treatment when the auditory nerve was really involved. Mr. E. H. Bennett mentioned three cases of improvement under pilocarpin. Dr. Warren (Birmingham) stated that he had used pilocarpin with little result in some cases. Dr. Macnaughton Jones agreed with Dr. Grant that pilocarpin might be of use in some cases of recent labyrinthine effusion. Mr. G. W. Field, continuing the discussion, believed that if suitable cases are chosen good results will be obtained from pilocarpin. Sir William Dalby mentioned, with regard to the treatment by quinine, that care should be exercised in its administration, in some cases the deafness being increased. Dr. Milligan (Manchester) read a paper on Tuberculous Disease of the Middle Ear, pointing out that most probably primary tuberculosis of the middle ear was more frequent than had hitherto been supposed. Cases of painless perforation of the membrane with discharge, and especially

if complicated with facial paralysis, were usually tuberculous. He made inoculation experiments on guinea-pigs with the pus from a series of mastoid operations, and found evidence of tubercle in eight out of ten (80 per cent.) The paper was illustrated with drawings, dissections, and microscopical preparations. Dr. T. Barr (Glasgow) followed with a paper on the Treatment of Intractable Suppuration of the Middle Ear by Operation through the Mastoid. He strongly advocated the use of the globular dental burr in the operation, followed by the gouge, the clean surface left by the burr being of great advantage in estimating the depth and direction. He had generally found that the time from the operation to the total cessation of discharge was from two to eighteen months. Dr. Bronner (Bradford), in a paper on Five Cases of Attic Disease Treated by Modified Stacke's Operation, advocated the thorough exploration of the attic and mastoid cells in cases not yielding to ordinary treatment. Dr. Urban Pritchard recommended the sharp spoon in cases where the bone is soft, as in tuberculous cases in young children; the burr, however, might be better in cases of adults where the bone is sclerosed.

SECTION OF PHARMACOLOGY AND THERAPEUTICS.

The meeting of this Section, under the presidency of Sir William Roberts, was from the very commencement extremely well attended. This was no doubt due to the attraction offered in the shape of a discussion on Sero-Therapeutics, embracing the application of serum treatment, not only to the acute infective disorders, but also to the cure of bites from venomous serpents. In his introductory remarks the President drew attention to a hitherto much neglected alkaloid of opium, generally known as "narcotine," but more properly termed "anarcotine," from the complete absence of narcotic properties. A large amount of evidence was available which seemed to show that this alkaloid has very valuable antiperiodic powers, which should further investigation corroborate, will render it a valuable remedy in certain cases of malaria in which quinine entirely fails. The discussion on Sero-therapeutics was opened by Dr. Klein in a paper on the Nature of Antitoxin. He drew attention particularly to the differences in action between a protective serum obtained from animals immunised by injections of filtered diphtheria toxin, and by those treated with living cultures of the diphtheria bacillus. He had found that while the first had an extremely high neutralising power on the chemical poison separated from the bacilli, it had not nearly so marked an immunising power. On the other hand, an antitoxin prepared with the aid of living cultures, while it was less active than the other in neutralising toxins, was far more efficacious as an immunising agent. He also gave brief hints on the advantage of using a dried serum in place of the usual liquid form, and stated that the use of the former was far less likely to be followed by the appearance of rashes and other complications. Dr. Washbourne next spoke as to the clinical uses of antitoxins. The evidence available in the case of tetanus antitoxin was at present hardly sufficient to dogmatise from, as tetanus is very rare in this country. Such evidence as we do possess is, however, highly encouraging. In the case of antidiphtheritic serum there is now so much evidence in its favour as to allow little room for doubt as to the benefits derivable from its application. Dealing with the complications attending this mode of treatment, he was of opinion that there were not sufficient grounds for supposing that serum injections were directly provocative of albuminuria or of anuria, as had been stated by some. These were both common complications of severe cases before serum therapeutics were even thought of. Eruptions and joint pains were, however, undoubted sequelae, but they were not of great clinical significance. Of the use of serum as a prophylactic hardly enough experience had as yet been acquired to allow one to form an opinion as to its value. Dr. Hewlett next read a

paper on Tetanus Antitoxin, describing the difficulties surrounding its preparation. He had been unable, even with the greatest care, to produce a sufficient degree of immunity in a horse for therapeutic purposes in less than five months, although French observers had done so in a shorter time. He prophesied a sure future for this antitoxin in countries where tetanus was largely prevalent. Dr. Tizard gave his experience of serum treatment in cases of diphtheria at the Evelina Hospital, where he had obtained very satisfactory results from it. Mr. Bokenham described a method by which he had succeeded in getting the diphtheria serum in a dry state—a great advantage, in that it offered a means of reducing the dose necessary in any given case. He had been able to show that a great deal, if not most, of the efficacy of such a serum resided in a constituent other than the albuminous portion. Dr. Gayton spoke of his experience of serum treatment of diphtheria at the North-Western Fever Hospital. It was hardly as satisfactory as that of most other observers. Dr. Caiger, of the South-Eastern Fever Hospital, testified to the efficacy of the treatment, but he had found it desirable to use far larger doses than those usually recommended. In spite of this he had met with but few complications. Professor Fraser drew attention to the great care needed in testing the activity of serum before its issue for use. The consideration of papers other than those bearing on sero-therapeutics had, for want of time, to be very briefly taken. The chief of these was one by Professor Fraser on Antivenene, but more than a few words are needed to do justice to this most important subject.

SECTION OF LARYNGOLOGY.

The first paper in this Section was on the Etiology of Mucous Polypi of the Nose, by Professor Guye, of Amsterdam. He discussed Woakes's theory of necrosing ethmoiditis, and that of Grünwald of empyema of the accessory cavities of the nose as the cause of polypi; and quoted the criticisms of Zuckerkandl. His own experience was in accordance with Zuckerkandl's criticism, and he brought forward clinical evidence of cases of polypi due to ozena, rhinoliths, etc., but emphasised the fact that in the large majority of cases the etiology remains undetected. Dr. Luc (Paris) maintained that the causation of polypi by empyema of the antrum was far from being a frequent one. He criticised the work of Woakes inasmuch as clinical description of cases is not introduced. He considered that myxomatous degeneration represented the mode of reaction of the middle meatus mucous membrane to noxious influences, and that polypi are perhaps confined to this region by reason of the presence of folds of the mucous membrane. The exciting cause of the polypi may be catarrh or rarely bone lesion, and in most examples their origin appears to be spontaneous. Professor Zuckerkandl considered that the inflammatory origin of polypi is evidenced by the presence of round-celled infiltration and by the changes in the underlying bone. No line of demarcation can be made out between these formations and surrounding hypertrophied mucous membrane. In contradistinction to actual new growths, mucous nasal polypi are never congenital. The dissimilarity between the middle and inferior turbinates as seats of polypi is due to physical and dynamic causes. These polypi are essentially inflammatory in nature. Osteophytic changes in the bone are testimony in the same direction. Dr. McBride (Edinburgh) divided polypi into those of the upper and middle and lower passages of the nose, the lower being that variety of mucosal hypertrophy which was known as papilloma of the turbinate, the upper being similar to them but developing into polypi, which he described as adenomatous fibromata. He further said that inflammation was not enough to account for cases of polypi, nor did empyemata suffice, but the force of gravity must be considered; another explanation would probably be found in some irregularity in the structure of the nasal mucosa in those who suffer

from nasal polyp. He drew particular attention to the redness of the polyp springing from the ostium maxillae. Dr. Hodgkinson said empyema was not necessary for polypus formation. A pendulous condition, though not necessary, might be so at the commencement of the disease. He had not observed necrosis. Dr. Scanes Spicer quite agreed with Dr. Luc. He considered necrosing ethmoiditis a bad term. Necrosis was extremely rare in connection with ethmoiditis. Dr. William Hill said myxomata of the ear and nose were much alike, both in structure and also in similarity of environment. He considered that the easiest form of nasal polyp to cure was that associated with purulent affection of the nose. He thought Dr. Woakes was not altogether wrong in his opinion. Dr. Bosworth (New York) was surprised that the late speakers took Dr. Woakes's necrosing ethmoiditis seriously. The mucous membrane was less thick in the accessory cavities than in the nasal cavities, the ethmoid and small cavities especially. He did not believe in dry necrosis. Dr. Moriz Schmit (Frankfort) maintained that polypi were due to inflammatory swelling of mucous membrane and muco-periosteum. Dr. J. N. Mackenzie (Baltimore) said he believed in the inflammatory origin of polyp. He preferred the term endorhinitis to rhinitis. He thought Dr. Woakes was not correct; caries might occur, but not necrosis. Dr. Daly said he believed in the suction influence in inflammatory conditions. He had never seen a case of antral disease due or subsequent to nasal polyp. Dr. Newman (Glasgow) said edema of the mucosa and hypertrophy acted as causes in formation of polyp. They were never myxomatous and contained water and serum albumen. There was a predisposition in the mucosa in certain people, due to fibrosis of the submucous tissue. Mr. Lake said he had never seen a myoma, and none that could be called oedematous fibromata. In children with hypertrophic rhinitis the absence of polyp was due to absence of suction due to obstruction of the nares by adenoids. Dr. Watson Williams quoted evidence in his possession of bone changes in this disease, shown by spicules of bone. Dr. de Roaldes said nasal polyp were less common in blacks, as also was empyema of accessory sinuses. Catarrh was commoner in whites, who strained more in blowing the nose. Drs. Guye, Luc, and McBride briefly replied. Dr. Helen Russell read a paper on the Representation of Abduction of the Vocal Cords in the Cerebral Cortex. He referred to the failure of previous experimenters to obtain this by severing the adductor fibres of the recurrent on one side, leaving the abductor fibres intact. Stimulation of certain parts of the cortex elicited abduction of the vocal cord on that side. Previous failures were due to preponderance of adduction. Dr. Felix Semon congratulated the author on his ingenuity and success, and asked, amongst other things, whether Dr. Russell had ever found any evidence of unilaterality in the cortex. Dr. Bryson Delavan (New York) mentioned a case of his bearing on the point; and Dr. Watson Williams mentioned a case of Jacksonian epilepsy, with motor aphasia, with good movement of cords. Dr. Russell replied to the President's question in the negative. Dr. A. Hodgkinson (Manchester) presented a communication on Vibrations of the Vocal Cords. After a reference to sound pictures, he said indigo blown into the larynx acted similarly. Coughing should be avoided; a sound should be made and the effect on the indigo on the cords observed. In deep notes there could be seen a dark line parallel to the edge of the cords, becoming convex towards the ventricle from the anterior commissure to the posterior vocal process. The darker the note the further back the line went, showing that the vocal processes vibrate in low notes. The whole vocal cords vibrate in low notes, the movement being greatest at the central free edge. In falsetto notes the line was parallel with the free edge. Dr. Hingworth read a paper on Some Points in the Anatomy and Physiology of the Larynx. He said the larynx was not a stringed instrument; it was

like a cornet; and that the falsetto voice was produced in the larynx.

SECTION OF DERMATOLOGY.

Dr. RADCLIFFE CROCKER, President of the Section, in his opening address, laid especial stress on the great advances that had been made in dermatology during the last twenty years. Dermatology was first represented at the Dublin meeting some sixteen years ago. Since then the Section has firmly established itself as one of the most important. After referring to the great clinical opportunities existing in London for the study of diseases of the skin, he expressed regret that owing to the decentralisation system obtaining in the metropolis visitors from the Continent were not as much impressed as they might be with the enormous amount of material available. The first paper taken was that of Dr. John Liddell (Harrogate), giving the details of a case of Pityriasis Rubra Pilaris in a girl. After describing the clinical features of the case Dr. Liddell gave an exhaustive account of the minute anatomy, and subsequently demonstrated the histological appearances with microscopic sections. Dr. McCall Anderson (Glasgow), then opened the discussion on the Pathology and Treatment of Pruritus, addressing himself to the condition of pruritus when no other cutaneous lesion existed. He also examined those forms of pruritus present in jaundice and diabetes, and the itching due to cold. With regard to the treatment, the cause must be removed where possible. He had found the coal-tar derivatives, such as antipyrin and phenacetin, very useful in combination with electricity; but the latter agent used alone also proved advantageous. Dr. H. A. G. Brooke (Manchester) followed with a paper on the same subject. He proposed, for working purposes, a classification, consisting of two chief groups, based on the origin of the condition, whether external or internal. He reviewed at some length the various causes which led to itching, insisting specially on the nervous conditions. In the subsequent discussion, Drs. Myrtle (Harrogate), Waldo (Clifton), Stopford Taylor and Barandt (Liverpool), and Mrs. Garrett Anderson gave their experience of the treatment of this troublesome symptom. In the discussion which followed Dr. P. H. Pye-Smith's interesting paper on Affections of the Skin occurring in the course of Bright's Disease, the President, Drs. Savill, Bradbury (Cambridge), Waldo, and Grange took part. The curious life-history of the Guinea-Worm was fully described by Dr. Patrick Manson. Various phases in the evolution of the embryo were illustrated by microphotographs. Dr. Harrison made some remarks on this paper. Dr. Galloway then gave a lantern demonstration of certain nervous lesions of the skin. The meeting concluded with the clinical notes on Two Cases of unusual Verruca Necrogenica which had come under the observation of Dr. A. J. Harrison (Clifton), who showed illustrative photographs. Among the foreign visitors present were Drs. L. A. Nókám (Buda-Pesth), A. Jordan (Washington, D.C., U.S.A.), and Adalbert Frickenhaus (Stuttgart).

SECTION OF ETHICS

THE meeting of this Section was well attended. All the officers were present, and Dr. Cleveland delivered his opening address to a very fair audience. Dr. T. Garrett Harder then began the discussion on Intraprofessional etiquette. He divided his subject into three heads: (1) Between medical men themselves; (2) In relation to professional appointments; (3) between consultants and general practitioners. He briefly commented on these three subdivisions, pointing out the numerous difficulties that were apt to arise in each, and gave examples of what he considered very improper conduct of medical practitioners in their dealings with professional brethren. Drs. Lea, Pearce, Hemming, Harris, Woods, Greenwood, McNeil, Bridgley James, Young, Lacey, Dickinson, Rice, and Parsons took part in the discussion.

Dr. Lea (Cork) wished to propose a resolution: "That in the opinion of this Section any practitioner who wilfully violates the generally received rules of professional ethics be not met in any professional intercourse whatever, save in a case of very urgent danger to an individual patient." The Chairman ruled that this resolution should be deferred till Friday. Dr. Potter then introduced the subject of Advertising, in which he very ably pointed out the very numerous ways in which medical men brought discredit on their profession in this way, and especially insisted that when the advertising in the lower branches of the profession was condemned, practices differing very little in principle perpetrated by practitioners of a higher standing ought not to be condoned. Drs. John Brown, Brindley James, Greenwood, Norris, Nelson Hardy, Eyre, and Pearce took part in the discussion which followed. Dr. Potter proposed a resolution: "That advertising in every shape is highly derogatory to the profession, and that the Council be requested to use every effort to suppress it." This resolution was likewise deferred till Friday. Dr. Bridgwater brought before the Section a resolution just passed by the Council: "That in the opinion of this Council the granting of testimonials, which are used for the purpose of advertising proprietary drugs and similar articles is inconsistent with the dignity of the profession and opposed to its best interests." This was highly approved of by the Section. Mr. George Brown introduced a discussion on Unqualified Assistants. He said that the practice was to be condemned from three points of view: (1) Personal, (2) professional, (3) public. As to the first, great danger was incurred by the practitioner, who made use of them; as to the second, it was wrong to employ unqualified men when there were many qualified men ready to do the work, the non-employment of whom frequently compelled them to open cheap dispensaries and to become medical officers of medical aid societies; as to the third point, it was a direct fraud on the public and highly immoral from that point of view. In the discussion which followed Mr. Brindley James and Drs. Lattey, John Brown (Bacup), Greenwood, and Bridgwater took part. Mr. George Brown, in answering, said he should move a resolution on the subject on Friday.

Thursday, August 1st.
SECTION OF MEDICINE.

The practical nature of the subject attracted a large audience to the Section of Medicine on Thursday. The President opened the meeting with a few remarks upon the importance of Acute Pneumonia, and called upon Dr. Douglas Powell to open the discussion on the subject. Dr. Douglas Powell, who was very warmly received, expressed his regret at being unable to record any practical abatement of the mortality from pneumonia, notwithstanding improved public health with regard to other diseases, and especially those of the zymotic class. He then briefly described the relationship of pneumonia to severity of climate as dependent upon latitude, pointing out that it was directly influenced by seasonal lowness and by changeableness of temperature. In discussing the etiology of the disease, he insisted upon the importance of remembering that other factors are necessary for the development of pneumonia in addition to the micro-organisms. He rapidly reviewed the evidence in favour of the microbic origin and against it, laying special stress upon the fact that Fraenkel's pneumococcus had been found in healthy saliva, in the exudation in meningitis, in ulcerative endocarditis, and in otitis media which had little pathological resemblance to pneumonia, and with which pneumonia was not commonly associated. After describing the varieties of the disease, and reviewing the different modes of treatment in vogue, he came to the conclusion that the ordinary saline drug treatment was based upon sound principles in uncomplicated cases, whilst when these special indications for the use of strychnine, calomel, digitalis, and morphine were most valuable remedies. Finally,

as to the antitoxin treatment of pneumonia, Dr. Powell stated that he was still of an open mind; that he had not had an opportunity of trying it, but that he thought that it would probably be along these lines that progress would be made in the future. Dr. Washbourn continued the discussion, confining his remarks to the microbic theory of the disease and to its treatment by means of antitoxin. He insisted upon the great importance of revising our nomenclature of the subject, and, speaking of pneumococcal meningitis, pleurisy, etc., in all those cases in which Fraenkel's coccus could be demonstrated. Dr. Auld (Glasgow) followed on somewhat the same lines. Dr. Dreschfeld then referred to the importance of the clinical varieties of the disease. Dr. Pollock considered that bacteriological diagnosis was overrated in importance. Dr. Foxwell was glad that Dr. Powell recognised pneumonia as a specific infectious disease; Dr. Tyson considered that the bacteriological examination into the subject had explained the great differences clinically met with in various cases; Dr. Balfour (Edinburgh) spoke upon treatment generally, and Professor Badmiller (Freiburg) insisted upon the importance of the treatment of pneumonia by cold bathing; Professor Clifford Allbutt, and Drs. Gibson, Coghill, Hawkins, Lees, Pope, and Squire continued the discussion, and Dr. Douglas Powell briefly replied. The papers advertised were then read by their authors and briefly discussed, the proceedings being somewhat hurried owing to the undue length of the discussion upon pneumonia.

SECTION OF SURGERY.

The second day's proceedings in the Section of Surgery fully maintained the high standard which the first had reached. The meeting opened with a paper by Mr. Howard Marsh, on some rare forms of Bony Ankylosis. He began by referring to the teaching, till lately almost universal, that bony ankylosis never occurred but as the result of suppuration, and that joint suppuration invariably led to bony ankylosis if recovery took place. Neither of these doctrines is true. Instances of recovery from suppuration without the supervision of bony ankylosis may be seen in pyemia, in acute suppurative arthritis following wounds, in the acute arthritis of infants, and in many cases of chronic tuberculous diseases of joints. It was, however, with the occurrence of bony ankylosis without antecedent suppuration that the paper mainly dealt. Mr. Marsh enumerated eight classes of cases in which this takes place. Some of these are comparatively common; such are osteo-arthritis, tuberculous joint-disease, and gout. Among the rarer forms must be mentioned an exceptional case under the care of Mr. Bowlby, in which bony ankylosis of one of the interphalangeal joints followed an injury to the median nerve in the forearm, and some instances of ossification of the intervertebral discs throughout the whole spinal column. The changes in the latter form of ankylosis are essentially different from those in osteo-arthritis, where the ossification occurs in the ligaments, particularly in the anterior common and the ligamenta subglava. Mr. Marsh expressed his conviction that bony ankylosis was always either reparative or degenerative, that no known means would avert it, but that the deformities resulting from it might be relieved by osteotomy or excision. An animated discussion followed this extremely suggestive paper. Mr. Targatt doubted the occurrence of bony ankylosis in Charcot's disease, to which Mr. Marsh had referred, without the previous occurrence of suppuration, as from perforating ulcer. Mr. Bowlby stated that the joints in most cases of nerve injury exhibited changes like those in acute rheumatism, which usually subsided, but sometimes became permanent. He expressed his opinion that many joint lesions were due to affections of the central and peripheral nervous system, and hoped that the nervous origin of rheumatoid arthritis would be speedily established. Mr. Bland Sutton gave examples of ankylosis from pressure—for example, between the cervical vertebrae of persons habitually

carrying weights on the head—and compared them with similar conditions in the lower animals, particularly oxen and horses. Mr. Buckston Browne then read a paper in which he described the occasional impaction of vesical calculi between the lateral lobes of an enlarged prostate and the wall of the bladder. In this position they can neither be reached by the sound nor crushed by the lithotrite, and require to be removed through a suprapubic incision. Mr. Mayo Robson described a unique case in which the stone was embedded in front of the prostate. Dr. W. Newman then described a case of symmetrical necrosis of the lower third of both femoral shafts; and Sir W. Mac Cormac having said a few words with reference to the proposed national memorial to Professor Huxley, the meeting proceeded to discuss the Surgery of Tumours of the Thyroid Gland. Mr. Butlin stated his belief that very few malignant tumours of the gland were suited to surgical interference, and that cysts and adenomata should usually be treated by enucleation or extirpation except when it was necessary to avoid an unsightly scar, when injection should be practised. The general opinion of the subsequent speakers was adverse to injection. Professor Keen (Philadelphia) gave an interesting account of Professor Kocher's method of operating, the main features of which were non-use of anaesthetics except in special cases, a transverse incision and elaborate precautions to preclude hæmorrhage. Other surgeons, particularly Mr. Charters Symonds and Mr. James Berry, gave operative details based on their personal experience, and Mr. Butlin concluded by summing up the results and methods as comparing most favourably with those of Continental surgeons.

SECTION OF OBSTETRICS AND GYNÆCOLOGY.

PROFESSOR MARTIN (Berlin) read a paper on Anterior Colpotomy, based upon his experience of 100 cases. He especially pleaded for conservancy in the treatment of the various diseases of the adnexa, and considered that the possibility of preserving the appendages in hydro- and hæmatosalpinx, and such conditions, was greatly increased by the performance of this simple and safe operation. Dr. Taylor (Birmingham) followed with a paper upon the same subject, and Dr. Donald (Manchester) read a paper on a case of tubal gestation treated by vaginal colpotomy. A very interesting discussion followed, in which Dr. Cushine (Berlin), Dr. Smyly (Dublin), Dr. Walter (Manchester), Dr. Amand Routh and Dr. Smith (Dublin) took part. Dr. Playfair then read a paper on the Education and Training of Girls at and about the Age of Puberty. This excited a very interesting discussion, especially amongst the lady members of the Section, in which Mrs. Scharlieb, M.D. (London), Miss Gray, Miss Winifred Dickson, Dr. Miller, and Dr. Stallwright took part. Dr. Swayne followed with a paper on the Treatment of Eclampsia occurring during Pregnancy, and Presenting no Signs of Labour. In the discussion following, Surgeon-General Harvey (Calcutta), Dr. Rowley (Barnsley), Professor Cordes (Geneva), Dr. Cowley (Melrose), Dr. Games (Preston), Mrs. Scharlieb, Dr. Smyly, Dr. Griffiths, and Dr. Barbour took part. Mr. Stanmore Bishop (Manchester) showed a new form of Ovariectomy Trochar with Expanding Side Wings, intended to prevent the slipping of the instrument after penetration of the cyst wall. Dr. Muret (Lausanne) showed a Placenta from one half of a Uterus Bicornis, and a specimen of Tubal Pregnancy with a very beautiful foetus (cast). Dr. Birmingham showed a Waterproof Apron with an Air Cushion round, to be used at confinements, and for giving vaginal douches.

SECTION OF PUBLIC MEDICINE.

THE work of the second day began with the reading of a paper on Smoke Abatement, by Brigade-Surgeon-Lieutenant-Colonel R. Pringle, M.D. This was followed by a paper by Dr. Boobyer (Nottingham) on Hospital Isolation and the Prevention of Patients. He thought more stress should be laid upon the treatment of enteric disease more on the lines

of epidemics of infectious diseases. Dr. J. Spottiswoode Cameron (Leeds) deprecated any interference on the part of local authorities, and agreed with Dr. Boobyer regarding the necessity of isolating typhoid fever. He regarded the comparative immunity of Huddersfield from typhoid fever as due to the free use of the infectious diseases hospital. Dr. Barwise agreed in the main with the foregoing speakers, and declared himself emphatically on the side of large central hospitals as being cheaper both to administer and to build. Dr. Pringle, Dr. Richards, Dr. Fraser, and Dr. Berthon joined in the discussion. Dr. Caverhill (Edinburgh) spoke of the use of the tortoise tent. He was against such a structure for the acute stages of infectious disease. These hospitals should only be supplementary to more stable buildings. Dr. Fosbrooke (Worcester) traversed the statement that patients could not be removed with safety a larger distance than five miles. His experience was endorsed by Dr. Ogilvie Grant (Inverness), who urged the Section to help in bringing about the amendment of the Public Health Act, so as to enable authorities to obtain suitable sites for infectious hospitals by compulsion. Dr. Bond (Gloucester) emphasized the difficulty of obtaining initial force for carrying on sanitary improvements. Little progress would be made unless the bodies could be induced to take a more serious view of their responsibilities. In his reply Dr. Boobyer mentioned cases where great difficulties would be experienced in removing great numbers of patients great distances. Under such circumstances extreme centralisation would be found to be a mistaken policy. It was extremely fatal to remove typhoid cases after the second week. Dr. Klein then introduced the subject of the Diagnostic Value of the Diphtheria Bacillus. He described the difficulties which existed in working out the diagnosis of diphtheria even by the bacillary test. His experience had shown him that there was no definite relation between the virulence of the culture and the severity of the case from which the culture was derived. His conclusion was that morphologically, culturally, experimentally, and chemically sufficient data existed which enabled them to say that the Klebs-Loeffler bacillus was the true cause of diphtheria, and to give in most cases a definite positive or negative opinion according to the presence or absence of this bacillus in the exudations. Dr. Hermann Biggs (New York) followed with a paper on the same subject.

SECTION OF PHYSIOLOGY.

THE proceedings of the Section commenced with a discussion upon the Mechanics of the Cardiac Cycle, which was introduced by Professor J. Barry Hoyercraft and Dr. D. Paterson. Professor Hoyercraft showed by three different methods that the ordinarily accepted view that the antero-posterior diameter of the heart increased during systole was incorrect, and that the explanation of these results was to be found in the fact that the experiments were conducted upon animals in which the heart was exposed, and therefore unsupported by surrounding parts, as under normal conditions. He argued that the generally accepted change of position of the heart within the chest during systole was also incorrect. These changes are brought about by the effect of gravity acting upon the flaccid muscular wall of the heart in diastole, and he showed that by varying the position of the animal and therefore of the heart, and by supporting the heart, many other alterations of position could be effected which were all capable of explanation as effects due to gravity. He next entered into the question of the time of contraction of the papillary muscles. Working upon an excised heart of the rabbit and carrying out the experiments rapidly they were able to show that the muscle and the general wall of the heart near to its base of attachment contracted synchronously. Professor Michael Foster criticised the paper, and Dr. Gibson (Edinburgh) showed tracings he had taken in a case of fissura sternali, and thought they showed a distinct change of posi-

tion of the heart within the thoracic cavity during systole. Dr. Paterson in replying to some of the criticisms advanced, believed that for the mitral valve to act satisfactorily, on the one hand, the papillary muscle must contract synchronously with the general ventricular wall. Professor Purser did not consider the explanation given of the observed movements of the heart could account for the fact that the apex beat was more forcible in the prone position. Professor Heymans (Ghent) next read a paper upon the Innervation of the Heart. He showed many photographs and microscopic sections of preparations he had made from hearts of various animals in which he had used Golgi's method to demonstrate the small nerve fibres present. As a result of this research he was able to show three main plexuses of nerve fibres. The first are placed throughout the muscle tissue of the whole heart, and contain nerve cells as well as numerous meshes of nerve fibres; from their number he concludes that each muscle fibre has a separate nerve fibre going to it. A second plexus is found around the vessels, and is vasomotor in function. The third is placed under the endocardium, removed completely from the muscular tissue, and is sensitive in function. Dr. Lauder Brunton pointed out of what great value these researches are in enabling us to understand the action of many drugs upon the heart; for example, the difference of action of laudanum when brought in contact with the endocardium and when painted on the outer surface, when it practically produces no change. Messrs. Bayliss and Starling demonstrated a method of studying local vasomotor changes. A tube is inserted in the course of the artery supplying the organ whose vascular changes are the subject of investigation, and two points of this tube are connected with a differential manometer. The excursions of the lever of the manometer are proportional to the velocity of blood flow through the tube, so that they are diminished by local constriction, and increased by local vascular dilatation. It is necessary to debribrate the blood of the animal before the experiment, in order to avoid clotting of blood in its passages through the tube. Professor Stuart gave an account of some of his work on the measurement of circulation time through various organs. He believed by this method he could obtain a general indication of the circulation time in man—namely, about 15 seconds for the lung, and about 70 seconds for the general system. Professor Hamburger (Utrecht) read a paper upon the Physical Factors of Absorption. He has studied the manner of resorption into the blood vessels, and concludes that this occurs not through osmosis, nor through the vital activity of the capillary wall, but through imbibition. He described a new instrument he had devised to prove his views, in which a small tube with meshes coated thinly with gelatine represented a capillary vessel. Mr. T. B. Lenthes described experiments illustrating the rapidity with which the blood returned to its original volume after the injection of salt solutions. These showed, too, that the changes were not to be accounted for by alterations of the quantity of lymph secreted, but rather by the gain or loss of water, etc., the tissue cells undergo in accordance with the variations in composition of the fluids which bathe them. Dr. Harry Campbell read a paper in which he contended from *a priori* reasons that the resistance to the blood flow due to the capillaries was practically negligible.

SECTION OF ANATOMY AND HISTOLOGY.

PROFESSOR A. H. YOUNG (Owens College, Manchester) opened a discussion on the Development and Structure of the Placenta. He said that our knowledge of the development and structure of the placenta was very incomplete. He exhibited and described a very complete series of sections of embryos of the ferret, etc., and from them he drew the following conclusions: (1) That fetal tissues play a most important part in placental development; they invade, destroy, and devour maternal substance. (2) The ma-

ternal tissues pass through three phases: they exhibit a remarkable activity before the fixation of the ovum; this is succeeded by what may be looked upon as an irritative proliferation, due to the invasion of fetal mesoderm; and finally they disappear in great part coincidently with the epiblastic advance. (3) The relationship between the fetal and the maternal blood streams may be much more intimate than has usually been believed; and, in any case the intervening structures are chiefly fetal. (4) The uterine glands and crypts play a comparatively unimportant part in the placental area. They are not penetrated to any great extent by fetal villi, but their epithelium degenerates and disappears, and is utilised as food pabulum, except at their terminal extremities, where it remains almost unchanged, to serve for the regeneration of the surface after parturition. Messrs. Robinson, Lockwood, and Professor Cunningham took part in the discussion. Mr. T. Manners Smith read a paper on the Anatomy of Three Symphyseal Monsters. Dr. Joseph Griffiths read a paper on the Anatomy of the Genito-urinary Apparatus of the Pig and Boar. He said that a contrast between the accessory sexual glands of the boar and the same glands of the pig castrated when young clearly showed that the testes exert an all-important influence upon the growth and development of the accessory sexual glands, and that the full development of the striped muscle, the ureters, is dependent upon the existence and full development of the testes.

SECTION OF OPHTHALMOLOGY.

A DISCUSSION on the Diagnosis of Orbital Growths was opened by Mr. Swanzy (Dublin). Professor Panas (Paris) continued with a paper on Pseudo-Malignant Tumours of the Orbit, in which he advocated in the case of reputed sarcomata of the orbit previous to operation treatment by mercury, iodine, arsenic, and toxin-therapy, such as erysipelas or streptococcus cultures. Mr. Juler mentioned two cases, one of Carcinomatous Tumour of the Body of the Sphenoid causing Blindness of Both Eyes, and a Case of Acute Orbital Cellulitis following Dental Abscess. Dr. Hill Griffith, Dr. Argyll Robertson, Professor Fuchs, Messrs. Adams Frost, Power, Nettleship, and Spencer Watson took part in the discussion. A paper by Mr. Kenneth Scott on the Radical Operative Treatment of Trichiasis was next read. Mr. Spencer Watson described his operation for trichiasis. Mr. Nettleship asked if the growth of hairs on the transplanted button was a trouble subsequent to Mr. Spencer Watson's operation; he had found it so. Mr. MacGillivray described the operation he performed. A paper was read on Spontaneous Dislocation of the Lens into the Anterior Chamber, by Dr. G. Mackay. Mr. Beaumont read a paper on the Question of Latent Hypermetropia in the Examination of Candidates for the Public Services. After a short adjournment for the examination of cases Dr. Risien Russell gave a demonstration of the results of his experiments on monkeys as to the Influence of the Cerebrum and Cerebellum on Eye Movements. Mr. Adams Frost demonstrated a large series of lantern slides illustrating Ophthalmoscopic Pictures of Various Diseases of the Fundus. Dr. Macnaughton Jones concluded the business of the day by a paper on the Importance of Correcting Errors of Refraction in Neurasthenic Women. Messrs. Ernest Clarke and Johnson Taylor made some remarks.

SECTION OF DISEASES OF CHILDREN.

THERE was again a very large attendance of members, the Theological Lecture Hall of King's College being over two-thirds filled. Dr. H. Handford (Nottingham) read a comprehensive paper on the Nervous Sequelae of Acute Infectious Diseases in Children. In reviewing the subject he pointed out that it had hitherto been treated mainly by neurologists, and that a book on the nervous diseases of convalescents was much needed. He classified nervous sequelae according as they affected (1) the brain and

its membrane, (2) the spinal cord and its membranes, (3) the nerves; and also according to the frequency of these varieties in relation to the various specific fevers. He inclined to think not so much that each fever was followed by its own peculiar sequelæ, as that the organ affected by the virus, and the distribution of the lesions, accounted for the nature of the manifestations under discussion. At the same time there was some evidence of selection of various points of attack by various fevers. An exceptionally good discussion followed, in which Dr. Barlow drew attention to the different periods after or during the fever, when the nervous symptoms appeared. Dr. W. B. Cheadle remarked on the extreme rarity of nervous sequelæ in children. Professor von Ranke said he had an impression that nervous symptoms had become more common since the introduction of the serum treatment, probably because the mortality was smaller. Dr. Fletcher Beach considered that there must be some hereditary endowment as predisposing cause. Dr. Maskey (Brighton), Dr. W. S. Coleman, Dr. Beevor, Dr. J. S. Barry (Manchester), and Dr. Massop, took part in the discussion. Professor A. Baginsky (Berlin) described two cases of Pernicious Anæmia in children. Dr. Archibald E. Garrod and Dr. Fletcher Morris read a paper on the Maternal Factor in Rickets, dwelling especially on errors of lactation as a cause. Dr. J. Kingston Barton read a paper on the Relation between the Foods of Early Life and the Condition of the Teeth. Mr. Sydney Spokes continued the discussion. Mr. Percy Power and Mr. Frederic Eve showed three cases of very great interest. Dr. Thomson (Edinburgh) contributed a rare case of Congenital Hypertrophy of the Pylorus and Stomach Wall. The proceedings terminated by a paper by Professor Comby on the Non-Pathogenic Streptococci and Staphylococci of the Throat of Children. The communications were throughout of great value and interest, and it was a matter of much regret that the time at the disposal of the Section for their discussion was so short.

SECTION OF PATHOLOGY AND BACTERIOLOGY.

The proceedings were opened by Dr. Sharkey's paper on Peripheral Neuritis. He suggested that as it had been shown that few, if any, of the cerebrospinal nerves were exempt from morbid change resulting in sensory and motor disturbance, was it not probable that the sympathetic nerves might be equally vulnerable? Might not many of the so-called functional disturbances of the viscera with their neuralgias, and disorders of secretion and metabolism owe their existence to temporary nerve intoxication, to nerve degeneration and to nerve inflammation, the processes which he considered had a share in the production of what was called clinically neuritis. In discussing the paper Dr. Ord commenced by referring to the association often observed by him of cardiac disorder and gastric ulcer, and suggested that some connection might be found between them in a neuritic or nutritional affection of the vagus. Dr. Russell Wells pointed out the importance of excluding changes in nerves that might possibly be put *marginem* from consideration on the pathology of neuritis; he was followed by Dr. Mott, who maintained that many neuritic affections were toxin effects of the ganglia cells, the peripheral distribution being explained by something analogous to the known laws of nerve degeneration after section of the spinal roots. Professor G. Marinesco (Paris), who happened to be in the room, on being called upon by the President to speak, gave it as his opinion that most cases of neuritis might be referred to an infection or intoxication by ptomaine bodies. Dr. Ormerod having made a few remarks as to the peripheral distribution of neuritis, which he explained on the fact of the peripheral fibres being smaller, and so more susceptible, Sir T. Graham Stewart from a consideration of some clinical facts made several suggestions as to pathology. Professor Hamilton said he con-

sidered that neuritis had nothing to do with inflammation, but was a degeneration due to the action of a poison similar in its action to phallophorus poisoning. Dr. Eliza W. Osabar, having borne out the remarks of the last speaker, Dr. Sandby combated the same, and stated that in his opinion many cases were purely inflammatory. Dr. Sharkey replied. Dr. Copeman opened a discussion on Vaccinia and Variola with a paper on the Pathology of Vaccinia and Variola. He had found it possible to transfer to calves, by inoculating them with the contents of an egg previously inoculated with small-pox crusts, a disease indistinguishable from vaccinia. From the vesicles thus formed other calves were vaccinated, and, finally, some children—all with excellent results, in all cases "taking well." Dr. Sidney Coupland then announced that a series of sections of vesicles were on view in the adjoining room, in which might be seen inside the cells the same organism that was found in the vesicles. The vesicles were both artificially and naturally produced. Dr. Haughton wished to know the cause of variola. He suggested as possible causes of the disease various meteorological and hygienic circumstances, and finally stated that inoculation with vaccine lymph is nothing but a species of "septicaemia poisoning." Dr. Denham pointed out the importance of using young calves in all such experiments, and Dr. Renan having spoken of the possible transmutation of vaccinia to variola, Dr. Drysdale stated that he believed vaccinia and variola to be but different phases of the same disease. After the exhibition of some photographs on the screen of typical vesicles from inoculation, Dr. Copeman replied. Dr. Hunter opened a discussion on Pernicious Anæmia. He said he believed the disease to be due to an active destruction of blood corpuscles in the portal area by the action of a toxin absorbed from the intestine. He laid great stress on the frequency of the extravasation observed in cases of this disease. Dr. Copeman thought the correct view was one intermediate between those of Drs. Stockman and Hunter. Dr. Gibson laid stress on the importance of intestinal antiseptics in treatment. After some remarks by Dr. Stockman, Dr. Hunter replied. The papers of Drs. Macfadyen, Auld, and Furnival were at this point handed in and taken as read.

SECTION OF OTOTOLOGY.

PROFESSOR MACGIVEN (Glasgow) opened a discussion on Cerebral Complications in Relation to Middle-Ear Disease. He drew attention to the fallacies and difficulties of localization, to the importance of the early diagnosis of tubercle in middle-ear disease, and to the necessity of efficient bacteriological examination. He doubted the advisability of depending on the absence of bone conduction in differentiating between cerebral and cerebellar abscess, and insisted on the great importance of absolute removal of all foci of pyogenic infection. He drew attention to the necessity of most careful antiseptic precautions in aurial surgery, and concluded by bringing forward the following propositions: (1) That the extension of infective disease from the middle ear to the brain and its membranes was preventable; (2) that when disease was established in the middle ear it should be thoroughly eradicated; (3) that when brain trouble had been set up, it was necessary to remove not alone the affected part, but also the path by which infection had travelled. Dr. Luc (Paris) mentioned a case of cerebellar abscess with destruction of the petrous portion of the temporal bone and large cholesteatoma in the mastoid antrum. Mr. Marmaduke Shield pointed out the importance of the early diagnosis of tubercle in middle ear disease, the importance of the removal of all foci of infection, and the necessity of careful antiseptic precautions in the treatment of granulations. Drs. Mellingham, McBride, T. Barr, and Dr. Ballance also spoke as to the importance of early treatment of tuberculosis of the middle ear and the necessity of anti-

septic precautions in operating. Mr. Pritchard pointed out that the patients themselves should be impressed with the necessity of carrying out the antiseptic measures prescribed. Drs. Dandas Grant, T. Barr, and Mr. Wood mentioned some cases of cerebral abscess having points of interest, and referred to the alcohol treatment in aural disease. Professor Macewen, in replying, pointed out that it was absolutely the duty of the surgeon to operate in cases of chronic aural discharge, that even in the most advanced cases complicated with serious cerebral mischief there was a chance of success, and that one was not justified in depriving the patient of that chance, however slight it might be, knowing the hopeless nature of the disease.

SECTION OF PHARMACOLOGY AND THERAPEUTICS

THE major part of the business of this Section was devoted to a consideration of the views of the profession with regard to the modifications which would be most acceptable to them in the revision of the *British Pharmacopœia* which is now under discussion. Considering the very academic nature of the subject there was a good attendance of members, and as the views expressed by the speakers all tended to advocate the simplification of the work in question, it is to be hoped that the Committee of Revision will be able to avail themselves of, at any rate, some of the suggestions made to them. Professor Leech, in opening the discussion, suggested that remarks might profitably be confined to a consideration of (1) the nature and extent of the list of remedies; (2) the mode of preparation of compounds, so far as concerned their medical use; (3) weights and measures; and (4) the amount and extent of accessory information to be given. As regards the first point, much information had been gained from the circular recently issued by the Therapeutic Committee of the Association, and there seemed to be a general consensus of opinion in favour of omitting several of the preparations which appear in the present official work. It was pointed out, however, that the omission of any drug, should it be finally decided to omit it, will in no case prevent a man from prescribing it should he see fit to do so. As to the introduction of new remedies, it must be borne in mind that nothing should receive official recognition unless it be proved to be really useful; and it is this principle which has in the past guided the Committee of Selection, and will still continue to do so. As to the tests for detection of impurities, it would probably be well to indicate the exact impurities which the tests were designed to disclose, as is already the case in the American *Pharmacopœia*. In the new edition it would probably also be found expedient to introduce the metric system of weights and measures alongside of the English system. Dr. Donald MacAlister was strongly in favour of simplification, and would advocate any measures calculated to assist practitioners in remembering such vital questions as dosage, etc. He would exclude all such information as is not generally useful, and would rather see the *Pharmacopœia* a work of reference than a textbook of pharmacology and therapeutics. Professor Bradbury thought that in the new edition the question of doses should be very carefully revised, and that the pruning knife might be with advantage used freely in eliminating many little-used substances. Dr. Mahomed thought that the work might be rendered more useful were the number of preparations of a given substance considerably reduced. Dr. Talfourd Jones thought that the present selection of suppositories was a bad one. Some were not needed, and others were not inserted, although often required. Medicated pessaries and bougies might with advantage be included. He also thought that the dose of drugs to be administered by the bowel should be carefully considered. His own opinion was that a smaller dose was often required when administered in this way than when given by the mouth, and drew attention to the risk of administering ordinary doses of a powerful drug like morphine by the rectum. Dr. Charteris regarded the

present edition of the *Pharmacopœia* as antiquated, and requiring very careful revision. The tests for impurities and the official dosage are in many cases incorrect, and introduction of the metric system is highly desirable. The discussion was continued by Drs. Carter, Neville Wood, Maybury, Frazer (Dublin), and Ralph Stockman, whose views were generally in favour of simplification; and Professor Leech briefly replied. Interesting papers were then read by Drs. Apostoli, Balfour, C. D. F. Phillips, Surveyor, and Vaughan Harley, but owing to the lateness of the hour there was but little opportunity for discussion of the matters dealt with.

SECTION OF DERMATOLOGY.

AFTER a sympathetic reference to the Huxley memorial by the President of the Section, Dr. Colcott Fox read an interesting paper on some cases of peculiar Papulo-pustular Eruption in Infants, illustrated by drawings. Dr. Gilbert Smith (Birmingham) followed with the details of a case of Lichen Planus Verrucosus. The discussion on Diet in the Etiology and Treatment of Diseases of the Skin was introduced by Dr. W. Allan Jamieson (Edinburgh), who said that dietetic errors, such as the intemperate use of alcohol and tea, the omission of properly prepared vegetables, etc., could be traced in cases of eczema. He thought, too, that the same factors were at work in alopecia areata. He also examined the influence of diet in the production of other skin conditions, such as boils, etc. He insisted on the importance of feeding girls properly, as there was an idea that they required less food than boys. He strongly held the opinion that the great abuse of tea at the present time was one of the factors in the development of cancer in those predisposed to that disease. Dr. Walter G. Smith (Dublin) read a paper on the Relations of Diet to diseases of the skin. He considered that the importance of food as a factor was exaggerated. He did not think that diet had anything to do with eczema in children. He also objected to such expressions as gouty eczema, gouty psoriasis, etc. Neither did he take such a gloomy view as Dr. Jamieson with regard to the bad effects of tea and alcohol in moderation. He insisted on the importance of idiosyncrasy in giving dietetic directions to patients. In conclusion, he considered very few skin diseases were due to errors of diet; and, further, that hard-and-fast rules of diet were of little value in treatment. These two papers gave rise to a good discussion, in which the President, Drs. Harrison of Clifton, Myrtle of Harrogate, G. Thin, Dockrell, McCall Anderson of Glasgow, Savill, Buchanan, and Stopford Taylor of Liverpool took part. There was a great difference of opinion with regard to the influence of various articles of diet on cutaneous affections. The next paper was that of Dr. Leslie Roberts on the Treatment and Prognosis of Trichophytosis, based on the physiology of the trichophyton. Mr. William Anderson read notes of a case of Adenoma Sebaceum, and described the surgical treatment he had employed. The results were very favourable, the operation having greatly improved the appearance of the patient, in this case a man. Drs. Crocker, Brooke, Waldo, and S. Taylor discussed the subject, and Mr. W. Anderson replied. Alopecia Areata formed the subject of a communication from Dr. Waldo, of Clifton. The President, Dr. Barendt, Brooke, and Harrison took part in the discussion which followed, especially as regards the origin of the condition. Dr. J. H. Stowers read the clinical notes of a case of Dermatitis Repens in a woman, and illustrated his remarks by drawings. Treatment had proved ineffectual. The patient ultimately died of cancer of the stomach. The meeting, which was well attended, was brought to a conclusion by papers on the Etiology of Acute Pemphigus, by Mr. George Pernet; on Cheiro-pompholyx in association with Eczema, by Dr. Edward Mackey, of London; and on a case of Cheiro-pompholyx, by Dr. Barendt, of Liverpool. Preparations

showing the diplococcus found by Dr. W. Bullock in Mr. Pernet's case of acute pemphigus, were shown.

SECTION OF ETHICS.

Dr. R. W. DORRIS introduced a discussion on Clubs, Medical Aid Societies, and Contract Practice. Dr. Dickinson afterwards read a paper on the Provident Principle in Sickness Attendance, and Dr. Pearce on the Sweating of the Profession by various Friendly Societies. In the discussion that followed, Mr. Hemming, Mr. Goss, and Dr. Elliston took part, and a very strong opinion was elicited from the members present against medical aid societies, which were universally condemned. It being reported that Dr. Raye (Banbury), who held one of these appointments, was present at the request of the Section, the President invited him to address the members. He did so at some length, pointing out the conditions under which he held his appointment, showing clearly that, although it had objectionable features, it did not properly come under the category of the associations which were specially condemned. Dr. Philip Lee then gave details of the struggle at Cork between the profession and the amalgamated clubs, stating that over £600 had been subscribed to assist the men of Cork, but so strong was the feeling there, that the profession as a whole should move in this matter, that they were willing to give nearly the whole of this sum to assist medical men fighting the same battle in other parts of the United Kingdom. Dr. M. Greenwood then moved: "That the Council be requested to take steps to prevent members of the British Medical Association accepting posts in medical aid societies, and that in the opinion of the Section no practitioner who accepts office in any society of this kind be eligible for membership of the Association. That medical aid societies be defined to be 'any lay association which endeavours to obtain pecuniary profit for its members solely out of the labour of salaried medical officers.'" It was also moved by Dr. John P. Henry, and seconded by Dr. George H. Broadbent: "That the Council be requested to communicate with the universities and medical corporations, with a view to induce them to insert a clause in their diplomas forbidding, under pain of forfeiture, the taking of offices in medical aid associations, or the taking of clubs without a wage limit or at unremunerative rates, or undertaking any appointment or engagement calculated to degrade the profession." These resolutions were deferred with the others till Friday. Dr. Lattey and Dr. Henry further continued the discussion. Dr. Hugh Woods then introduced the discussion on Hospitals and Dispensaries, and was followed by Mr. F. Greaves and Mr. Nelson Hardy, the latter of whom condemned the use of unqualified practice at hospitals. A strong opinion was expressed by all the speakers against the gratuitous attendance by physicians and surgeons of the patients in the pay wards of hospitals. Dr. Campbell Black read his paper on Hospital Advertising and Medical Etiquette, and Dr. Draper took part in the discussion that followed.

THE HUXLEY MEMORIAL.

At the conclusion of the general meeting of the British Medical Association held at Exeter Hall on Thursday afternoon, the President desired the attendance of the members for the consideration of the proposed memorial to the late Professor Huxley, and introduced Professor Michael Foster, Secretary of the Royal Society, who stated that steps were being taken to raise a memorial to the late Professor Huxley on as broad a basis as possible, but that, owing to the lateness of the season, it had been thought desirable to defer active steps until after the autumn recess. No attempt had been made to determine in any way the nature of the memorial, which must depend upon the amount received, but a Provisional Committee had been formed, and he trusted that the medical profession, of which the late Professor Huxley was a member, and which he

loved, and which whenever possible he helped, would desire to join in this effort to perpetuate the memory of so great a man. Sir John Lubbock had consented to act as Treasurer to the Committee, to whom subscriptions might be paid, and Professor G. B. Homes, of the Royal College of Science, South Kensington, was one of the Secretaries, and would receive names and answer inquiries.

Dr. WARD COUSINS, the President of Council, desired to say he felt sure that the whole profession would respond warmly to the effort to produce an adequate memorial of so great and good a man.

A REPORT

ON THE

MILK SUPPLY OF LONDON

BY A

SPECIAL ANALYTICAL AND BIOLOGICAL COMMISSION.

III.

REPORT OF TWENTY-FIVE SAMPLES OF MILK, EXAMINED AS TO THEIR BACTERIAL FLORA.

By SIDNEY D. ROWLAND, B.A.

THE present research, undertaken at the request of the Editor of the BRITISH MEDICAL JOURNAL, and carried out by the kindness of Dr. Klein in his laboratory at St. Bartholomew's Hospital, does not pretend to be anything like a complete investigation into the bacteriology of the London milk supply. Such an account has yet to be written; it would involve, perhaps, years of laborious work, and would of its very nature never be a complete and definite statement, for at the outset we are confronted with this difficulty—physiologically milk is recognised as the ideal food stuff; it is the pabulum on which all mammiferous animals are nourished in their most tender and susceptible years. This is a fact that is well known to everyone. And it seems that in a similar way it is equally well fitted as the nutrient medium in which bacteria—pathogenic as well as non-pathogenic—can grow and multiply to their best advantage. Accordingly it is impossible to speak of a normal milk bacterial flora, for exposed, as it always must be, to many and various sources of infection, there will continually be the possibility of new forms finding in milk a convenient and suitable nidus, and thus, with the evolution or importation of new diseases, there will exist a corresponding chance of their being found in milk. In fact, we might as well speak of the normal population (bacterial) of gelatine, agar-agar, or any other common nutrient medium. Milk does not possess, or ought not to possess, any population at all; it just depends upon what chances of infection it is exposed to, and on the power infecting organisms have of thriving in it—a power which we have already said is possessed by a very large number of forms.

Consequently it was necessary to restrict the examination to the detection of particular organisms which might be found in any great abundance, or which by their properties might be particularly injurious in their action. Normal milk as it exists in the udder of the healthy cow is perfectly sterile, and cocci have been found in milk ducts, and any microbe that may be found in it must have been introduced from without during the period that elapses from the time of milking to that of consumption by the purchaser. A searching examination has therefore been made for the presence of micro organisms that are either distinctly harmful in themselves or indicative of contamination from impure sources. It is, of course, not to be assumed that because a particular organism was not found that therefore it was absent. In work of this nature, as indeed in all scientific work, it is impossible to prove the proverbial nega-

tive. Any evidence as to purity, therefore, that this report may furnish depends entirely on the use of approved methods and on the individual care of the workers. All that can be said is that certain micro-organisms were found, and from a consideration of these it may be possible to furnish evidence of a more or less conclusive nature as to the purity of any particular sample. More than this it cannot claim, therefore it is well to be careful in drawing any conclusion on a collateral subject towards which the work was not definitely directed.

It is also well to add a word or two on the impression that may be produced on other than medical readers. When a subject of this kind is discussed, the technically uninformed mind (struck, maybe, for the first time with the fact that bacilli exist, and having heard that certain of them possess at least a doubtful reputation) is apt to come at once to one of two conclusions—either that we are all on the verge of being poisoned, or that for purposes of their own the medical world is bringing a scare on the public. It is, of course, needless to say that either of these conclusions is, on the face of it, absurd. What we wish to call attention to is not that our milk supply is not perhaps as good as it might be, but that it is not the best possible.

In dealing with our minute and ubiquitous foes, absolute measures are alone of any value, and the smallest breach in any system of prophylaxis is sufficient to admit whole armies of the enemy. What we require, therefore, is to be in a position of absolute security, and to be ready to meet all and every emergency. To do this our safeguards must be of the most accurate description, not admitting the smallest deviation from perfection. Anything less is of so little value that it may be almost said to be useless.

SOURCES OF CONTAMINATION.

The risks to which milk is exposed in the way of microbial contamination are very numerous. Perhaps the largest number are introduced at the time of milking, which is what might be expected considering the way in which this operation is usually carried out. Sedgwick and Batchelder, who investigated the Boston milk supply in 1892, found that when the milking was done in a clean stable, and received into a sterilised bottle, the average number of micro-organisms present was 530 per cubic centimetre; but if no special precautions were taken it rose to the astonishing number of 38,500 per cubic centimetre. Whence come this extraordinary number of bacteria? It is not difficult to imagine their source if for a moment one recalls the usual conditions of the cows, in even the cleanest and most hygienically managed of our dairies. The stable or cowshed in which the milking is usually carried on is itself saturated with excremental matter, the very straw the animals stand upon is too often but an incubating ground for micro-organisms; for warmed by fermentation, and saturated with faecal matter, it offers all the conditions of warmth and nutrient material for their best growth. The restlessness of the animals and the walking of the milkman disturb at each moment myriads of these micro-organisms, some of which passing into the open pail, find in the warm milk all the conditions for life and active multiplication. That this is not an exaggerated picture will be evident when we state that fully 90 per cent. of the organisms found are the *Bacillus coli communis*, the common inhabitant of all excremental matter.

Other sources of infection are to be found in the dirty hands of the milker, unclean dairy utensils, and in the insecurity and carelessness commonly employed for the transit of the milk from the dairy to the consumer. In the case of London milk at least, this always involves a railway journey, with sojourns on crowded platforms and ill ventilated goods-sheds and vans, so that it is not difficult to imagine that means of infection are neither infrequent nor inconsiderable. Indeed, it may even be remarked that with such a unique medium and so many roads of access it is remarkable that there are not more epidemics traced to milk than those hitherto recorded; and it is only just to say that, considering the difficulties in the way, it is remarkable that our daily supply is as good as it is.

METHODS OF INQUIRY.

In all cases the milk was bought over the counter in the

usual manner, the collector being furnished with sterilised bottles. It was brought back to the laboratory at once, and an examination made as soon as possible, it being kept during any unavoidable interim in an ice chest to avoid the possibility of incubation at a living temperature.

EXAMINATION.

A drop of milk removed by a sterilised platinum loop was introduced into nutrient gelatine. This was then liquefied, and poured out into a plate after the usual method. The plates were then incubated at 21-22° C. and examined as soon as copious growth had taken place.

PHENOL METHODS.

It was soon found that many of the plates were spoiled by the rapid liquefaction of the gelatine. It was consequently necessary to avoid this if any but liquefying organisms were to be looked for, and as many were suspected and found, these methods were subsequently adopted.

EXAMINATION OF PLATES.

The plates as thus prepared were carefully searched under a low magnifying power. Subcultures were made from any suspicious colonies, and subsequently identified, if necessary, by further subcultures.

AVERAGE NUMBER OF BACILLI FOUND.

The average number of bacilli found in the samples examined was 500,000 per cubic centimetre. Previous researchers have put the number found in other milk supplies at somewhat higher figures, but it must be remembered that in any numerical examination the sources of error are very numerous. Among such sources the following is perhaps the most important. As already stated, bacteria find in milk all the conditions necessary for rapid multiplication. The rate at which bacteria can multiply is hardly conceivable. Kohn calculated that a single germ could produce by simple fission two of its kind in one hour, in the second these would have multiplied to four, and in three days they would form a mass that can scarcely be reckoned in numbers—or if reckoned scarcely imagined—4,772,000,000,000,000 (TWENTY SEVEN TRILLIONS). Hence it is readily understood that the numbers found in any given sample of milk must vary enormously, according as the sample was examined soon or late after its being drawn from the cow, and according as it had been kept at an incubation temperature (that is, at such a temperature as is most favourable to multiplication, namely, 37° C. for most forms) or not. Hence the number found may only afford evidence of its having been kept carelessly by the vendor; but still such evidence is hygienically useful. We put the number, then, at 500,000 per c.c.m., and when it is remembered that the number found by Sedgwick and Batchelder in freshly drawn milk was 38,500 per c.c.m., it will be seen that considering the vast possibilities of multiplication our milk compares very favourably with other samples in this respect. Indeed, all the evidence we have goes to show that the faults of the London milk supply lie chiefly with the careless hygienic arrangements which obtain in farms, railways, and dairies, and which allow the entrance of the various forms which we have found.

THE MOST IMPORTANT MICRO-ORGANISMS FOUND.

The Bacillus Coli Communis.—This was the form that was found in the greatest abundance, it constituting fully 90 per cent. of all the forms found. Its presence is not difficult to account for when we remember that this organism is the one which is *par excellence* diagnostic of faecal contamination, and when we recall the picture above given of the conditions attending an ordinary milking operation. Its presence in milk is thus easily accounted for, and the question arises, What does its presence signify? Now, the colon bacillus if found in potable water is usually taken as diagnostic of sewage contamination, but its presence in milk cannot thus be summarily dealt with, it having such ready access directly from the soiled cow and its surroundings. Its presence, then, means for the most part that adequate care is not taken of the cows and cowhouses in the dairy from which the sample in which it was found came. It may be objected that it is practically impossible to take such care that the

colon bacillus can be absolutely excluded; undoubtedly it is, still it is an imperative duty which must be carried out if we are to have anything like a sterile milk supply. It may again be objected that a bacillus which is present normally in the intestines of the most healthy of us can do no possible harm if introduced from without. Such a contention would not for a moment hold good. It is a very different thing to possess a normal quantity of a certain constituent, and to possess a quantity that is abnormally large. It might with equal justice be argued that, because we already possess indol in our intestines, that this is a desirable article of food, or that because we possess blood corpuscles therefore it is a good thing to have our vascular system crowded with them; but we all know that too many corpuscles are just as injurious as too few; and the same applies to the colon bacillus. Besides it has been clearly shown that many of the milder forms of disease are closely dependent on the presence of abnormal quantities of the bacillus coli communis. It will be sufficient to mention, among many others, its determining action in many cases of cholera nostras (Gilbert and Grover), cholera infantum (Lesage), cholera infantum (Charrin and Roger), etc. In fact its role in abnormal quantities is by no means a small one, and its presence in milk, especially in such milks as might possibly be used for infant feeding, cannot but be a grave source of danger. We therefore insist that the quantity of bacillus coli communis present in London is dangerously large, both in itself and for that which it represents and portends, and that means ought to be taken to reduce the same.

Liquefying Organisms.—These were similarly present in every sample examined. The extent to which they were present varied in each sample, and such an extent, we think, can be taken as a very fair criterion of the purity of any given sample. The commonest species were varieties of proteus. The significance of these forms is not hard to see. The forms now known as proteus embrace many of those formerly collectively known as bacterium termo; they are found in putrefying organic matter of all descriptions, and their distribution is very wide. Their presence in milk must mean one of two things, either direct contamination with putrefying matter (stale milk such as might occur in improperly washed dairy utensils, etc.), or needless exposure to an atmosphere containing particles of decomposing matter. Both of these possible channels of infection are such as might, and most certainly ought to be, successfully guarded against; and it is not possible to find the same excuses for the presence of liquefying forms as in the cases of the colon bacillus.

Bacillus Fluorescens.—This form was similarly present in all the samples examined, and its significance, while not so conclusive as that of the two previous forms, is yet worthy of note. Bacillus fluorescens is an aerobic form, distinguished by a particular sensitiveness to want of oxygen. It is frequently present in potable water; hence its presence may be taken as presumptive evidence of added water—but as presumptive evidence only, as its distribution is far too wide to allow of any such definite statement.

PATHOGENIC FORMS.

In two of the samples was found *oidium albicans*, the exciting cause of thrush. It is not possible to say whence this organism found entrance, as so little is known of its life-history, but its presence calls forth the same remark and teaches the same lesson as the presence of the other forms. Its pathogenic properties give it special significance.

The conclusion of the whole matter is this: Not even the smallest of the dangers we have pointed out can be considered trivial, peremptory precautions are futile, and we would again insist that the same weak spots in our system of defence, which in times of microbial peace admit but comparatively harmless varieties, may in times of microbial war and epidemic disease allow the entrance of forms which in their life-action may be the cause of large disease diffusion and of frequent sporadic outbreaks.

PROPOSED REFORMS.

1. That all milking be carried on in the open air, the milks and operators being on a material which is capable

of being thoroughly washed, such as a floor of concrete or cement. Such a floor could be easily laid down in any convenient place which can be found. The site chosen should be removed from inhabited parts as far as possible and should be provided with a plentiful water supply. Only in this way does it seem possible to avoid the initial contamination with the colon bacillus.

2. That greater care be expended on the personal cleanliness of the cows. The only too familiar picture of the animal's hindquarters, flanks, and side being thickly plastered with mud and feces is one that should be common no longer. It would not be difficult to carry out this change; indeed, in the better managed of our large dairy companies' farms such a condition no longer prevails, but in the smaller farms it is but too frequently met with.

3. That the hands of the milker be thoroughly washed before the operation of milking is commenced, and that after once being washed they be not again employed in handling the cow otherwise than in the necessary operation of milking. Any such handling should be succeeded by another washing in fresh water before again commencing to milk.

4. That all milk vendors' shops should be kept far cleaner than is often the case at present. That all milk retailing shops should be compelled to provide proper storage accommodation, and that the counters, etc., should be tiled.

SKIMMED MILK IN WORKHOUSE INFIRMARIES.

A CORRESPONDENT writes to us: Knowing the deep and practical interest you take in the reform of our workhouse infirmaries, I know I need offer no apology for troubling you. For many years, nothing but skimmed milk has been supplied to the inmates of our workhouse infirmary. The cream is taken off and used by the officers of the house, either as cream or after being converted into butter. As a member of the Board, I am anxious to have this state of things altered, but I am at once told that skimmed milk furnishes all the nutriment required. Further, I may say that the milk is sometimes twenty-four hours old when used in the infirmary and is at times sour, but the inmates must either consume it or have nothing. May I venture to ask, as the result of your large experience, whether you know of any other workhouse infirmary where skimmed milk only is supplied, and whether you consider this is a proper state of things to exist, and one that the medical inspector of the Local Government Board would approve of?

MILKBORE DISEASE:

AN APPEAL TO MEDICAL OFFICERS OF HEALTH.

MR. ERNEST HART is engaged on a general inquiry into milk-borne disease since 1881, in continuation of his paper of that year on the Influence of Milk in Spreading Zymotic Diseases, and will be much obliged if those health officers who possess notes of outbreaks of disease traceable to the agency of milk will be good enough to furnish him with a brief statement of the facts, so far as known, in the shape of answers to the questions subjoined:

- | | |
|--|---|
| 1. Date. | 8. Number of such families involved. |
| 2. Locality. | 9. Summary circumstances of farm or dairy from which milk was obtained. |
| 3. Reporter. | 10. Favouring cause of outbreak. |
| 4. Total number of cases. | 11. Circumstances attending milk. |
| 5. Deaths. | 12. Facts showing special incidence of disease. |
| 6. Number of cases amongst drinkers of suspected milk. | 13. Reference to report. |
| 7. Number of persons supplied by milkman. | |

THE STEWART PRIZE.

The Stewart Prize for 1885, consisting of an illuminated address and a cheque for £50, was awarded to Brigade Surgeon-Lieutenant-Colonel D. Douglas Cunningham, M.B., C.I.L., F.R.S., for his bacteriological work in India, especially in the investigation of the bacillus of cholera. In the absence of the recipient the prize was received on his behalf by Surgeon-General Cornish.

SIXTY-THIRD ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION.

Held in London, July 30th and 31st, and August 1st, 2nd, and 3rd.

FIRST GENERAL MEETING OF MEMBERS—TUESDAY,
JULY 30th.

The first general meeting was held on Tuesday afternoon, July 30th, at Exeter Hall, Strand, the PRESIDENT (Dr. Long Fox, M.D., F.R.C.P.) in the Chair.

The minutes of the last general meeting were taken as read and confirmed.

Retirement of President.—Dr. EDWARD LONG FOX, in thanking the members of the Association for the great honour done him during the past year, expressed his deep appreciation of the kindness shown to him by the Council, Treasurer, and General Secretary and Editor of the JOURNAL, and of the pleasant way in which they had condoned his many shortcomings. Sir Russell Reynolds, who was about to succeed him in the Presidential Chair, was known wherever the English tongue was spoken, and his name and life work throughout the whole medical world were household words. He was sure that the meeting, which was by far the largest ever held in the history of the Association, would manifest in no measured way the delight they all felt in having so great a man as its President.

Installation of New President.—Dr. LONG FOX then vacated the Presidential chair, which was taken by Sir Russell Reynolds amid the applause of the assembly.

The PRESIDENT (Sir Russell Reynolds), in acknowledging the compliment just accorded to him, said he felt it was a high honour to be called upon to occupy the chair of the Association, and one which he was delighted to accept when it was offered to him last year.

Sir WILLIAM HINGSTON (Montreal), in proposing a vote of thanks to the ex-President, said that Dr. Edward Long Fox was one of the oldest members of the Association. He had been an active member of the Council, and by his exertions had added much to the success of the Bristol meeting last year. He begged to move:

That the cordial thanks of this Association be given to Dr. Edward Long Fox for his services so ably and courteously rendered, and that he be and is hereby elected a Vice-President for life.

[Applause.]

Mr. HENNING, in seconding the motion, said that those who attended the meetings at Clifton must have been struck by the extraordinary courtesy, hospitality, kindness, and yet firmness which Dr. Long Fox displayed both at home and in the chair. Dr. Fox's reputation as a physician was too well known to need his passing any encomiums upon it, and he was sure everyone would most cordially unite in wishing to bestow the highest honours that could be conferred by the Association upon that gentleman.

The motion was carried by acclamation.

Dr. LONG FOX said it was one of the most difficult things in the world to return thanks gracefully, but he assured the members that he was most grateful for the kind manner in which the resolution had been received, and of course it would be an honour for the rest of his life to be a Vice-President. He was deeply pleased that the motion should have been proposed at that meeting of the Association, which was far and away the most important that had ever been held.

The Report of Council.—Dr. WARD COUSINS (President of Council), in moving the adoption of the report and financial sheet, said he was glad to report that the British Medical Association, had made great progress during the past year; they had extended their boundaries, and never at any moment of their existence were so firm and united and compact in their union. There were now, he was proud to say, 16,000 members scattered over the world [Applause.] The Association was now the largest and strongest medical organisation in the world. [Applause.] When they met in London in the year 1862, with the late Sir George Burrows as President, the Association numbered

1,500; in 1873, when the late lamented Sir William Fergusson was President, 5,400; and now they met with the grand total he had mentioned. The JOURNAL also had made progress during the past year. It had increased in vitality, and it had increased in every sense of the word, by its appreciation throughout the whole of the Association. The members had no doubt read with great interest the reports in reference to many interesting investigations, but he would only mention one—the very important report upon the condition of the provincial workhouses. He was confident that there were thousands of the sick and the aged who, in their loneliness, had been benefited by the report. [Applause.] The report called forth, also, the activity of the local authorities towards modern improvements. The JOURNAL contained a brilliant line of transactions; there were discussions on every medical and surgical topic of the day; there were opinions from the very best authorities, and the members could see the progress of those splendid sciences which now throughout the world were moral forces as well as infinite benefits to all mankind. [Applause.] The Parliamentary Bills Committee had considered many important questions, but he was inclined to think that the dissolution of Parliament, postponing many of those important questions at present, was a great relief to many of them. [Laughter.] One matter, at all events, had been most carefully considered by the Committee, a matter near to the heart of all, and that was the amendment of the Medical Acts. It was certain that when the right time came the whole force of the Association must be in the direction of modifying those Acts. Nothing was more distressing than to see the sick and the suffering under the influence of fraud and injustice, and it was on public grounds, not merely as a matter of professional protection, but on general, broad, public grounds that they wanted the Medical Acts amended and reformed. [Hear, hear.] There was another most important matter which the Inebriates Legislation Committee had had to deal with. The late Lord Chancellor promised to introduce the Bill of the Committee into the House of Lords, but unfortunately it was now postponed. He was quite sure that all the members of the Association would rejoice when the detention of habitual inebriates became adapted by the Legislature—[applause]; he was confident the members would be glad when it was in the power of the County Council to provide retreats for that unfortunate class, and when by magisterial decision, and by judicial decision likewise, the poor might be sent to places where they might be submitted to therapeutic treatment, instead of being sent to gaol. [Applause.] No doubt 80 per cent. of the cases that appeared in the police courts were associated with drunkenness, and a thousand times over that class came before the police courts and were sent to prison. Prison was neither deterring nor reforming. And why? Because in this land of Christian light and Christian sympathy there was no place and no power to help them. [Hear, hear.] He was confident that the British Medical Association would never cease its voice; he was confident that they would ever do their utmost to promote that righteous cause. He sincerely hoped that their old friend Dr. Norman Kerr—[applause]—would in a few years be successful in the great work to which he had devoted his life. [Applause.] Excellent results had been also obtained by the Committee for the Examination of School Children. He sincerely hoped the members had looked at that report; 100,000 school children had been examined with regard to their peculiarities of mind and body, their deficiencies, their deformities, their constitutional tendencies, and the report was full of the most interesting matter and interesting recommendations. The report had been sent to the Local Government Board and to the London County Council. Children were not all cast in the same mould, and those who were unfortunately labouring under these deficiencies required special care and training. The Council received during the early part of January a deputation from the South of Ireland respecting the unfortunate matter of benefit clubs, and he need not say that the Council received the deputation with the greatest cordiality, and expressed sincere sympathy with those who had been compelled to resign their appointments. The assistance the members had given their associates in the South of Ireland had had a most excellent result. It had sustained and helped

them to fight the question shoulder to shoulder as an example to the associates in all parts of the kingdom. From communications he had received during the last few days he thought they had every reason to believe that in the long run the Association at Cork would gain the victory. [Applause.] It was time that the British Medical Association and the Council should take into consideration all the questions which agitated the profession for medical reform and benefit societies, because it was only in that way, by combined action and by united voice that they could help to protect the interests of their associates, and help them in time of need. The Council thanked most heartily the officers of the Branches in all parts of the world for the assistance they had given them during the past year, and he need hardly say that without their assistance and help it would be impossible to manage so large an administration as the British Medical Association had grown to. Their grand purpose would be to unite still more and more by common sympathy and mutual confidence, and then they hoped that in a very short time every qualified practitioner in the British Islands would be a member of the Association. [Applause.] It was their desire to absorb them all, and they would make them also, if possible, special practitioners in that simplest of all the branches, a branch which on the present occasion was honoured with a section, a branch of which the top and the bottom, the length and the breadth, the centre and the circumference, and the very kernel was simply "to do to others as we would they should do unto us." [Applause.] The members had to lament the loss of 200 of their associates during the past year. In that number their old friend and colleague, dear to many of the members of the Association, Mr. Arthur Durham—[applause]—was included, and also their lamented colleague, Dr. Withers Moore. [Applause.] Dr. Withers Moore was President of the Association in 1886, at Brighton, and was also Vice President of the Council. Dr. Withers Moore's successful career was known to all the members. He was devoted to the interests of the Association, and he (Dr. Ward Cousins) had often heard him say, "Our profession is a noble calling, and worthy of the devotion of a lifetime; but you know it has its vexations, it has its troubles, and it has its disappointments." Yes, but still, after all, they might have more mutual confidence, they might grow firmer in their union; and although, perhaps, they might not be able individually to help on the great march of science, or command extraordinary success, they could have the highest of all professional aspirations, and that was to obtain the confidence of their brethren. [Applause.]

Mr. BUTLIN (Treasurer) in seconding the motion, said it would be seen from the financial statement that if any misfortune should happen which caused the Association to be wound up, they would wind up with about £60,000 of assets above their liabilities. Something under £50,000 of that only, however, was available for purposes of the Association. At the present moment the Association was not only in a condition of comfort but was approaching a condition of prosperity, but not such great prosperity as some members of the Association imagined. The profit during the year carried to the balance sheet was between £4,000 and £5,000—less than in the previous year.

Dr. DOUGLAS asked when the reports now before the meeting first appeared in the *JOURNAL* of the Association.

Dr. WARD COUSINS said that they were published last Saturday.

Dr. DOUGLAS said that a great many members of the Association who took an interest in the general business of the Association frequently found it impossible to read the reports before coming to the meeting. He trusted that the Council would take the matter into their consideration, and that the various reports would in future be published earlier, so that intelligent medical practitioners having read and digested them, could say "Aye" or "No" as they might feel right and proper.

Dr. WARD COUSINS assured Dr. Douglas that the matter would receive the attention of the Council.

Dr. COLIN CAMPBELL, in calling attention to the non-publication of letters in the *JOURNAL*, particularly with reference to the question of the registration of midwives, said

that the complaint was in no way a personal one, for he had been treated with the utmost courtesy. One document, however, of vital importance had been suppressed. A Committee of the Lancashire and Cheshire Branch, numbering 100 members, called the attention of the Branches at large to the very important omission which occurred in the draft Bill for the amendment of the Medical Acts. That draft Bill, which was prepared by the Parliamentary Bills Committee, at once rendered legal the assumption of medical titles. The Committee of the Lancashire and Cheshire Branch were the first to call attention to the fact that what was wanted was not the penalisation of titles, but the penalisation of practice. They did not care what a man called himself, but as soon as he proceeded to practise illegally, without examination and registration, then the common law of the land should make him liable. A motion was proposed by Mr. Walter Whitehead at a meeting at Liverpool, but prior to Mr. Whitehead putting it to the vote, he (Mr. Colin Campbell) as Secretary to the Committee, sent a whole series of improvements upon, and amendments to, the Parliamentary Bills Committee's draft Bill, and they were entirely suppressed, while the actions of a society called the Midwives Registration Association appeared prominently week by week. Another matter to which he wished to call attention to was the fact that for several weeks past an advertisement had appeared in the *JOURNAL* from a gentleman whose name had been removed from the *Register*.

Dr. WARD COUSINS said that the greatest care was taken by the management and Reference Committee with regard to the insertion of advertisements, and the matter referred to by Mr. Colin Campbell would be duly investigated.

Dr. R. R. RENTOUX said he was strongly opposed to the appointment of the Reference Committee, because if any complaint were made it enabled the Editor to go behind it, and say, "You must blame the Reference Committee." They had an editor who was paid £1,500 a year—[No, no]—and he ought to be held responsible. He thought the meeting would be in order if it recommended to the Council that either the Reference Committee should be entirely abolished, so holding the Editor entirely responsible, or that some one more in harmony with the body of the profession should be appointed. Another point to which he wished to call attention was the large sum for editorial expenses. In 1884 the editorial expenses were £2,681, last year they had amounted to no less a sum than £5,918. He hoped, too, that the Council would take some steps to see if it could not vote £500 or £1,000 to help Dr. Anderson to fight their battles.

Dr. WARD COUSINS explained that Dr. Anderson's case had on many occasions come before the Council; the best legal opinions had been taken, but by the present Memorandum of Association they were unable as a body to give Dr. Anderson any pecuniary support.

Dr. HORDER asked what was the length of the lease of the premises in the Strand.

Surgeon-Major INCE said he should like to know what was the exact salary of the Editor.

Mr. BUTLIN said that the lease of the premises in the Strand had something under ten years to run. There were two or three reasons why the expenses of the editorial department had increased during the last ten years or so. In the first place, the number of pages in the *JOURNAL* had been increased, and an enormously increasing quantity of material was sent in for publication, and a great part of the duty of the editorial staff was to prepare that material for publication in the *JOURNAL*. Mr. Ernest Hart's present salary was but £750, and with contributions amounted to, perhaps, about £1,000 a year; but it must not be forgotten that for many years Mr. Ernest Hart had worked up the *JOURNAL* on the very smallest possible salary, very much below his merits as an editor, and very much below what he ought to have received. It seemed only reasonable that now they could afford to pay him they should do so. [Applause.] Under the head of editorial expenses were included all the expenses of contributors, and such matters as clerk's salary, reporting, engraving, woodcuts, stationery, postage, and the like; £1,900 or £2,000 a year were paid to a large number of persons who contributed not only from all parts of the country but from all parts of the world.

He admitted that the JOURNAL cost a good deal of money; but he did think, considering the enormous value it had been to the Association, and its admitted excellence as a medical journal in every part of the world, they were not extravagant.

The motion for the adoption of the report was then put to the meeting and declared by the President to be carried.

General Practitioners Committee.—Dr. WARD CORNS, in moving the adoption of the interim report, said that he might fairly divide it into two parts: first, the opinion of the Council upon the registration of midwives, and, secondly, their opinion on the prosecution of quacks—what was called medical defence. There had been a Midwives Registration Bill before Parliament, but Parliament was dissolved, and therefore there was no such Bill before Parliament or before the Association. Many members were in favour of the registration of midwives—and a very large number were opposed to it. The Council had given days' and nights' consideration to the topic, and their first conclusion was that the present state of things was intolerable and that a change was absolutely necessary. The next clause of their opinion was that a scheme might be developed by the Association, or the Council, or the Parliamentary Bills Committee, which would include the registration and education of all classes of nurses—medical, surgical, and midwifery. [Hear, hear.] The Council recommended the title "midwifery nurse" and excluded altogether the title "midwife." The third clause was a very important one—that the Council thought that the care of parturient women should not be in the hands of any intermediate class of practitioners—[cheers]—that they ought to be committed to the care of properly qualified medical men and ladies. [Hear, hear.] The Council did not expect that every case of midwifery would be attended by qualified practitioners, but they wished that every registered nurse should be in touch with a qualified practitioner. Upon these three clauses the force of the Association might be brought to bear, when the right moment came, to modify a scheme which would be satisfactory to all members. They were all agreed that the profession of medicine was unprotected—quacks had pretty much their own way—and, until there was a modification of the Medical Acts, quackery would still have its own way. No power whatever could control quackery in this country as it ought to be controlled, not for the sake of the profession, but for the sake of the public. All their claims for the suppression of quackery were simply claims for the suppression of injustice to the sick, and on public grounds they earnestly desired an amendment of the Medical Acts so that prosecutions could be satisfactorily carried out. There was a great difference of opinion in the Association as to what authority should prosecute quacks. Where was the power to come from? Was it the General Medical Council? The General Medical Council had no statutory powers at all to deal with quackery, and he did not suppose they wanted them. The question was a very old one, which came up in waves. The wave which had recently started came directly from the Branches. Many members said the right body to prosecute was the British Medical Association. The Council had taken the very best legal opinions upon the course they should take. Under the present Memorandum it was absolutely impossible to spend one farthing in that direction. For sixty-three years the high and honourable purposes for which the Association was established had been successfully carried out; it was now the largest Association in the world, and they ought to be careful to consider the question in all its bearings. It was not impossible to alter the Memorandum; there were legal formalities to be gone through, but he did not press the question of difficulty in such alteration but the great necessity for action in that direction.

Mr. COLIN CAMPBELL asked why they did not go in for a charter.

Dr. WARD CORNS said he had received communications on the subject, stating that the Association was to maintain the honour and interests of the profession, and surely if that were so, would not an amendment of the Medical Acts tend to that end? The Council had had the best legal opinion upon that, and altering one word of the Memorandum for the purposes of spending any moneys in the direction of the

suppression of quackery would be just as difficult and just as complete as if the whole of the purposes of the Association were changed. [No, no.] That was the legal opinion. Nothing but complete and entire alteration of the Memorandum could possibly be done if the question were entertained for a moment. It might be said, Why did not the Council appoint a subcommittee to undertake medical defence? Supposing their organisation extended only to the British Isles, it would be a different matter, but it extended over the British Empire, and over the British Empire they found quacks. They had branches in Europe, Asia, Africa, and America, and survey the question of the prosecution of quacks all over the world would at once suggest to members the necessity for action. The Council did not consider it would be their duty to entertain that question unless it came from one general and practically unanimous expression of the Association—[No, it has.]—from all parts of the great organisation, for they could never expend their money for prosecution in a part of its area. The Council would never recommend the alteration of the Memorandum if it in any way endangered the high and noble objects for which the Association was originally developed. Very few members throughout the length and breadth of the organisation had yet shown any interest in the administration. When the Council had resolutions sent up from branches, they were not the expression of the whole of members of the Branches, and they had abundant evidence to show that there was no unanimity of opinion upon the question of the prosecution of quacks. He could speak for his own Branch. When those resolutions had been passed there were only a little handful of men present. At the annual meeting they listened to the eloquence of those who delivered discourses, and then when the administration came on there was a regular stampede, and the Council was left with a handful of old friends, with whom they kindly wrestled every year or two. That was the way in which the administration had been carried on for years at the annual meeting, and he had never yet had the honour of addressing so large a body of members as on that day. The Council felt that the time had come when the strength of the Association should be drawn into the necessity of modifying the existing Medical Acts. But until they had done that as an Association by putting pressure upon the Legislature, they would never get the modification. In the meantime he hoped that members would join the defence unions already doing excellent work. [Cheers.] They stated in their report that the General Medical Council was made up of the privileged classes of the profession, and so it was. The Association had been nobly represented by Sir Walter Foster and Mr. Wherhouse. [Cheers.] In British Columbia the Medical Council not only managed the examinations of the district, not only kept the register of the qualified practitioners, but enacted a small tax which was utilized for the suppression of quackery. Happy the practitioners who practised in British Columbia! The Council was deeply interested in the question, which affected the bulk of the general practitioners, and he was quite confident that they would do their utmost to give every consideration to it, and that the vexations which attacked many members in all parts of the kingdom would receive their earnest investigation, and he sincerely hoped they would ultimately lit upon some most safe and specific remedies. [Cheers.]

Dr. SACKNEY, in seconding the motion, said he did so with much pleasure, as he had worked upon the Committee very steadily from its beginning, and had every reason to believe that the report would be accepted, and would be regarded as really a worthy interim report. They had given to them a list of something like fifteen or sixteen subjects, which were said to be the grievances of general practitioners, and the Committee—a body of men living in various parts of the country—had to go up to London at various times and discuss those questions. They found that those questions presented extraordinary difficulties; many of the members looked at them from entirely opposite points of view, and it was not until they had had four or five meetings that they came to something like a common standpoint, and therefore he thought they ought rather to be congratulated upon having got so far on with the report. He sympathised very much with Dr. Douglas, because he himself regretted that the report had

not been placed in the hands of members earlier. It was a great grievance to the Committee, who had worked so hard, that the report should not have been put in the hands of members before. Although they sat on the opposite side of the platform, they agreed with a great deal of what the members said, and it was not their fault things were not altered. The two most important things they had dealt with were the midwifery question and the prosecution of quacks. They had dealt with the midwifery question tentatively: there was a great difference of opinion about it. He believed that their proposal that midwives should be put on a register together with all other kinds of nurses was the best solution of the difficulty; at any rate, it was a reasonable one for the present. The other question was as to the prosecution of quacks, and whether the funds of the Association should be devoted to that. He was in favour of medical defence—he had been a member of medical defence societies since their start—and was very anxious, if he could, to find some means of doing what was wanted, but after due consideration he found the practical difficulties became greater and greater. He was willing to vote for any resolution which said it was desirable that the British Medical Association should undertake those duties, but when he said they were to do so, he saw grave difficulties. It was not a question of desirability, but of practicability. No one knew better than Mr. Lawson Tait the great difficulty there was in the prosecution of quacks. Another great practical difficulty was the want of local knowledge in questions of medical defence.

Mr. Lawson Tait said that Dr. Saundby, in speaking on midwifery registration, defended the Council against a charge that was made by a voice from the audience, that their position now had been arrived at under pressure. Whether it were or were not the fact that the phrasing of the Council did appear before pressure was put upon them by the wording of the resolution, yet the dates of the origin of the pressure would not justify Dr. Saundby's conclusion, because there was evidence in the management of the Association that pressure was exercised pretty actively on the other side. [Cheers.] He saw a paragraph from some unknown but experienced canon, and he put the appearance of the paragraph as a very striking corroboration of the charge which Dr. Rentoul made of the suppression of pressure from their side of the question. It was the kind of argument which appealed to a child, not to a grown person. They were told that a number of babies were found distributed in conditions more or less of maturity over the area of the metropolis, and the conclusion was that because those babies were so distributed there was reason to believe that the law regarding the registration of the births of children should be more strengthened, so that all births, including stillbirth, should be registered; further, that midwives should be registered, under proper examination, and should be compelled to notify the births of all children. The next paragraph his eye rested upon was one stating that a box containing the body of a child was found in the garden of a cottage in Monmouthshire, formerly occupied by the sexton of a Baptist church. That was the third body unearthed during the week in the same garden, and excavations were still proceeding. An inquest was held on the first body discovered, and the sexton in question was present and calmly admitted that he had buried scores of bodies in that manner. Would he be thought a reasonable person if he said that on account of that the sextons were to be turned into a low grade of medical practitioners? Yet that was the kind of argument that was being used, and, although the position now occupied by the Council might be that of genuine conviction and conversion, he regretted to say that that conviction had been but scantily evident in its growth and the conversion was somewhat tardy. It was on record in the minutes of the Clifton meeting that a resolution was passed by a general meeting condemning the principle of the registration of midwives, and it seemed a most extraordinary thing that the conviction of the Council should be perfectly genuine—which he assumed it must be—when they attended the Parliamentary Bills Committee, after that resolution was passed, to draft a Bill of its own. They were told that these resolutions were binding not only upon the authorities of the Association but upon their members. If so, why was the resolution passed last year not binding

upon the Parliamentary Bills Committee? The action of that Committee ought to have been at least to have consulted further the general voice of the Association before it gave cognisance to any shape or form of a Midwives Bill. He asked the ruling of the President as to whether or not his resolution, or rather a part of it, should not come on then as an amendment to the Council's report. [Hear, hear.] The President bowed his acquiescence, and therefore he moved:

That we, the members of the British Medical Association, while anxious to improve the training and supervision, and, if need be, to support a practical scheme for the registration of medical, surgical, and midwifery nurses, emphatically condemn any proposal which has for its object the formation of a class of medical, or surgical, or midwifery practitioners other than those recognised under the Medical Act, 1858, as now existing.

They had been told that no Midwifery Bill was now before the Association or before the country, and that of necessity took the middle part out of his resolution. They had heard much of the technical difficulties of the Council, who, when the members wanted them particularly to do anything, always assumed a *non possumus* position; and sheltered themselves behind the opinion of counsel. If their conversion to the views of the members became a genuine one, they would very soon find a way out of the condition of impossibility. [Cheers.] He asked permission to withdraw the third part of his resolution rather because it involved simply a recurrence of that difficulty. He hoped they would emphasise by a tolerably unanimous vote the fact that they objected to the principle of registration of midwives, and objected to the manufacture out of them of a new order of medical practitioners—[Applause]—and thereby confirm the decision of the Clifton meeting, and then those who were concerned in the matter would be completely satisfied. The arguments which had been advanced on the other side were arguments for the improvement of the present condition of affairs. He would not contravene them, because he agreed with the statement that an improvement was necessary. It was to the advantage of the public, and it would be to the advantage of the profession, that there should be an increase in the quality of the attendance in midwifery cases amongst the poor. But the question arose. Was the principle of registration of midwifery practitioners the right way to relieve the difficulty? He said under all circumstances No. They were told it was inevitable from the force of public opinion. Well, public opinion was lomented by a number of people who had not given any real study to the subject. From an outside point of view altogether he had arrived at the opinion that those who advocated the principle of registration had the right and proper policy in view, for the reason that if they went back in the history of medical legislation, everything had been in a forward and upward direction, but that could be regarded as nothing but a backward and downward direction. [Applause.] They had now a number of women properly entered and employed in the profession; that number was year by year increasing. The day was when the movement was an unpopular one, but now the presence of ladies among them showed that opinion on that particular was altered. [Applause.] These women would be handicapped in general practice, perhaps more even than the men, by the proposed new institution of midwives. There were hundreds and thousands of unqualified male assistants who would be glad to give themselves a position by registering themselves under the new Act. They could not have registration without responsibility nor responsibility without control, and how was that control to be carried into effect? If there was to be benefit in the matter of midwifery practice it was to be done in another way altogether, namely, by removing the stigma of pauperism where poor women had to be confined and had to apply for State-paid medical relief. [Applause.] He begged to move the first clause of the resolution which stood in his name.

THE PRESIDENT OF COUNCIL: Is this a rider, because it is expressing the same opinion?

Mr. TAIT: I will take it as a rider or whichever way you like.

Mr. CHAS. CAMPBELL agreed with Dr. Ward Cousins that the present condition of things with reference to midwifery practice was intolerable, but he thought it would be well if

every member would think for a moment what was the present condition of things which was intolerable. It was usually asserted that the condition was the continued existence of their old friend Sairey Gamp. If that were so it was a very remarkable circumstance. For twenty years the Obstetrical Society of London had been selling diplomas to women of three months' education. The condition of things which was intolerable was not the presence of the old Sairey but of the new Sairey. He had had experience of twenty-five years' practice, mostly in connection with the old Sairey, and he had seen nothing of the horrors which had been so frequently depicted as the result. [Hear, hear.] Lately he had been brought in contact with one or two of the superior class, armed with a diploma to be measured by the yard, signed with the names of eminent gynaecologists, with very large letters usually, and with a picture of very remarkable dimensions at the top, and that was the woman who made the present condition of things intolerable. [Hear, hear.] She was told by her learned and honourable instructors, "My dear Mary Jane, you are better than the ordinary practitioner; you have been taught—I have taught you." [Laughter and applause.] The admiration was reciprocal, and Mary Jane went about singing the praises of her teacher, and the teacher sang the praises of his pupil. It has been asserted in the report of the Council that the General Medical Council had put down their foot upon that. The General Medical Council did put their foot upon it in a very determined manner last November; they declared that the conduct of those gentlemen who issued the diplomas was infamous, but like a timid child who put his foot into the water, they had drawn it out. [Laughter.] He thought they had very materially increased the difficulties of the position by sanctioning a certificate in midwifery. What did a certificate in midwifery mean but a certificate in the science and art of midwifery? [No.] He sincerely trusted not, but there was the position. Bogus bank notes had been issued, and now the legalisation of that which was illegal was required.

Surgeon-Major INCE called upon the members to pause most seriously before committing themselves to the resolution proposed. What was the motive which was leading them to make that alteration? Was it really philanthropy? Was it really a feeling of regard for the poor mothers? [Long and continued cries of "Yes!"] There might be some spark of philanthropy in it, but it was most discreditable for that public meeting to pass a proposal of that kind, and ignore the existence of thousands of ordinary midwives. ["Vote, vote!"] They seemed very impatient to come to a wrong conclusion, and as he found his efforts to act the part of a midwife by delivering them from the prospective danger into which they seemed determined to rush were unavailing, he would withdraw from the case. [Laughter.]

Mr. VICTOR HOSWALY said he had no special competency to address the meeting on the subject of obstetrics or gynaecology, and he did not propose to occupy their time for a single moment or to question from any but the most special point of view of the Parliamentary Bills Committee. He noticed that the proposer and seconder of the amendment continually used the expression, "The registration of midwives." He ventured to protest against such language, because no registration of midwives was before the Association at all. The only thing that was before them was the registration of midwifery nurses. He was quite prepared to be corrected, and to hear the significations of dissent, meaning that what has been understood by the Parliamentary Bill's Committee to be a midwifery nurse was something more than a midwifery nurse. That being so, that was the matter for discussion, not the question as to whether they were going to perpetuate a set of practitioners who at present were in actual existence. If that question was raised, they at once split the profession and the Association. Moreover, they had actually on the paper for production before that great meeting another motion on that very subject, proposing not merely the registration of midwifery nurses, but the registration of other nurses. He ventured to say that their time had been to a certain degree wasted, for this reason: as a matter of fact, the Bill for the registration of midwifery nurses, which was drafted by a subcommittee, of which he had the fortune or

misfortune to be chairman, was published in the JOURNAL only the other day. It was sent, by reason of the exigencies of time, to the Branches only, and the Branches had not yet had the opportunity of expressing their opinion upon the subject at all. From the constitutional point of view, from the construction of the Association as a whole he did think it was a waste of time for the meeting to express its opinion on the subject before the Branches had done so. He was only referring to the constitution of the Association. According to that constitution everything had to be done by the Branches and then brought before the Council at the General Meeting. The discussion on the registration of midwifery nurses was in no wise affected by the amendment before the meeting.

THE PRESIDENT OF THE COUNCIL: It was not an amendment; it was a rider to the resolution.

Mr. VICTOR HOSWALY said the rider to the resolution had really no bearing upon the question before the Association. It was, as a matter of fact, a statement of opinion with which they would all agree. They all agreed that there should be no class of imperfectly trained practitioners existing. [Hear, hear.] That was a very different thing to the class of trained nurses. He rose for the simple point of putting the Committee, for which he was partly responsible, right before that great meeting. He believed that if the discussion proceeded on its present lines that Committee would be to a certain degree stultified in the actions which it had seen fit to lay before the Association.

Professor MURDOCH CAMERON said that for many years he had been engaged in the education of the despised midwife, and he had never used the term "my dear" to a single nurse yet. [Laughter and applause.] A large number of his students were ladies who had been engaged in hospital practice as trained nurses, surgical and medical, for many years before they came to be trained as midwifery nurses, and he thought in training such women and putting them in a position to attend poor women they were doing a greater kindness than going on on the lines that were at present adopting in allowing them to call upon Sairey Gamp. It was a matter of pounds, shillings, and pence. [No, no, and Yes, yes.] He knew it was a fact that when a poor woman was about to be confined and went to a doctor he demanded his fee, and would not go until he obtained his money. [Denials.] He knew well enough in cities—he did not speak about the country practitioner—that there were thousands of poor women who were not able to pay beyond three, four, or five shillings to a midwife for a confinement. Where were the medical men that would go to a case on such terms? [I go for nothing.] He begged to move as an amendment:

That legislation on the subject of the registration and training of midwives should receive the support of the British Medical Association.

Dr. HAYWARD said that for the last fifteen years he had been one of that army of general practitioners who in districts more or less remote had attended to all the emergencies that could fall to a professional man. In the district in which he practised, at least three-fourths of the midwifery cases were attended by ignorant, untrained women, and he had found, unfortunately, repeatedly that very disastrous consequences occurred both to mothers and to children. There was a most appalling ignorance of the danger of hemorrhage, and a lack of even ordinary cleanliness. He need not say that the mortality in the district in which he practised was enormous. He appealed to them as members of a profession which was usually considered to be great and noble not to be guided by too narrow and selfish motives in their views on the matter, and remember that this great question was not to be decided even by that meeting; and even if the voice of the medical profession was unanimous, that would not settle the question. The matter was to be settled by the voice of Parliament, and if they as a profession simply put themselves to obstruct and hinder, the matter would be decided without them. He had great pleasure in seconding the amendment.

Sir WALTER FOSTER said that had not the last speaker tried to throw dust in the eyes of some of the least instructed among them by saying that the question would be settled by Parliament, he would not have spoken. Parliament settled those questions according to the will of the people of the country. [Applause.] Surely Parliament in this matter was

especially in need of guidance—[hear, hear]—and he felt certain they would receive it from that meeting. They as an association of medical men were in no sense opposed to the improvement of the condition of these women who attended on their sisters; they wanted them improved in education and in training, and above all they wanted them improved in the various little matters of cleanliness that went so much into questions of midwifery success. When anybody got up and said they were obstructing anything of that kind it was a false statement which reflected on the profession, and he felt personally upon himself, because he had had to bear some of the brunt of the battle. When the General Medical Council had this matter in consideration—and their experience ought to be a fruitful source of information to them—there was a Bill brought forward for the registration of midwives. He, as one of their direct representatives, pointed out the danger of registering midwives, and pleaded for the registration of midwifery nurses, because all that was wanted in the improved training, the improved education, and the improved knowledge of parturient cases could be obtained through the improved training of midwifery nurses, but if they forced upon the public, through any resolution of the Association or any Act of Parliament—which God forbid in the interests of the women—the class of persons who were only trained for three or four months at a midwifery hospital, and then sent out with legal sanction to become practitioners, there would be disasters infinitely worse than before. When any one asked them as a body of intelligent men to vote for a system of registering midwives, he asked them to break down some of the best work that had been done in the profession for the last fifty years—[applause]—because it opened the door at once to a lower grade of medical practitioners, limited at first to midwifery, but leading up to a further encroachment on the medical domain by suggesting licensing of other persons for the other branches of medicine and surgery. When the Bill for the registration of midwives came before the General Medical Council, it defined the midwife as a person who could only attend cases of natural labour, and when it went through Committee, and was reported, all definition and limitation of function was gone. Thus they saw the danger which lurked in Bills like those. If they put on the face of these Bills that they were to be for the registration of midwifery nurses, they then took the first step for the organisation of the nursing profession, which would become like the organisation of the medical profession, and would give to all these women so registered a proper training before they were entered on the register, and enabled them to give to their sisters in trouble adequate help, and at the same time would not encroach on the Medical Act of 1858 or create a danger to the whole medical profession. [Applause.] He therefore hoped that the gentlemen present—and the ladies, too, who were members of the profession—would join with him in heartily supporting the motion. [Applause.]

Dr. CULLINGWORTH said he thought it would be an act of cowardice if those gentlemen who held the opinion that the registration of midwives was desirable did not stand up and say so. The question was one that he, in common with most of his colleagues, the obstetric physicians of the hospitals of London, had had occasion to think out and to decide upon, and they had certainly come to the conclusion that the registration of midwives was a crying necessity. The statement that a new order of practitioners would be established by the registration of midwives was a statement that was not borne out by the facts. At the present time there already existed a very large number of midwives in this country, and all that they desired was that those midwives practising among the poor people who insisted upon having a woman and not a man should be so far competent at any rate as to know the elements of their work, and to know when to send for medical assistance. That was all that they wanted. It was no doubt very desirable in the abstract that a midwife should receive a long training, and that she should know something of medicine and surgery if she practised midwifery—[No, no], but it was a question of money. These women could not afford a long training, and was it not better that they should have a little training rather than none at all? [No, no.] He very heartily supported Professor Cameron's amendment, and he should be exceedingly sorry if that meeting, representing

a great association of medical men, the traditions of whose profession were all on the side of unselfishness, a profession that gloried in its unselfishness, should pass a vote which would in any way soil those traditions.

Dr. WOODCOCK said he would not have risen to speak if Dr. Cullingworth had not indicated in the closing remarks of his speech that they on the side opposed to him were pursuing a selfish and unpatriotic course. [Hear, hear.] The whole cause of the division that existed in the profession was that a few gentlemen had arrogated to themselves the right to speak in the name of the profession and argued that all the dignity, the self-sacrifice, the wisdom, and the patriotism had been crystallised in the Midwives Institute. [Applause.] He entirely protested against that statement. They were not there to do anything which was inimical to the dignity of the profession, or in any way to soil its traditions, and nobody could say that the general practitioner of this country were not an unselfish class of men. He wished to know whether they were to be lectured by a supercilious class of specialists. [Applause.] He wished to know whether it was to be constantly indicated, as he had found it had been in coming in contact with members of the House of Lords and of the House of Commons, that the whole of the benevolent schemes which were proposed by those philanthropic people were proposed, because they were a selfish class of people, and because they were the residuum of the profession. He (Dr. Woodcock) had been engaged with Mr. Victor Horsley and other members of the Parliamentary Bills Committee in endeavouring to come to a solution of the question which should do no injustice to the profession or to the community. The existing midwife was simply a woman dressed in a little brief authority, in addition to which she was clothed with the praises of the teachers at whose feet she knelt; it was a sort of mutual admiration society. [Laughter.] Those women who were being certified were an ignorant class of people, and yet it was being sought to get them hall-marked by the Government as being solid metal when they were only spurious. He admitted that something was needed to be done, and that nothing could be worse than the existing state of things, but he suggested that the right direction in which to bring about a remedy was that indicated by Mr. Victor Horsley. There was all the difference in the world between a woman who was designated by a title which meant an individual and responsible practitioner and a woman who received the name of "nurse," which indicated that she should be acting under some sort of control. [Applause.] He hoped that the Association would come to something like a unanimous conclusion in the matter, because if they did not he felt sure the Legislature would take the matter in their own hands. He did protest strongly against gentlemen who represented perhaps four or five hundred of a special class standing by and talking as if they alone were concerned for the public benefit and as if all the other members of the profession were a lot of vulgar, selfish people who might be ignored in a matter which really concerned them infinitely more than it did the special class he had referred to. [Applause.]

Mr. WHEELHOUSE said that as one of the direct representatives of the Association on the General Medical Council and as one who had closely followed the question, he would like to mention the course of action which he had pursued. He was one of those who had settled it in his mind that to register any number of women upon a three months' education in one branch of the profession alone, and then to hall-mark them as midwifery practitioners would mean the ruin of the younger members of the profession, would be placing the women themselves in an utterly false position, and would be shutting the gate by which young men entered the profession and by which young practitioners hoped in the first instance to live. [Applause.] They were not asking either the Government or anybody else to sanction the right of any person to practise midwifery. What they were asking for was that they should bring nurses trained in a third branch of the profession in exactly the same manner as they had trained nurses in the other two branches. At the present time there were also medical nurses, but they were not called nurse physicians. Why, then, should they not have obstetrical nurses or midwifery nurses, and why in their case alone should they be stamped as practi-

tioners, and, as would have been done under the late proposed Bill, have them entirely removed from the authority of any medical man or anybody else? [Applause.] He defied any gentleman present to state what was a natural labour until the labour was over. Cases might appear all right for some time, but there were circumstances which might spring up which would render the case one of infinite danger, and which an ignorant woman would not be able to perceive. [Hear, hear.] He asked them therefore to open their eyes to their own interests, to the interests of their sons who were being received in the profession, and to the interests of the profession itself, and, whilst they admitted that the midwifery nurses should receive as full an education as possible, not to stamp them as midwifery practitioners independent of the medical profession, and as capable of managing that of which they knew just what three months' education had taught them.

Mrs. SCHARLEIGH said she had been asked to speak upon the question because she had seen a great deal of midwifery practice both in England and in India. In India they had very carefully trained women sent out as midwives, who worked under the doctors, but it not infrequently happened that the nurses had to go far up country, where there were no medical practitioners either male or female to whom they could apply. It was a most undesirable state of things, but it was a fact. She was told that sometimes it was impossible even in England to get a qualified practitioner to go to every case of midwifery that occurred. Nobody regretted more than she did that there should be anything but a thoroughly qualified set of practitioners to attend all cases of midwifery, but it would be admitted that the women who had received a proper training in midwifery were more likely to recognise beforehand the difficulties, the dangers, and the accidents that were constantly occurring in midwifery practice. It would also be admitted that qualified practitioners were more likely to be called upon by a midwifery nurse or a midwife, who could recognise danger, than by one of those ignorant women who let things drift to such an extent that no human agency could avail to save the patient. [No, no.] On behalf of the lady practitioners she should like to say that they were not prepared to take the minimum fee of 10s. 6d. or 15s. which had been referred to, whilst they would all deprecate the formation of an independent class of practitioners; and whilst they would shudder to see the difficulties and dangers of midwifery in the hands of incompetent persons, they would like to see a band of women who could recognise the danger, and know when to send for a medical practitioner.

Professor Murdoch Cameron's amendment, as follows: That legislation on the subject of registration and training of midwives should receive the support of the British Medical Association, was then put to the meeting, and declared by the President of Council to be lost by a large majority.

Dr. LEITH NAPIER rose to address the meeting, but was met with cries of "Vote, vote," and he was eventually ruled out of order by the President of Council.

Mr. Tait's rider, as follows:

That we, the members of the British Medical Association, while anxious to improve the training and supervision, and, if need be, to support, a practical scheme for the registration of medical, surgical, and midwifery nurses, emphatically condemn any proposal which has for its object the formation of a class of medical or surgical or midwifery practitioners other than those recognised under the Medical Act, 1858, as now existing.

was then put to the meeting, and declared by the President of Council to be carried by a large majority.

Dr. LEITH NAPIER said he wished to enter a personal protest against not being allowed to move his amendment.

Dr. ARTHUR WELSFORD, in moving the resolution standing in his name, said that they had been told that afternoon that the question of medical defence had been for twenty years before the British Medical Association, and he thought it was now about time that it was taken seriously into consideration. The Committee had reported on the matter, and they had stated that it was impossible to alter the Memorandum of Association. According to Clause 3 of the Memorandum the objects for which the Association was founded were stated to be two

in number: (1) For the promotion of medicine and allied sciences; and (2) for the maintenance of the honour and interests of the medical profession. His point was that the British Medical Association was intended to be not only a scientific society, but also a body to represent the medical profession, to maintain their honour, and to look after their interests, and to unite them into a compact whole. Clause 3 of the Memorandum provided by the holding of meetings, the reading of papers, etc., for the first object, and for the second object alone, leaving no provision for the second great object for which the Association was created. If, therefore, they were going to remedy that unfortunate oversight, which rendered the work of the Association practically of no avail, and which had practically made it a failure, they must consent to alter the Articles of Association so that both the income and the funds of the Association could be utilised for the purposes of medical defence. [Applause.] It had been stated that the alteration of the Memorandum of Association was a difficult matter, but he ventured to state with confidence that since the passing of the Companies Acts there was no real practical difficulty in the way. It would be seen from a perusal of the Companies Acts that they had only to be in agreement on the point, and they could then go before a judge and alter the Memorandum as far as it was desirable. With regard to the *non possumus* attitude which had always been adopted with regard to the question under discussion both the British Medical Association and the General Medical Council disowned all responsibility, and allowed evils to continue which, if they tried to, they could check. That cry of *non possumus* was always raised to every proposal and suggestion for the defence of the medical profession. In the report of the General Practitioners Committee *non possumus* was written in big letters, and it was a curious thing that the view of the Committee with regard to medical defence was an exact reflection of the view of the General Medical Council, for whilst both bodies considered that medical defence was a duty, neither of them considered itself able to undertake it. The British Medical Association asserted that the General Medical Council should undertake the duty, and *vice versa*. The action of those two bodies reminded him of the lines written about Lord Chatham and Sir Richard Strachan—

The Earl of Chatham with his sword drawn,
Stood waiting for Sir Richard Strachan;
Whilst Strachan, eager to be at work,
Stood waiting for the Earl of Chatham.

[Laughter and applause.] It was obvious to his mind, that the British Medical Association was the only body that could adequately undertake those duties. [Hear, hear.] Whilst they boasted of the large membership very little more than half belonged to the Branches, and the other half could not really be reckoned as members but only as subscribers to the JOURNAL. Even very few of that half attended the Branch meetings. His experience was that Branch meetings all over the country were very inadequately attended, (and no interest whatever was taken in the business part of the meetings. A large section of the members were very dissatisfied with that state of things and the more active members wished to see the Association take an active place in the medical world. He wished to state that in answer to private requests 19 of the 40 Branches had passed the resolution he had proposed, and of the others not one had voted against it. He believed that only one Branch had found itself unequal to vote on the subject. It was not for them to discuss how that medical defence was to be undertaken, but whether it should be undertaken by the whole Association, and whether the second great object for which the Association was founded was to be made a real object of the Association's activity. They need not trouble at all about the financial question. Let the Council come forward with a practical working scheme of defence, and the members would not grudge to bear their share of the expense. [Applause.] He trusted that the resolution he had proposed would be unanimously passed. He believed that it contained the germ of a great reform that would be of inestimable value, and he hoped that the members present would not be dismayed by difficulties which could be overcome, and would not be discouraged by the *non possumus* attitude which had been taken by some of the speakers, especially by the Council, that afternoon. No

difficulties had ever been met by sitting in the mud, and if they were going to wait until the *dans ac machind* was to extricate them, they would remain in the mud for ever. [Applause.] He begged to propose the resolution as follows:

That it is in the interest of the public and of the medical profession that the Council of the British Medical Association should take power and authority to protect both the individual and collective interests of the medical profession, and that the Council be requested to take such steps as may be necessary to enable it to actively undertake these duties, and to devote a portion of the income and funds of the Association for these purposes.

Mr. G. F. BULLAN said there was very little to add to the statement which had just been made. Several of the speakers had referred to the great difficulties in the way, but he thought they had to consider whether if they did nothing at all they would avoid difficulties, whether there were no difficulties surrounding them at the present moment. The object for which the profession existed—the cure of disease—could not be obtained solely by endowing research, by educating students highly and turning them out to waste their talent in treating medical aid association patients whom they had not time to examine. It was of the greatest public and professional importance that the profession should be recruited from men of ability and honour. The treatment of the poorer classes, if things went on as they were, would fall into the hands of an inferior class of men, and it was therefore very important that some steps should be taken to improve the present state of affairs, and to put down quackery not only outside the profession but inside. It was said that the General Medical Council ought to do that, but the General Medical Council were simply a judicial body, and had no power to act as prosecutors. The profession had no prosecutor, and he thought it was a duty that might very well be undertaken by the Association. He had very great pleasure in seconding the motion.

Dr. DORRIS said he desired to support the resolution from an aspect that had not so far been accentuated. He wished to point out the great power it would give to the British Medical Association to deal with the subject of proper remuneration for the services of medical men. [Applause.] It would give them power to deal with the medical aid associations, it would give them power to deal with the so-called medical charities, which were a mere prostitution of the term, and it would give them power to deal with those trading societies that treated their medical officers in a manner that was only equalled in the sweating dens of the East End of London. [Applause.] The working classes had organised themselves, and combined to get higher wages and shorter hours, but they had also combined to pay their doctors less and give them longer hours. [Applause.] On behalf of the medical men themselves he hoped the Council would give the subject their attention, not only for the honour of the profession, but in the interests of the poorer working classes also. He asked the meeting to pass the motion, and if the Association would not stir a finger to help the most deserving class of practitioners, those who laboured among the working classes, it was nothing short of a disgrace. He knew the Council had thrown it out, but he asked the members not to take any notice of that. The Council was their House of Lords—[laughter]—but if the members showed their wishes he was quite sure the Council would be only too ready to carry them out.

Mr. GEORGE BROWN said that as one of those who had wrestled with the Council for twenty years upon the subject, he would like to say that though he had had many a severe tussle with the Council, and had been worsted on many occasions, he could still come up smiling and ask the members to support him on the question. He did so with the more confidence because they had got an admission that day from the President of Council that they were seriously considering the matter. Having succeeded after twenty years in getting to the stage of "considering," he hoped that it only required a little more pushing to get the Council to act. If the resolution was passed unanimously he thought the Council would act, and if they made up their minds to act the difficulties would vanish like mist in thin air. As to the legal difficulties, if they went before the legal profession and asked them to remove these difficulties it would be done. [Applause.] There was no difficulty whatever in altering the Articles of

Association. With regard to the expense, a very great difficulty was raised—that it would be necessary to defend the profession all over the world. He thought there was a way out of that difficulty. If the Council would take to themselves the power to act in the matter, all they would have to do to prevent being called upon to defend medical men in China, India, Japan, New Zealand, etc., would be to delegate the defence work to the Branches. By doing that the Council would give it into the hands of men who were acquainted with the local requirements. In that way it would not be compulsory for any Branch that did not wish to take on the work of medical defence to expend the money. In large towns, such as Manchester, Birmingham, Liverpool, etc., and especially in colliery districts, the question was really of a serious character. The interests of the profession were very seriously damaged, but it was the interests of the public which were being injured and valuable lives sacrificed through no adequate measures being taken to prevent the practice of inferior practitioners in the poorer districts.

Dr. J. MCCARTHY said that the matter was one in which he had been interested for some years, and one on which the Branch over which he presided had passed a resolution in much the same terms as that which they were now asked to pass. What was the reason which had led up to such a resolution as was now being asked for? It was not that the members were weary of well doing, it was not from any mercenary point of view—the profession showed its charity in the amount of work it did through hospitals, dispensaries, and the Poor Law—but it had been brought about by the changing of their surroundings. The medical aid associations had been referred to; and there was another point he would call their attention to, and that was that the chemists, who had had an inch given them, had taken an ell, and lately were getting more impudent and taking to visiting. The profession was harmed every day and dishonoured by having to come into contact with a large number of chemists that were doing rattling practices. As an illustration he might mention what had occurred to him within the last three weeks. A patient had a rigor, and sent to a chemist, and the chemist, without seeing the patient, supplied medicine and left the patient suffering from pneumonia unattended by a medical practitioner until the fourth day. The best time for treatment had then gone by, and he (Dr. McCarthy) had to fill in the certificate. That was more or less covering against his will, the chemist in his practice. With regard to the report, the members would express great gratification that the Council had endorsed their complaints. They had admitted that they had not exaggerated the evils, and they said the remedy was not easy. That the members admitted, but that was the greater reason why they should come to the most magnificent and largest organisation in the medical profession to get the difficulty solved. The members also felt thankful for the sympathy which had been expressed towards them, but they did not see the relief—"Sympathy without relief is like mustard without beef." The Council had given them the mustard, and they asked for the beef. [Applause.]

Mr. BUTLIN said he was very loath to speak on the subject at all, but if no member of the Council were to speak, and especially if he as Treasurer were not to speak, on a matter which so much concerned the finances of the Association, naturally everybody would conclude there was nothing to be said on the other side. He had read an article by Dr. Welsford in the *Medical Magazine* some time ago, which he considered to be a very able article, drawing attention to what had been achieved for the legal profession by the Incorporated Law Society, and drawing a comparison between the Law Society and the Association, not very much to the credit of the Association, and since then further articles and letters had appeared. When he first read Dr. Welsford's article he was decidedly impressed by it, and it was not until he had looked very carefully into the question that he discovered what very great difficulties there were, and that a great deal more could be said for the Association than for the Incorporated Law Society. To begin with he would draw their attention to two very great differences between the legal profession and their own. In the first place there were practically no quacks in the legal profession and very little illegal practice; and in the second

place there was not the same tendency among lawyers to work on reduced fees. He had been told by a gentleman in the legal profession that they never reduced their fees and no complaint of the kind had ever been brought before the Incorporated Law Society. It must be remembered that the Incorporated Law Society was incorporated by Royal Charter, and it was to examine men for admission to the legal profession, that it kept the roll, and that it had to deal with offenders, and brought the greater offenders before the judges, when they were liable to be, and often were, struck off the rolls. The Association was a mere company incorporated under the Companies Acts. The Incorporated Law Society had some of the duties of the General Medical Council, and some of those such as were performed by the Royal College of Physicians and the Royal College of Surgeons. The British Medical Association was a body formed for certain purposes, and they fulfilled as many of those purposes as they could, and hoped to fulfil others of them better in the future. As to the funds of the two Associations, their own subscription was one guinea, and for it they gave an excellent journal which cost more than the subscription. The Incorporated Law Society charged £2 for London members and £1 for country members, very much larger than their own compared with the advantages that were received. The Incorporated Law Society valued its premises in Chancery Lane at £135,000, and the Association at the present time had something under £50,000, so that if they were to buy freehold premises and build such premises as the Law Society had, they would have to lay up another £50,000 or £60,000, or as it might be. The law expenses of the Incorporated Law Society were about £5,000 a year, and yet they had no quacks to deal with and no defence practically of their members, which was a very important point indeed. As to the objects which the members were asking the Council to deal with, the two great objects were the suppression of quackery and the defence of the members. Several of those who sat on the General Practitioners Committee were favourably inclined towards granting money for the defence of members, and were inclined to give money to certain of the societies which had been formed for that purpose, and were very disappointed to find that they could not deal with the funds in that way, that legally they had no right to do so. When they came to consider the matter a little more closely they found it would be a manifest injustice to the majority of the members of the profession if they granted the funds to the society which had for its duty only to protect the members. Some of the gentlemen who had spoken said it was for the Council to draw up a scheme, but the difficulty was to draw up any scheme which would be applicable to all the members of the British Medical Association in all parts of the world. What had been said by Mr. Brown was perfectly true, that if the Branches liked to take up the matter on their own account, and use their own organisation, they could do so with considerable effect, and he (Mr. Butlin) believed that was the proper way of meeting those questions of etiquette, of cutting down fees, and of the defence of members, or prosecution of quacks in different parts of the country. He believed that was the line which should be taken, but they would have to exercise those powers under a different name, as it was impossible to use the general funds of the Association for the purposes which had been put forward. [Applause.]

A MEMBER: Will the Council subsidise the Branches for such objects?

Mr. BUTLIN: No, they cannot do that.

A MEMBER: Will they get the powers?

Mr. BUTLIN: I do not think so. We cannot do it.

Mr. VICTOR HORSLEY said that what they had just heard had been interesting, but really hardly touched on the great questions at issue. Their great desire was to ask the Council to take it into consideration for the purposes of action. [Applause.]

Dr. SAUNDY said the Council were quite willing to do that. Mr. Horsley had simply asked them to consider it, and they were perfectly willing to do so.

Dr. MACKENZIE said he represented two counties, Devon and Somerset, and the question had been discussed in the Branch and a resolution similar to the present passed. The question was one of broad principle—whether the Associa-

tion was to be carried on as it had been with one object, or whether it was to be generally useful. The practitioners in the country were apt to ask, What was the good of joining the British Medical Association? Only one-third of the practitioners in Devon and Somerset were members of the Association, because they felt the Association gave them nothing but a JOURNAL for their money. They wanted the Association to do much more, to mother them in every respect and to advance the profession in every right way. [Applause.] Were the Branches going to govern the Council, or the Council the Branches? The general practitioners of the country were feeling very warm on the subject. They were perfectly ready to pay an extra guinea.

Dr. HORSLEY said he came from "gallant little Wales," and as the President of the Council referred to the manner in which those resolutions had been passed at some of the Branches, he should like to deny that that was the way in his Branch. The matter was brought before not only the annual meeting, but was also discussed at other meetings, and the members were unanimous on both occasions. The question was, if the Council would not take up the question, whether the members must not take it up for themselves. [Applause.] It was a very simple affair, and if the Council had not men able and willing enough to find a solution of the difficulty, they must send men down who were willing and who were able. The question of altering the Articles of Association was a simple affair, and did not take long. In a leading article in the JOURNAL of May 5th of last year, the Editor had said that if the question was to be taken up, the members must show by their expression of feeling at the Branches they wanted it taken up. They must bring those resolutions up to the general meeting, and the general meeting would then say that the question must be taken up. [Applause.]

Dr. RANTON said that Mr. Hart stated in 1887, referring to the paying of members of Council, that they should do their best to provide the funds of the Association, so that they might be taken for medical defence purposes.

Dr. WELSFORD's resolution was then put, and carried by a very large majority.

Dr. BEDFORD FENWICK then moved:

That in the opinion of this meeting it is expedient that an Act of Parliament should, as soon as possible, be passed providing for the registration and education of medical, surgical, and obstetric nurses; and the Council of this Association are therefore requested to consider this matter, and to take such measures as may seem to them advisable to obtain such legislation.

He said he proposed it on the broad ground that it was important for the Association to show that it was not biased by any of the sordid and unworthy motives that had been ascribed to those who opposed the registration of midwives.

Mr. JOHN BROWN seconded the resolution, which was carried with only one dissentient.

The motion for the adoption of the General Practitioners Report, with the addition of the three riders, was then put, and unanimously carried.

The meeting then adjourned.

ADJOURNED GENERAL MEETING.

THE adjourned General Meeting was held on Tuesday evening at the Imperial Institute, Kensington, and took the form of a *soirée* given by the members of the Metropolitan Counties Branch. It was attended by a very large number of members of the Association, accompanied by ladies. Previous to the general meeting, the members were received in the Entrance Hall by the President and officers of the Metropolitan Counties Branch.

President's Address.—The President's address was delivered in the Large Hall of the Institute, which, at the commencement of the proceedings, was densely crowded. [The address is published at p. 261.]

Professor CLIFFORD ALLBUTT said a great honour and privilege had fallen to his lot that evening, namely, to try as their spokesman so far as he could in his imperfect way to express their gratitude and thanks to the President for the remarkable and admirable address to which they had listened. That vast hall was built apparently for any other purpose than for acoustic properties, but those who had been upon the front benches and within a short distance of the President would,

he was sure, bear him out in saying that the address was one which appealed most forcibly to their understanding, and was marked by a noble ethical tone. [Applause.] The whole of the address was also pervaded with the literary charm and amenity which they expected from one so well known to the profession as Sir John Russell Reynolds. Those who had heard the address would agree in saying that his (Professor Albutt's) words quite imperfectly expressed the feelings which the delivery of the extraordinary address had evoked. The customs of society had impressed upon individuals, to some extent, a degree of reticence in the presence of those of whom they would speak with more cordiality than perhaps the recipients of their eulogy would quite wish them to do on a public occasion of that kind. He might in what he was saying be carried away by the enthusiasm of so great a meeting, and also by the remembrances of thirty years' friendship with their President, to express even in stronger language the cordial feelings which were in his mind at that moment in respect both to him and to his presidency, and to the address which he ventured to think had struck a keynote, which, at the commencement of the great meeting, could not be without its influence upon every section and every part of it. He earnestly hoped that the spirit of the address, not merely its intellectual power, but also its great ethical elevation, might be carried through all the sections, and felt even beyond the present occasion and beyond even the present meeting of the Association. [Applause.] They knew that their President not merely graced the chair at that great meeting when he had the enthusiasm of the whole of the profession at his back, but that he in another place had filled a chair which also had its great responsibilities, and it might safely be said that they would judge from that occasion as in that other place that he had not filled these offices without both strengthening and adorning them. [Applause.] It was not given to all present to know how much the President had done by his urbanity, his courtesy, and business-like habits to get that vast meeting into the order and perfection it had attained; but they had had an opportunity of hearing from what kind of mind an address of that kind must come—from a mind of cultivation and of singular elevation and of great intellectual energy, which must set an example to their great profession, and which he was sure the President would allow him to say was characteristic not simply of himself, but of his great predecessors. [Cheers.] He asked them

To return the warm thanks of the Association to Sir Russell Reynolds, Bart., M.D., F.R.S., for his able and interesting address.

[Cheers.]

Professor GAIRDNER said he had the very easy duty of seconding the motion so admirably proposed by Professor Clifford Albutt. He would not attempt to go over the ground again, or to expend language upon what was not necessary—namely, the eulogising of his old friend Sir Russell Reynolds. He wished to single out one point in the admirable address to which they had listened, because it permitted him to illustrate it by an anecdote. He referred to the allusion to the great advance that had been made of recent years and to the illustration given of that remarkable disease myxodema and the application of the thyroid treatment. It was now about thirty years since a lady had consulted him in Glasgow whose case puzzled him extremely. He was not ashamed to say that he did not know much about myxodema at that time, but had he known what he knew a few years later it was a case that would have just explained itself. He lost sight of his patient, but some years afterwards he received a letter from a gentleman now on the platform introducing a patient who turned out to be his friend the lady of thirty years ago. When she came he questioned her as to what had happened in the long interval, and it appeared that she had been to almost every Continental spa and every place where medical skill was supposed to be at the highest pitch, but had never got the slightest enlightenment as to the name and nature of her disease until one day, sitting at a *table d'hôte*, the lady who was sitting opposite to her said: "Madam, I think you have got the same disease that I have got, and if I were you I should go to London and consult my physician." She did so, and the result was she was again sent to him (Dr. Gairdner) without the slightest idea that he knew anything about her previously. That showed how the diagnosis of the disease was the first step towards any scientific

cure. At the time, however, nothing was known about thyroid extract, which was a new development of the most astonishing kind. The development had been made because, in the first instance, some cases where the thyroid gland had been excised for goitre, exhibited ultimately symptoms something like myxodema, and in the second place it was found that the excision of the thyroid gland in monkeys caused in them symptoms something like myxodema, from which it got to be inferred that the administration of the juice of the thyroid gland would do something towards the cure. He thought that Sir Russell Reynolds certainly did not exaggerate in the remarks that he made upon the enormous progress of medicine.

The resolution was carried by acclamation.

At the conclusion of the address the company adjourned to the gardens, which were brilliantly illuminated, and presented a charming spectacle. Here also the Strauss Orchestra, conducted by Herr Edouard Strauss, played delightful waltz music. At an earlier period in the evening the band of the 4th Middlesex Rifle Volunteers gave a selection of music. Ample accommodation for refreshments was provided, and promenading to the delicious strains of the waltz music was kept up till a late hour. Altogether the function was most brilliant and successful.

SECOND GENERAL MEETING OF MEMBERS—WEDNESDAY, AUGUST 30TH.

The PRESIDENT (Sir J. RUSSELL REYNOLDS) in the Chair.

The second general meeting of the Association was held on Wednesday afternoon.

Place of Meeting for 1896.—At the request of the PRESIDENT, Dr. WARD COUSINS (President of the Council) announced the following resolution which had been passed by the Council at their morning meeting:

That it be recommended to the general meeting of to-day that the Council be empowered to arrange a place for the annual meeting of 1896; and, further, the appointment of a President elect.

Dr. Cousins said that it sometimes happened that they had not a place of meeting, and they found that very many localities were unwilling to follow London. He hoped, however, that before the next quarterly meeting of the Council they would have decided upon a place where the Association might meet next year. He trusted that the announcement he had made would cause the members no uneasiness, because they might rest assured that the gap would be filled up. He wished further to announce that the new Council of 1895-96 had entered upon their duties that morning, and that the following changes had taken place: Barbadoes Branch, Surgeon-Major Thomson; British Columbia, Mr. E. Hassell; Gibraltar, Dr. Wm. Turner; Grahamstown, Dr. E. Atherstone; Halifax and Nova Scotia, Dr. D. A. Campbell; Lancashire and Cheshire, Dr. S. Woodcock; Metropolitan Counties, Dr. J. W. J. Oswald and Mr. Henry Power, and in the South Western Branch, Mr. L. Mackenzie.

Address in Medicine.—The President then called upon Sir William Broadbent to deliver his address, which will be found on page 266.

Dr. Pavy said he felt it a pleasurable privilege to have been called upon to propose the resolution which he was about to put before the meeting. It was a privilege which had doubtless been accorded to him from the position which he occupied in relation to the Section of Medicine. The deliverer of the address to which they had just listened with the greatest pleasure spoke at the beginning about the position of the words "Art" and "Science" in relation to Medicine. There was no doubt that Science should precede Art, that Science should stand as the foundation and as the basis of Art, but as the deliverer of the address correctly said, here Art had preceded Science. In the dark ages of the past it was simply Art which constituted the guide, but with the advance of knowledge they were patting aside Art and finding that they could bring to bear Science as constituting the basis of their procedure. By Science they were put in possession of the knowledge of the whole procedure of the thing—the processes that were taking place; and with a knowledge of those processes they could so command the supply of conditions as to bring about the results which they desired to be

attained. It was that which gave the power to the human mind of accomplishing what they found to be attainable. No doubt they all sympathized with the deliverer of the address in the difficulty in which he was placed under in selecting a theme for his address, but he was sure that they must all admit that the deliverer of the address that day had been most wise and most happy in the subject which he had selected. [Applause.] They must all admit that they had listened to a learned address, an address which could only come from a mind of a high order—[applause]—and when he (Dr. Pavy) said that the address to which they had listened was worthy of the man who had delivered it, he considered it was not necessary to say anything more than simply to propose:

That the cordial thanks of the Association be given to Sir William Broadbent, Bart., M.D., F.R.C.P., for his admirable address in medicine. [Applause.]

Professor J. O'Connell said it was a great pleasure and satisfaction to him to have the opportunity of seconding the vote of thanks to Sir William Broadbent. He had been a long and attentive student of Sir William Broadbent's contributions to literature, and, like every one who had studied those contributions, he was quite prepared to find that the address bore the stamp of originality, of great precision of thought, and of great lucidity of expression, and he thought it was a wise thing now and again to go back on the past and to consider what manner of men their predecessors were—how the student stood in relation to the great body of men around them, how the student stood in relation to the age in which they lived. There was one thing that a study of literature impressed on one, and that was that the great leaders of medical thought were not merely great physicians or great surgeons, but they were great men. [Applause.] They were men who held a high place in comparison with those who surrounded them. It would be quite easy to give a number of examples from Hippocrates downwards bearing on that, but it was unnecessary for him to add anything to the luminous sketch that Sir William Broadbent had drawn. He might say, however, that the very eminence of their leaders in the past was a source of danger, that they stood out so prominently that their successors were afraid to differ from them. One point that the study of the history of medicine brought clearly forward was that the reproach often addressed to their profession of not being sufficiently progressive, and of being non-receptive of new ideas, was most singularly ill-founded. A study of the history of medicine led rather to the opposite conclusion—that they were too ready to take up new ideas, that whenever a chemical discovery was made, or a mechanical discovery was brought forward, it was eagerly seized upon by the medical profession, so that it was at one time almost thought that the whole of the vital processes were to be settled by the reactions in a test tube, and that the whole animal economy was to be resolved into a bundle of levers, or something of that kind. The fact was they were almost too ready to take up these new ideas. They had got completely clear of any undue respect for authority: they were inclined to criticize everything on its own merits, and would not follow any leader however eminent. Even the germ theory, which had done so much to revolutionize medicine, was being scrutinized with regard to its minutest applications with a care which was not by any means excessive, but was certainly very considerable. He had very great pleasure in seconding the vote of thanks.

The President said it would give him very great pleasure if he thought there was the smallest necessity to add some acknowledgment to the remarks that had been made in proposing this vote of thanks for the admirable, interesting, learned, and most instructive address which had been delivered. He would not, however, occupy their time by so doing, as it had been so exceedingly well done by Dr. Pavy and Professor Cunningham.

The resolution was carried by acclamation.

Sir William Broadbent said he would not further occupy the time of the meeting by any elaborate expression of thanks. To attempt to reply in fitting terms to the eulogies and encomiums that had been passed upon him would exceed his utmost endeavour. He could only thank his audience for the great patience and kindness with which they had listened to his address.

Greetings from Canada.—Professor GRIMM (Toronto) said that, as an old member of the Medical Council of the Province of Ontario, he had been deputed by that body in session in June last to convey to the British Medical Association its cordial greetings. Perhaps it might be thought that the Association was too vast and successful to require any greetings from any source whatsoever, and that their time was too limited to be troubled with greetings, come from whence they might; but what could be more natural than that the Medical Council in Canada, when it had the opportunity, should send the best of kind wishes to the British Medical Association? No body in Canada was more loyal to this country or the British medical profession, of which they considered themselves a part, than the medical men, all of whom took a most lively in the British Medical Association.

The President said he was sure the Association was exceedingly obliged for the kind message they had received from Toronto.

Parliamentary Bills Committee.—Mr. VICTOR HORSLEY said he felt it was a great honour that the motion for the adoption of the report of the Parliamentary Bills Committee had been placed in his hands. He was also aware that it was unfortunately owing to the fact that the Chairman was unable to be present. He would endeavour to explain so far as he could the lines on which the work that had been done by the Parliamentary Bills Committee during the last year had been carried out. Their work had been chiefly directed to the point which was mentioned yesterday, namely, the amendment of the Medical Acts, and also the question of the registration of so-called midwives. Upon the latter point they would hardly expect him to say anything. He explained yesterday that the Parliamentary Bills Committee had referred the matter to a subcommittee, and in accordance with custom that subcommittee had duly reported, and had circulated its report to the Branches for their opinion, but sufficient time had not elapsed within which those Branches could forward their opinions to the Council. That was the constitutional method which he had mentioned yesterday and to which exception was taken. He would be very happy, if that exception were renewed, to justify what he had said. The amendment of the Medical Acts was surely the largest question that the Parliamentary Bills Committee could possibly deal with. On all sides they had heard that it was too complex a question for that Committee. He thought himself that after all that was only another aspect of their old friend the *non possumus* argument. He had the honour of bringing before the Metropolitan Counties Branch a scheme for the amendment of the Medical Acts, which was, after many modifications, adopted by that Branch and forwarded to the Parliamentary Bills Committee. That Committee, however, at that time did not approve of anything more than a Bill involving amendments to the penal clauses of the Acts, and that was the position taken by the Association up till the commencement of the spring of the present year. When, however, the Bill which had been drafted by Mr. Muir Mackenzie and Mr. Costelloe, with the assistance of Mr. Upton, had been circulated in the proper form, namely, to the Branches, they very soon had the constitutional opinion of the Branches expressed, and that was to the same effect as the opinion already given by the Metropolitan Counties Branch, that that Bill was far too narrow in its application, and that what was wanted was a Bill which would deal not merely with the penal clauses but with the far more important professional question—the consideration of the construction and the procedure of the General Medical Council. Those who had some knowledge of the working of medical defence and of endeavouring to get the General Medical Council to administer the Act of 1858 in accordance with what they believed to be the literal as well as the spiritual meaning of the Act, were aware, that without the alteration of at least the method of procedure of the General Medical Council they could not get very much further, and at the same time they were aware that the profession was powerless without amendment of the Medical Act. The Parliamentary Bills Committee referred the question, with the opinion of the Branches upon the draft Bill, to the subcommittee, the appointment of which was already stated in the report of the Council. That subcommittee had

only had a few months to commence its work. At its first meeting it had placed before it by order of the Chairman the midwives question, and they found that the whole time would be occupied in dealing with that question; therefore, he had nothing to present to them as work done upon the great question of Medical Acts amendment. The subcommittee asked to be reappointed in order that it might deal with the subject, and it hoped that it would be able to present a report at the commencement of the following year. Any criticisms or opinions upon the question of amendment to the Medical Act should be forwarded to the Parliamentary Bills Committee or to the subcommittee for their guidance.

Dr. WOODCOCK, in seconding the motion, said he thought the Parliamentary Bills Committee had been more than ordinarily active during the past year; at any rate, it had necessitated a great many journeys from Manchester to London on his part. He had found it most agreeable to work with his colleagues, and he hoped the Parliamentary Bills Committee would justify the confidence that had been placed in them by the Association.

Dr. LOVELL DRAGE said he rose to move as a rider to the report the resolution of which he had given notice, which really was a corollary to the motion passed at the last meeting, and which was adverse to the registration of midwives. It had been supposed that those who opposed the registration of midwives had no alternative policy; but they had, on the contrary, a very decided alternative policy, which was first to get the alterations which were necessary passed in the Poor Law. He was glad to hear that method of procedure was receiving attention, and that Dr. Campbell had called attention to it at the last meeting. Anybody who had practical knowledge of the working of the Poor Law must be aware of the fact that it required only a very small alteration in the Poor Law to provide very considerable relief to the lying-in women of the country. What he asked the Association to do was to pass a resolution not dealing with that part of the policy, but with the part which related to the improvement of the training of medical students in midwifery. He thought the resolution he was about to move would appeal to all and would be passed unanimously. The proposers of the registration of midwives had always put it forward that it was puerperal fever which was carried about by ignorant women. If, however, they would take the trouble to look over the reports of the medical officers of health they would find that it was not puerperal fever which was in greatest excess amongst puerperal deaths but that it was accidents of childbirth. If they took Salford, which had one of the highest death-rates of the thirty-three great towns, it would be found that while there were only 11 deaths from puerperal fever during the past year there were no fewer than 30 from accidents of childbirth. If they took Derby, which had a very small death rate, it would be found that while there were only 3 deaths from puerperal fever there were no fewer than 8 from accidents of childbirth. He thought that facts such as these tended to show that at all events anybody should not be allowed to practise midwifery as a doctor who had not attended a very considerable number of labours under proper supervision. He begged to move:

That we view with deep concern and regret the recommendation of the General Medical Council to the medical examining bodies that they should admit students to their final examination who present a certificate stating that they have "conducted personally" only three, and "been present at" only nine confinements; and as the General Medical Council has refused on November, 1894, to alter this recommendation, we instruct our Council to petition the General Medical Council to recommend that no student be admitted to his final medical examination until he presents a certificate showing that he has personally conducted at least thirty confinements under the direct supervision of a registered medical practitioner. We also instruct the Council to take immediate steps to have Section 20 of the Metropolitan Poor Act, 1867, repealed, which prevents workhouse infirmaries from being used for the clinical instruction of medical students in practical midwifery while pupil midwives are now admitted; and also to petition the committees, medical staffs, and, if need be, the subscribers to the City of London Lying-in, the British Lying-in, and the Clapham Maternity to withdraw their rule which excludes male medical students from clinical instruction at these hospitals, seeing that these are now used by pupil midwives.

Dr. KENTON, in seconding the resolution, said he wished to refer to the Metropolitan Poor Act, 1867, Section 20, which

was as follows: "Where the asylum is provided for reception and relief of the sick or insane it may be used for purposes of medical instruction and for the training of nurses, in such cases and manner and subject to such regulations as the Poor Law Board from time to time by order direct." That was Mr. Gathorne Hardy's Act. Unfortunately the Poor Law Amendment Act of 1880 came in, and by Section 20 it was enacted, "So much of the twenty-ninth Section of 'The Metropolitan Poor Act, 1867' as authorises the use of any asylum for the sick or insane for the purposes of a medical school is hereby repealed." They wished the Parliamentary Bills Committee to have that Section 20 of the Metropolitan Poor Act of 1867 repealed, so that medical students might be instructed in practical midwifery. Dr. Drage had referred to the infamous fact that the ordinary man could now be turned out as a duly qualified medical practitioner to practise midwifery on his having a certificate that he had personally conducted only three cases of labour. He considered that—and there were two members of the General Medical Council present—a disgrace to the General Medical Council. As regarded the opening up of the infirmaries for clinical instruction, by the Poor Law Act, 1880, Section 4, the Metropolitan Asylums Board had now the power of opening their fever hospitals for the clinical instruction of medical students. Also by the Galway Hospital Act of 1892 the County Infirmary had been opened lately for the instruction of medical students. He further wished to refer to the report of the Select Committee of the House of Lords on Poor-law Relief in 1888, which backed up the motion of Dr. Drage. The House of Lords reported as follows: "We are disposed to agree with Dr. Bridges, the Local Government Board Medical Inspector for London, that with proper precautions clinical teaching should be allowed in the interests of the patients of the infirmary, and also in the interests of the public. The infirmaries are now very large and important establishments. At the Kensington Infirmary there are over 600 patients, and there seems to be no reason why, since large numbers of poor patients are treated in hospitals without any objection on their part to clinical teaching, the poor should feel repugnance to such teaching in infirmaries. Dr. Bridges pointed out that a special ground for giving the medical profession access to the infirmaries is that many patients suffering from obscure and chronic disease are treated in the infirmaries who cannot be admitted into hospitals." Then the Select Committee of the House of Lords on Metropolitan Hospitals in 1892 reported in the same way. Those were the Acts of Parliament and reports of Select Committees of the House of Lords who had considered this matter. He asked the Parliamentary Bills Committee to take that matter up, and say that the large field of clinical material which existed in their Poor-law infirmaries at present might be opened for the clinical instruction of ordinary students in practical midwifery. [Applause.]

The PRESIDENT said that he would first put the motion for the adoption of the report, and if that was passed Dr. Drage's resolution could then be submitted to the meeting as a rider.

The motion for the adoption of the report was put and carried by a large majority.

Mr. RICHES, in supporting Dr. Drage's rider, said that in Manchester the midwifery cases were taken up by the midwives, and the students had to get their instruction in practical midwifery from the midwives. The certificates of attendance on midwifery cases by midwives were accepted, and he suggested that that was a question to which the attention of the General Medical Council should be drawn.

Dr. DRAPER added that the midwives had to be tipped.

Dr. LOVELL DRAGE's rider was then put to the meeting and carried.

Direct Representatives on the General Medical Council.—Dr. KENTON then moved:

That as Sections 7 and 8 of the Medical Act, 1886, provide for the election of only five direct representatives to the General Medical Council by the registered medical practitioners resident in the United Kingdom; and as Section 10, Subsection 1, Paragraph c of this Act provides that the General Medical Council may represent to the Privy Council that it is expedient to confer upon the registered medical practitioners resident in any part of the United Kingdom the power of returning an additional number of direct representatives to the General Medical Council; and

as the General Medical Council has, on November, 1890, on November, 1891, and on November, 1892, refused absolutely to make such representation; and as the number of registered medical practitioners has increased from 22,718 in 1876 to 32,094 in 1894; and as we medical practitioners were not given our due and proper number of direct representatives in 1886; and as the registered practitioners contribute all the income of the General Medical Council, by which the Medical Acts are administered, while the twenty universities and colleges represented on the General Medical Council do not contribute any income to it; and as the representatives of the universities and colleges are elected to the General Medical Council by their small Convocations, Senates, and Councils, and not by open vote of all their medical graduates only; and as other important councils, having similar but larger duties to the General Medical Council (such as the Councils of the Incorporated Law Societies of England and of Ireland, the Councils of the Pharmaceutical Societies of Great Britain and of Ireland, and the Council of Veterinary Surgeons) consist of direct representatives only, this Association instructs its Council to take immediate steps to have a Bill introduced into Parliament providing that the registered medical practitioners in England and Wales be empowered to elect five additional direct representatives, the practitioners resident in Scotland one additional direct representative, and the practitioners resident in Ireland one additional direct representative to the General Medical Council.

He said that according to the Medical Act of 1858 they were given no direct representatives whatsoever on the General Medical Council, although they had made that request as early as 1843 by the Bill then introduced into the House of Commons. But from 1858 onwards Mr. Wheelhouse, Sir Walter Foster, Dr. Leech, and others, more especially Dr. Waters of Chester, worked hard in favour of the proposal of the Association having direct representation on the General Medical Council, and when the Medical Act of 1886 was passed they were given direct representation, but on a very small scale indeed. England was given three members, Ireland one, and Scotland one, so that at present they only had five direct representatives. Since then they had been pretty busy trying to gain increased representation. In 1890 he (Dr. Renton) had brought up a notice of motion at the annual meeting, and as usual it was referred to the Council of the Association, and nothing whatever was done. At the annual meeting in 1891 he had again brought up the notice of motion, and again nothing whatsoever was done. In 1892 they sent a petition to the Council to increase their direct representation. With regard to what had been done by the General Medical Council, in 1890 Sir Walter Foster brought up a notice of motion to give the Association increased direct representation, but so determined was the General Medical Council not to give Sir Walter Foster even an opportunity of taking a vote upon the subject that the "previous question" was moved and carried by a majority of 20 to 5. In 1891 Sir Walter Foster again brought up the subject before the General Medical Council, and on that occasion, although they allowed him to debate the subject, he was defeated by 21 to 5. Again in 1892 Sir Walter brought it up, but discussion was smothered, and the result was that the "previous question" was again carried by 16 votes to 9. He brought those facts before them to show that there was no good whatever in losing any more time in appealing to the General Medical Council or to the Privy Council. No doubt Section 10 of the Medical Act of 1886 gave the General Medical Council the power to recommend to the Privy Council that an increased number might be granted, but the word "may" frequently occurred in that section, and his experience of that word in an Act of Parliament was that it should always be read "shall not." A very important question was, Had the growth of the medical profession been such as to justify an increase in direct representation? In 1886, when direct representation was first granted, England had 16,978 registered medical practitioners, Scotland 2,372, and Ireland 2,501. Those figures showed that when direct representation was granted, in 1886 the practitioners resident in England and Wales had only 1 direct representative to every 5,659 practitioners, while the practitioners in Ireland had 1 to 2,501, and in Scotland 1 to 2,372. It would be seen that the proportion of direct representatives given to the practitioners resident in England was altogether out of harmony with the number given to those in Scotland or in Ireland. Comparing those figures of 1886 with those of 1894, in 1894 there were 20,467 practitioners resident in England, 3,107 in

Scotland, and 2,485 in Ireland. Those figures showed that the number of practitioners resident in England and Wales had increased from 16,978 to 20,467, in Scotland from 2,372 to 3,107, and in Ireland they had decreased from 2,501 to 2,485. The fact, also, that the number of practitioners on the *Medical Register* in residence in England, Ireland, and Scotland had increased from 22,718 in 1876 to 32,094 was an additional argument in favour of increased direct representation. Another point to be discussed was, should the General Medical Council be composed entirely of direct representatives? [Yes.] At present the universities and colleges had 26 representatives on the General Medical Council, while medical practitioners had only 5. He had taken the trouble to refer to the positions of the councils of other bodies, and found that the Council of the Incorporated Law Society of England and Wales had 40 direct representatives only, and no other representatives whatsoever, the Council of the Incorporated Law Society of Ireland had 43 direct representatives and no other, the Council of the Pharmaceutical Society of Great Britain had 21 direct representatives and no other, the Pharmaceutical Society of Ireland had 21 direct representatives, and the Council of the College of Veterinary Surgeons, England, had 32 direct representatives, so that those councils of solicitors, chemists, and veterinary surgeons had none but direct representatives on their council. [Applause.] Those councils had equally important duties to perform as the General Medical Council; they had to administer the Solicitors', the Veterinary Surgeons', and the Chemists' Acts, they had to keep a Register, and deal with certain penal cases. But they had a much higher duty to perform, because they had the one-portal system, and they conducted the examinations themselves. If those councils were able to do all that, he thought the practitioners were at least entitled to an increase in the number of their representatives on the General Medical Council. Other medical councils in other countries had a large number of direct representatives. In the Cape of Good Hope the Medical Council, with a total number of 4 members, had 4 direct representatives; Ontario, Canada, 17 out of 27; Quebec 40 out of 49; New Brunswick 5 out of 9; and the North-Western States, Manitoba, and British Columbia, 5 out of 5. They had been told by their opponents that the representatives of the universities and colleges and the Privy Council represented the medical practitioners. [No.] Dr. MacAlister some time ago, when Sir Walter Foster brought the question up before the General Medical Council, had said he represented the medical practitioners in England. He had looked into the matter, and found that, although Dr. MacAlister had a constituency of about 5,000 voters, there were only about 270 medical practitioners in that constituency, and Dr. MacAlister was therefore elected to the General Medical Council largely by Doctors of Music, Doctors of Theology, and Doctors of Law. [Laughter and applause.] The same was true with regard to the representative of the Royal College of Surgeons of England on the General Medical Council. He was elected by 24 Fellows, and opposite that there were 16,738 Members of the College of Surgeons who could not say a single word with regard to the election of College representatives on the General Medical Council. [Shame.] Those facts showed that it was absurd for anyone to say that the representatives of the universities and colleges represented the medical practitioners. Another very important point was that if representation and taxation went together, the medical practitioners contributed all the funds which administered the Medical Acts. [Applause.] From 1859 up to 1890 the medical practitioners had paid no less a sum than £155,285 in registration fees. It was said that the General Medical Council was too large. He did not think so, but he would suggest that the five nominees of the Privy Council should be done away with. He had looked into the councils of other bodies, and had never been able to find that the Government had so much distrust in any of them as to say, "We must place five Crown nominees to see whether you perform your duties properly." He thought, therefore, the five nominees of the Privy Council should be done away with and given to medical practitioners. The Medical Act of 1886 allowed the General Medical Council to make a recommendation to the Privy Council when an examining body had

sunk in importance. There were some examining bodies out of the twenty-one which had sunk considerably in importance, such as the Apothecaries' Hall, Ireland, which granted from fifteen to twenty diplomas every year, and therefore he proposed that if the General Medical Council really wished to lessen their number, the Apothecaries' Hall should combine with the College of Surgeons, Ireland, to elect one representative; the Apothecaries' Society, England, with the College of Surgeons, England; and the University of St. Andrews with Aberdeen, to collectively put one member into the General Medical Council. If that were done it would reduce the General Medical Council from thirty to twenty-one, and if they would give the practitioners that increase of direct representatives which they asked for, it would still keep the Council to twenty-eight. He thought their request was very small indeed. [A Voice: "Too small."] Most members of the Association thought that the Council should be composed entirely of direct representatives. [Applause.] He would suggest that they should give the General Medical Council no chance whatever of refusing that very mild request, and had great pleasure in proposing the motion which he had read.

Dr. HUGH WOOLLS, in seconding the proposition, said the only fault he found with it was that it did not go far enough. [Hear, hear.] He should have been much better pleased to have seconded a proposal to the effect that the medical profession was now at last capable of governing itself. [Applause.] When they considered that the governing body of the medical profession was elected chiefly by persons utterly ignorant of medical matters, he thought it was simply disgraceful. When they considered that that body had the power of life and death over them, professionally, it seemed to him they had no sort of self-respect to allow themselves to be placed under such a government, over which they had no control. Everyone knew about the General Medical Council's life. He did not wish to say anything disrespectful about so august a body, but it was obvious that the decay of old age was present. It passed a resolution and then could not act upon it, and the next time it met thought it had gone too far, and went back. There was nothing but feebleness from beginning to end in the whole of its deliberations. It could hardly be expected that the General Medical Council would deal with the matters concerning the profession, because it was ignorant of them. The majority of the members of the General Medical Council knew absolutely nothing whatever of the conditions of general practice. They had had before them recently such a question as the Midwives Bill. Except Dr. Glover, was there anyone there who knew anything about midwifery practice? There might be one or two others, but hardly any of them knew anything about it, but they had to deal with it. They had to deal with medical education, whereas a great many of them knew remarkably little about the conditions under which the doctors would have to practise when they went out into the world. The consequence was that their recommendations became as ridiculous as that a man should be turned out to practise midwifery after having attended three cases. That of itself was enough to show the way in which they conducted their deliberations and their competence for doing it. He did not think that the resolution went half far enough, but inasmuch as it would to some extent go towards making the medical profession have almost an even voice in the election of the governing body of the medical profession he thought it deserved their hearty support. He hoped that at no very distant date they would find the medical profession electing its own governing body. [Applause.]

Sir WALTER FOSTER said it was refreshing to him to hear the General Medical Council abused in the good wholesome way which had been adopted by the last speaker. It took him back ten or fifteen years to the time when they were struggling to obtain the Act of 1856. That Act did give them representation, and it certainly was not his fault nor that of Mr. Whitchouse, his colleague, if that representation had not been increased. He wished to say a few plain words to the members of the Association, words which he thought they deserved. Their representatives had fought their battle in the Council, as Dr. Kentoul had told them. On three separate occasions they brought the matter forward, pressing

upon the General Medical Council the urgent necessity of giving the profession proper representation on its own body, and taking steps to get it. On each occasion in his speeches which had been published, he (Sir Walter Foster) had appealed to the medical profession for support, and had had no support whatever from the great body of the profession. He did not think it was right. [Applause.] If he was sent to the Council to fight the battles of the profession they ought to support him. [Applause.] The last time he brought up the motion he obtained statistics similar to those brought forward by Dr. Kentoul, and he told the Council that he was prepared to bring the resolution forward every year, and that they could, if they chose, pass the previous question and have the names taken down so that the profession might see who voted one way or the other. He was prepared to do it every year, and he would do it every year, but he asked the medical profession to show in the meantime their opinion of the course of the General Medical Council's procedure. What answer did he get? There had not been a single petition sent up to the Council nor any steps taken by the profession at large to bring the General Medical Council to its proper senses. He was glad that they were going to take a step that day, because it would at all events show the General Medical Council that the profession was feeling in earnest about the matter, and if they were in earnest they could carry it sooner or later. [Applause.] He had been particularly disappointed that the medical profession had not taken any step for the last three years. During the last three years there was a Government in power in which he had some little influence, and he could have got a certain access to the Privy Council at all events, and could have laid their representations before the Privy Council and obtained for them a consideration which he could not hope to obtain under the existing Government. The majority, however, of the gentlemen present might have more influence with the existing Government than he had. [Laughter and applause.] He wished them to use their influence. [Laughter and applause.] He had failed to use his during the three years that he had an opportunity, and he wished them now to set their hearts to this work, and determine to use their influence with the present Government, in order to get the matter looked into. There were ways in which it could be done. First of all, when they had passed this resolution they should make up their minds that the profession at large should send up petitions from every Branch of the Association to the General Medical Council, pressing this upon their notice, and demanding that the Council should of its own accord take steps to increase their representation. At the same time every petition of that kind should be sent in duplicate to the Privy Council, and possibly a third to the House of Commons, so as to show the legislative body of the country that they were determined to do something in the direction of getting a just share of representation on the General Medical Council. [Applause.] Over and above that, it would be a wise plan for the Parliamentary Bills Committee, when that resolution was passed, as he hoped it would pass, to draw up a short Bill—not a general amendment of the Medical Acts, but a short Bill directed to this specific point of increasing the direct representation of the profession on the General Medical Council. He was anxious that should be done for several reasons. In the first place, England and Wales had not its proper proportion of the representation under the present system; secondly, he believed they would never do as much good as they ought to be able to do through the General Medical Council till they had the more wholesome element of direct representation largely increased. He had spent about nine years in their service at the General Medical Council, and he had never sat on any body that were so absolutely beyond the reach of argument as they were. [Applause.] There was no harder task that could be given to any man—and he had had some experience of hardship in his life—than to go to the General Medical Council to fight the battle of the general representatives. The profession had the matter in its own hands, and he hoped from that day forward it would not rest until by some method or other an increase in the direct representation on the General Medical Council had been achieved. If they did that they would add one of the greatest forces to the ennobling

of the medical profession, the improving its discipline, and the preventing of any encroachments upon their rights which from time to time they were obliged to resist. [Applause.]

Mr. WHEELHOUSE (in response to repeated calls) said they knew perfectly well from what had been published that Sir Walter Foster had, as he had said, done his utmost to bring this matter before the General Medical Council. He (Mr. Wheelhouse) and the other representatives had done their best also, but what could they do when they were 5 to 25, and when they knew that those 25 believed that the Council was already too large and believed that no further direct representation was necessary? They had fought the fight, and had done so as earnestly and as stoutly as they could, and, as Sir Walter Foster told them, they had looked for support to the outside world and had got absolutely none. They had not had a petition sent; they had not had any backing sent to them in any shape or way whatever. He therefore agreed with Sir Walter Foster that it was an absolutely hopeless fight so far as they were concerned. If the profession would be true to itself and would join shoulder to shoulder to advance its own interests, then they would have some chance of doing good, but until then he felt that they might bring this resolution before the Council year after year, well knowing that it would be simply so much time wasted. He wished to add one word as a matter of justice with regard to what Dr. Rentoul had said on the midwifery question. They must not suppose for a moment that the General Medical Council had never discussed this question of three labours being sufficient medical education. But that was a Scotch question, and when they came to consider a number of students in the Scotch schools, and to consider where they were to find this material for their instruction, say, supposing there were a thousand students in the schools, and each student was to have 30 cases, where were they to find the 30,000 women to provide them with the necessary practice? The Scotch people said they could not do it, and that there was not the material, and it could not be got. [Laughter.] They had to go to Ireland to get it. [Laughter.] They seemed therefore to pin their faith to the fact that a man clinically and carefully instructed by the midwifery professor through three cases had learned as much as a man who upon his own instigation went to and attended 30 cases—that was to say, rush to a house when he was told there was a woman in labour, put his hand on the bedpost, and then considered that he had attended a labour perfectly. [Applause.]

Mr. TAIT said they had been told by Dr. Rentoul that resolutions similar to those had been passed not once or twice but three times at general meetings of the Association. What had become of those resolutions? Were they to understand that upon a serious matter of that kind the members were to pass resolutions year after year, asking the Council to do something, and were those resolutions to be buried?

Sir WALTER FOSTER said whenever he had brought the matter before the General Medical Council he had quoted the resolutions passed at those meetings.

Dr. WARD COUSINS: I may say on behalf of the Council that the recommendations of the annual meeting to the Council have been carried out. The resolutions were to be sent on to the Privy Council, and the wishes of the meeting were carried out on both occasions. [Applause.]

Dr. DOUGLAS asked whether the meeting was to understand by the statement made by Mr. Wheelhouse that the necessities of the Scotch schools made three labours sufficient for each student to pass in midwifery.

Mr. WHEELHOUSE explained that the Scotch representative, Dr. Leishman, always went upon the argument that careful personal instruction in three cases of natural labour was better than mere attendance without personal instruction on a greater number.

Dr. DOUGLAS said he was sure there was no general practitioner present who knew anything about midwifery that would not give a flat denial to the assertion that three labours were sufficient. [Applause.] They all had the greatest respect for all that Sir Wheelhouse had done, but he thought it would be a very bad thing if the statement was allowed to go forth from the meeting without some notice being taken of it.

Dr. RENTOUL said the Scotch schools were so busy training pupil midwives, that they found when they came to train medical students in practical midwifery they had not sufficient cases for them. He was told that in Liverpool the medical students had to be taught by the midwives, and he and she, and perhaps a pupil midwife, went to conduct a case and there was no doctor whatsoever. He was told that in Scotland, and more especially Glasgow, it was very much worse.

Dr. HOLMES said he could contradict Dr. Rentoul with regard to Edinburgh; the students were under the care of a fully qualified medical man.

The resolution was then unanimously adopted.

Procedure and Constitution of the Association.—Dr. DOUGLAS said that Mr. Victor Horsley had made a statement on the previous day and had repeated it again at that meeting that the constitutional mode of procedure or constitution of the Association required that matters should be referred to the Branches, and by the Branches to the Council, and then brought before the general meeting. He did not think that that was correct, for he understood that the Association was constituted as a limited liability company under certain special provisions, and that a resolution of which proper notice had been given, having been brought before the general meeting and passed, was binding upon the Association.

Dr. WARD COUSINS read the by-law relating to the matter and stated that any notice could be given by any member and the business would then come on exactly in the same way as the annual meeting as had been done on the present occasion.

Mr. BUTLIN said that Mr. Victor Horsley's statement was not authoritative; he was not a member of Council and it was a question that must be decided between them: it was not for the Association.

Mr. VICTOR HORSLEY said that exception had been taken to his use of the word "constitution." It was perfectly correct to state that they were more or less a limited liability company, and he held that after general politics the persons who had the power were those who elected their representatives.

Scientific Grants Committee.—Dr. WARD COUSINS moved:

That the report of the Scientific Grants Committee for the year ending December 31st, 1894, be received and adopted.

Sir T. GRAINGER STEWART, in seconding the motion, said that though the progress made by the Committee might appear to be slow, they were working hard in the accumulation of facts. They were doing their work well, and as far as he knew the results obtained had been of great importance.

The resolution was agreed to.

Legislation for Inebriates.—Dr. NORMAN KERR, in moving the adoption of the report of the Committee on Legislation for Inebriates, proposed that the name of Sir Walter Foster should be added to those members who were proposed to be reappointed. He had been a member before his appointment at the Local Government Board, and now that he was free the Committee would be very glad to welcome him back again. [Applause.] Dr. Kerr called attention to the fact that within two years three Departmental Committees had arrived at conclusions endorsing the position taken up by the Association for so many years, that a different procedure was necessary with inebriates, especially criminal inebriates—namely, that they should be treated therapeutically, and not as criminals. The greatest feature of last year was that after a long struggle of a quarter of a century or more they had seen the Government of this country bring forward a Bill not only embodying all the propositions which they had been endeavouring to advocate, but going further—in fact, too far, as some thought—embodying all that they had asked or hoped to get in the way of legislation. That Bill had passed a second reading of the House of Lords notwithstanding some opposition. It gave a power of compulsion in the case of both criminal and non-criminal inebriates: it provided for the treatment of the poorest of the land and dealt with all forms of intoxication, whether by morphine or alcohol. He was glad to say that the Lords did not seem to object to that part of the Bill having reference to criminal drunkards, and there was very great hope that the present Government, or the Government

which succeeded it would take up that part of the Bill, as had been done by the late Government. Some objection was made by Lord Salisbury and others to the provisions affecting the non-criminal habitual drunkards and the ground of the liberty of the subject being interfered with. He wished to point out that such interference was not new, but had already existed in the case of lunacy, and unless noble lords were prepared to go back and undo all that had been done in the way of legislation with regard to lunacy, the objection was entirely out of court. He claimed that under the proposed system there would be no danger of any person being wrongfully treated, and was sure that those who had any knowledge of the condition of inebriates would see that any such idea was entirely a bugbear. Restrictions could be made so as to prevent any possible abuse of the liberty of the subject. He said that in one province in France, the Department of the Seine, an asylum was being built by the Government for 500 drunkards. He claimed that this question was one that should be outside of party politics, and he believed that if such a scheme as that contained in the Bill was carried out it would be one of the greatest things that had ever been done in England in order to secure the freedom of the whole community.

Dr. WARD COUSINS seconded the resolution.

The resolution was carried unanimously.

Therapeutic Committee.—Dr. CROCKER in moving that the report of the Therapeutic Committee for the year ending December 31st, 1894, be received and adopted, said that the committee had never done better work than during the past year. The revision of the *Pharmacopœia* was in progress, and over 12,000 circulars had been sent out asking what drugs might be done away with, and for the opinions of different members. Over 6,000 replies had been received, and the report they were able to give to the Pharmacopœia Committee was so valuable that Dr. Tizard, the Chairman of the Therapeutic Committee, was unanimously put upon the Pharmacopœia Committee.

Mr. JONES MORRIS seconded the motion, which was agreed to.

Medical Charities Committee.—Dr. BRIDGWATER, in moving the report of the Medical Charities Committee, said that it had done a great deal of work all through London. It was now making inquiries in the provinces, and they hoped by the end of next year to have something tangible and suggestive to lay before the Association.

Mr. GEORGE BROWN seconded the motion, which was agreed to.

Rashers' Servants' and Mariners' Eyesight Committee.—Dr. BRUCE GORE, in moving the adoption of this report, stated that the Committee was an important one, and had done a great deal of good work. They had received a great deal of support in the recommendations which had been made to the authorities.

Dr. CAMPBELL seconded the motion, which was agreed to.

Mental and Physical Conditions of Children Committee.—Dr. BRIDGWATER moved:

That the report of the Committee on the Mental and Physical Conditions of Children for the year ending December 31st, 1894, be received and adopted.

It deserved a great deal to be said about it, and he only refrained from doing so owing to the lateness of the hour. It was a report dealing with 100,000 children, who had each been examined carefully as to all its peculiarities and defects, and when it was published, as they hoped it would be during next year, it would be highly valued by the profession at large.

Dr. RENTON seconded the motion, which was agreed to.

Anæsthetics Committee.—Mr. EASTER, in moving the adoption of the report of this committee, stated that they had already held 67 meetings, lasting two hours each, so that he thought they would agree the Committee had not been idle.

Mr. JENNER seconded the motion, which was agreed to.

Dr. WARD COUSINS stated that the thanks of the members were due to Dr. RENTON and to Dr. FENWICK for having shortened the business considerably by withdrawing the resolutions which stood in their names.

That concluded the proceedings.

THIRD GENERAL MEETING OF MEMBERS—THURSDAY, AUGUST 1st.

The PRESIDENT (Sir J. RUSSELL REYNOLDS) in the Chair.

The third general meeting of members was held on Thursday afternoon in Exeter Hall, when the address in Surgery was delivered by Mr. Jonathan Hutchinson. (See page 273.)

Dr. WARD COUSINS said that Mr. Jonathan Hutchinson had begun by stating that there was nothing very original in his address, but they all knew that no one had contributed more to the progress of surgery during the last thirty years than he had done. The evolution that he had given of some of the major operations of surgery, such as lithotomy and ovariotomy, undoubtedly came with a master touch. He had told them how by slow and steady stages, one little detail being added to another, they had now reached their grand maturity. Mr. Hutchinson had hinted at the absolute necessity, with a skilled hand, of early diagnosis in cancer, and he felt confident that the reference in the address to that important topic would be read by the whole Association with the very greatest satisfaction. [Applause.] Mr. Hutchinson's remarks with reference to the necessity of every medical man, when he became a Member of the College, feeling then that his professional career was really commencing, that he had to learn the whole of the art both of medicine and surgery, he hoped would be remembered by those who were now getting their diplomas from the corporations and universities. They might depend upon it that they could not do better than imitate the master who had addressed them, and feel every day of their lives that they must be students. Although it was not likely that many of them would be able to follow Mr. Hutchinson in daily accumulating clinical materials and utilising them for the benefit of the world, yet let them imitate him; and he was sure they would all join in the hope that his valuable life by the blessing of Providence might long be spared, and that he might long continue to prosecute those studies, and to accumulate those materials which he had utilised so grandly for the benefit of mankind. He had the greatest pleasure in proposing that the best thanks of the Association be presented to Mr. Jonathan Hutchinson for his able address.

Mr. MACNAMARA, in seconding the vote said the impression made upon his mind by the address they had just heard might be summarised almost in one word, namely, that it was thoroughly English and thoroughly practical. [Applause.] It was also thoroughly honest. Mr. Hutchinson came before them and said that after he tried lithotomy and found he was not able to succeed as well as some of his colleagues he at once made over his patients to those colleagues. In ovariotomy also when he found that his ovarian cases were not doing so well in the large hospital to which he was attached as they might have done in a special hospital, he at once sent the patient to that particular hospital. That was an example to them all as showing that the first thing they had to consider was the good of their patient. [Applause.] The address was practical from beginning to end, as the whole of Mr. Hutchinson's life had been. [Applause.] His mind was one of those that ran on observation. His conclusions were all drawn from facts which he had himself observed and collected year after year, bringing them together and showing by the results obtained the great advantage this mode of study had been to the profession and, he might almost say, to the human family.

The PRESIDENT said he felt, as he did yesterday after the address of Sir William Broadbent, that it was almost a matter of absurdity to put a vote of thanks to the meeting, for he felt absolutely certain that their thanks were already granted to Mr. Jonathan Hutchinson for his wonderful address. [Cheers.] He (the President) was no surgeon, but he was very much interested in the history of surgery, and during the whole address he had felt that he was listening to a master. [Cheers.] He was perfectly certain the members would all agree with him, and he would not put it to the vote, but ask them to render thanks to Mr. Jonathan Hutchinson. [Cheers.]

Mr. JONATHAN HUTCHINSON, in reply, said: I will not detain you with any long speech, but just simply say that from my heart I thank you. [Loud cheers.]

[To be concluded.]

NAVAL AND MILITARY MEDICAL SERVICES.

ARMY MEDICAL STAFF EXCHANGE.

The charge for inserting notices respecting Exchanges in the Army Medical Department is 2s. 6d., which should be forwarded in stamps or post office order with the notice. The last post on Wednesday is the latest by which these announcements can be received.

A BRITISH LIEUTENANT COLONEL, expecting to be ordered abroad into the tropics, wishes to exchange with an officer lately home, or would exchange to a Mediterranean station or colony for part expired tour. Address, Manager, office of BRITISH MEDICAL JOURNAL.

MEDICAL VACANCIES.

The following vacancies are announced:

ANCOATS HOSPITAL, Manchester.—Junior House-Surgeon. Salary, £60 per annum, with board and washing. Must be qualified and on the Medical Register. Applications at once to Alex. Forrest, Honorary Secretary.

CHARING CROSS HOSPITAL MEDICAL SCHOOL.—Lecturer on Physiology. A minimum of £300 a year guaranteed, together with a grant for working expenses. Applications to the Dean, 55, Chandos Street, W.C.

CUMBERLAND INFIRMARY, Carlisle.—House-Surgeon. Salary, £70 per annum, with board, lodging, and washing. Appointment for one year. Applications to the Secretary by August 24th.

CHICHESTER INFIRMARY.—House-Surgeon. Salary, £80 per annum with board, lodging, and washing. Applications to the Secretary by August 18th.

DR. STEVENS'S HOSPITAL, Dublin.—Ophthalmic Surgeon. Applications to the Secretary before August 7th.

DURHAM COUNTY ASYLUM.—Pathologist and Junior Medical Officer. Salary, £100 per annum, with board and lodging. Applications to the Superintendent, Durham County Asylum, Winterton, Ferryhill, by August 10th.

DEVON AND EXETER HOSPITAL, Exeter.—Assistant House-Surgeon; doubly qualified and unmarried. Salary, £40 per annum, with board and lodging, not including alcoholic liquors and aerated waters. Applications to Albert E. Boyce, Secretary, by August 18th.

EAST SUFFOLK AND IPSWICH HOSPITAL, Thoro'fare, Ipswich.—Second House-Surgeon; unmarried; doubly qualified. Salary, £70 per annum, with board, lodging, and washing. Applications to the Secretary by August 18th.

GRAVERHES HOSPITAL.—House-Surgeon; doubly qualified. Salary, £60 per annum, with board and residence. Applications to Frederick Mitchell, Honorary Secretary, by August 8th.

HULME DISPENSARY, Dale Street, Stretford Road, Manchester.—House-Surgeon; doubly qualified. Salary, £120 per annum, with apartments, water, coal, and gas. Applications to the Honorary Secretary Medical Committee by August 14th.

LIVERPOOL INFIRMARY FOR CHILDREN.—Assistant House-Surgeon. Appointment for six months. Board and lodging provided but no salary. Applications to C. W. Carver, Honorary Secretary, by August 18th.

LINCOLN COUNTY HOSPITAL.—Assistant House-Surgeon. Appointment for six months, but eligible for re-election. An honorarium of £25 for each period of six months, subject to the approval of the Weekly Board, with board, residence, and washing. Applications to the Secretary by August 18th.

ROYAL EAR HOSPITAL, Frith Street, Soho Square, W.—Assistant Surgeon. Applications to Donald Murray, Honorary Secretary, by August 18th.

PARISH COUNCIL OF NORTHEAVINE, Shetland.—Medical Officer. Salary, £20. Applications to the Clerk, Parish Council, North-eavine.

ST. BARTHOLOMEW'S HOSPITAL.—Physician and Assistant Physician. Applications to Wm. Henry Cross, Clerk, by August 8th.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 2s. 6d., which should be forwarded in post office order or stamps with the notice and later than Wednesday morning, in order to ensure insertion in the current issue.

BIRTHS.

MACFARLANE.—On July 24th, at 41, Buckley Road, Bromesbury, London, N.W., the wife of H. J. Macfarlane, M.D., B.Sc. Lond., of a daughter.

MACINTOSH.—At 13, Abercromby Place, Stirling, on July 7th, the wife of William A. Macintosh, M.B. Edin. and C.M., of a son.

GORDON.—The wife of Surgeon-Captain P. C. H. Gordon, A.M.S., at Mussoorie, India, of a daughter, on July 8th, 1895.

MARRIAGES.

SPEECHLY-BARRETT.—On Tuesday, July 20th, in the Parish Church, Neston, Cheshire, by the Rev. A. W. Humphreys, assisted by Canon Turner, the Vicar, Harry Martindale Speechly, M.R.C.S. Eng. L.R.C.P. Lond., of Parkgate, Cheshire, eldest son of the Right Rev. Bishop Speechly, to Mary Barrett, B.A. Vict. Univ., eldest daughter of the late Rev. W. F. Barrett, formerly Head Master of Mostyn House School and Senior Curate of Neston.

FRANGLEY-DONNETT.—On July 18th, at St. Paul's Church, Upper Norwood, by the Rev. W. H. Graham, assisted by the Rev. C. W. Frangley,

consin of the bridegroom, Henry John Frangley, L.R.C.P. Lond., M.R.C.S. Eng., of Tudor House, Asbury, only son of the late John Feard Frangley, of Hestonbury, Wiltshire, to Clara Elizabeth, youngest daughter of Charles William Donnett, of Moorfield, Asbury. No cards. At home September 6th, 10th, 11th, and 12th, 5 to 6 P.M.

DEATHS.

MARSHALL.—On July 28th, at his residence, 17, Liverpool Street, Dover, Dr. John Marshall, J.P., aged 64 years. No flowers.

LETTERS, COMMUNICATIONS, ETC., have been received from:

(A) D. W. Aitken, M.B., Edinburgh; Mr. F. Addiscott, London. (B) W. T. Brooks, M.B., Oxford; Mr. A. E. Boyce, Exeter; Messrs. J. Hale and Sons, London; Mrs. A. S. Ballin, London; British Laryngological and Rhinological Association, London; Mr. W. L'H. Biekenue, Leicester. (C) Mr. W. S. Coleman, London; Dr. C. Coppinger, Dublin; D. E. Cantillon, M.B., Little Island, co. Cork; Continental; C. W. J. Cullen, M.B., St. Boswells; Mr. F. E. Clarke, Batna-de-Bormio. (D) Messrs. Dowden and Co., Bournemouth; Messrs. Danielsson and Co., London; Dental Hospital of London, The Secretary of, London; Mr. W. J. Duff, London; Mr. J. V. Davy, London; Dr. O. R. Drysdale, London. (E) Fairplay; Mr. T. E. H. Fisher, London; Mr. A. Forrest, Tunbridge Wells. (F) Dr. H. R. Greene, Woking; C. H. Golding Bird, M.B., London; Dr. E. W. Goodall, London; Messrs. G. Gale and sons, London. (H) D. J. Hamilton, M.B., Aberdeen; Dr. J. O. Horden, London; Dr. W. A. Hardaway, Saint Louis; H. E. W.; Dr. W. M. Hutton, Edinburgh; F. P. Hearder, M.B., Wakefield; Hon. Secretary; Mr. W. Hayle, Halifax. (I) Dr. H. J. Holt, Bromley; Inspector; Mr. W. Hiffe, Derby. (J) Dr. W. Jones, Rushon; Mr. G. A. Jones, London. (K) Mr. R. T. Kent, Glasgow; Miss M. King, Kirkby Stephen; Mr. C. T. Kingzett, London. (M) Mr. C. D. Marshall, London; A Medical Student; Dr. H. Malet, Wolverhampton; A. E. Maynard, M.B., Glasgow; Mr. H. J. W. Martin, London; Mr. M. Mailer Kendal, Sydney, N.S.W.; Mr. R. Martin, Gifford, co. Down; Dr. R. Mapler, Newbury. (N) Mr. J. H. Norman, Winkleigh; National Society for the Employment of Epileptics, The Secretary of, London; Mr. P. Newell, Crowthorpe. (P) Mr. W. H. Pearce, London; Mr. A. Paterson, Liverpool; Mr. S. Paget, Bude; Mr. W. H. Palma, London; Mr. A. Powell, Cachar, E. Bengal; Dr. W. H. Putney, Bournemouth; Mr. H. A. Powell, Folkestone; Progress; Mr. H. N. Penny, Hong Kong; Mr. W. Porritt, Orange Free State; G. S. Perkins, M.B. London. (R) Professor R. T. Roussel, Geneva. (S) Mr. J. H. Smith, London; Mr. J. A. Southern, Derby; Mr. S. Simmonds, London; Dr. A. T. Schofield, London; A. M. Shield, M.B., London; Mr. R. V. Sutton, Newport; Mr. H. T. Sells, Northfleet; Dr. F. Semon, London; Mr. W. Shepperson, Tring; R. W. Smith, M.B., Sheffield. (T) Mr. G. H. Turner, Derby; Mr. J. Tomes, Caterham, Valley; Mr. M. Townsend, London; Mr. A. Thorne, London. (V) Miss Valentine, Ramsey. (W) D. Walsh, M.B., London; Mr. Julian Willis, London; Mr. T. Wilmot, Bradford; Mr. B. Wainman, Bynhill; Rev. W. S. Wrenford, Walstead on Tyne; Dr. E. F. Willoughby, London; G. E. Williamson, M.B., Newcastle-on-Tyne; Mr. A. Winkfield, Oxford; Mr. H. T. Wood, London; Mr. T. E. Williams, Talgarth; Mr. H. Webber, Rickmansworth; Dr. F. R. Walters, London W.M.; Wilhelm Meyer Memorial Committee, The Chairman of, London; Mr. J. P. Wilton, Weymouth; Mr. W. P. Warner, Novin. () Mr. A. F. Yarrow, London; etc.

BOOKS, ETC., RECEIVED.

Margate as a Health Resort. By Dr. H. E. Crook. Fourth Edition. Margate: H. Kettle. 1895.

Educational Handwork. By Dr. W. Goetze. London: O. Newmann and Co.

Gunshot Injuries; their History, Characteristic Features, Complications, and General Treatment. By Surgeon-General Sir T. Longmore, G.B. Second Edition. London: Longmans, Green and Co. 1895.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

Eight lines and under	20	4	0
Each additional line	0	0	6
A whole column	1	17	6
A page	5	5	0

An average line contains six words.

Advertisements should be delivered, addressed to the Manager, at the Office, not later than noon on the Wednesday preceding publication; and if not paid for at the time, should be accompanied by a reference.

Post-Office Orders should be made payable to the British Medical Association at the General Post-Office, London. Small amounts may be paid in postage-stamps.

N.B.—It is against the rules of the Post Office to receive letters at *Postes Inconnues* addressed either in initials or numbers.

ADDRESS IN PHYSIOLOGY

BY

EDWARD A. SCHÄFER, F.R.S.

Jodrell Professor of Physiology in University College, London.

At the Annual Meeting of the British Medical Association at London, July-August, 1896.

ON INTERNAL SECRETION.

I propose to invite you to-day to consider a definite subject in physiology—the subject of internal secretion—one of far-reaching interest, although its full importance has only lately come to be recognised. A secreting organ separates certain materials from the blood, and pours them out again—usually after effecting a change of some sort in them—upon external surfaces, or at least upon surfaces which are connected with the exterior. These form the secretions which are most commonly known under that name. On the other hand, some secreted materials are not poured out upon an external surface at all, but are returned to the blood. These may be termed internal secretions, and they may be and are of no less importance than the better known and more fully studied ordinary or external secretions. The name of gland is the one which is usually applied to a secreting organ; and to those which furnish only internal secretions the name “ductless gland” has been applied. It is not, however, the ductless glands alone which possess the property of furnishing internal secretions. Every part of the body does, in fact, take up materials from the blood, and does transform these into other materials. Having thus transformed them they are ultimately returned into the circulating fluid, and in that sense every tissue and organ of the body furnishes an internal secretion. Moreover, certain important glands which are provided with ducts possess not only the faculty of yielding an external secretion, but have equally important, if not even more important, functions in connection with internal secretion. Thus both the liver and the pancreas are more essential to life, by virtue of the internal secretions which they furnish to the blood, than by their better known external secretions. The evidence of this is complete. The entire removal of either of these organs causes death, and this is due to the removal of the influence which they exert on the metabolism of the body by the loss of their internal secretions, not to the cutting off of their external secretions. For in the case of the liver it is well known that the bile may be diverted by a fistulous opening without any serious interference with the vital functions; and the same is the case for pancreatic juice. The kidney is another instance. It might, indeed, at first appear that a similar statement will not apply so well here; but it has been rendered evident by the researches of Dr. Rose Bradford that the kidney is not a real exception to the rule laid down, for enough of the kidney substance may be left to carry off the excretory products of the body, and yet the removal of the remainder of the organ may cause such disorganisation of the nitrogenous metabolism of the body as to lead speedily to wasting and death.

The same result is not obtained with all glands. The salivary glands may be entirely removed without any marked symptom supervening. And this is also well known to be the case with the mammary glands. On the other hand, removal of the generative glands leads to marked alterations in the development of other parts of the body. In the last-mentioned case the changes are probably produced through the nervous system, and are not connected with the internal secretion of the glands; and with respect to the salivary and mammary glands, we may assume that although they yield an internal secretion of some sort to the blood, it is of the same nature as that yielded by other organs, and that such other organs may act vicariously for those removed. This is, however, inapplicable to the liver, the kidney, or the pancreas; removal of which or restriction of their internal secretions is inevitably followed by a fatal result.

I do not propose to dwell further upon the internal secretions of the liver and kidney, and for contrary reasons—namely, that in the one case the subject has become too large for the limits of a short address; and in the other,

because the subject is one with regard to which we have at present too little information. But before leaving the liver I would point out that it affords an excellent illustration of the fact that internal secretions may, like ordinary or external secretions, either serve some useful purposes in the body (secretions proper) or may be formed only to be got rid of (excretions). The formation of sugar is an example of a useful internal secretion; that of urea of what would be termed in the ordinary sense an excretion, although urea is not actually got rid of by the liver, but is produced by that organ to be got rid of by the kidney.

The internal secretion of the pancreas may detain us somewhat longer. Among the mucous-secreting glands the pancreas offers a peculiarity of structure which in the first instance it may be well to note. For we meet here, besides the secreting alveoli and ducts, a peculiar epithelium-like tissue which occurs in isolated patches throughout the organ and which is characterised by its extreme vascularity. These islands of epithelioid tissue are quite characteristic of the pancreas. We know of no other externally-secreting gland which contains them.

Now it was formerly believed that the sole function of the pancreas was to yield pancreatic juice, and this, it must be confessed, is in itself a sufficiently important function, seeing that this fluid contains ferments which act on all the principal organic constituents of the food. It had indeed been remarked that cases of glycosuria occurring in the human subject were frequently associated with disease of some kind of the pancreas. Frerichs found that 20 per cent. of the total number of cases of diabetes which came under his notice were accompanied by obvious changes in the pancreas. Rokitsansky found in 13 out of 30 cases that the pancreas “was strikingly small, hard and bloodless; and in many cases it has been found so shrunken and atrophied as to be hardly recognisable save by its connections” (Silver). Claude Bernard had attempted as long ago as 1855 to entirely remove the pancreas, but all his attempts were unsuccessful, in so far that the animals speedily succumbed. In 1889, however, the operation was successfully performed by von Mering and Minkowski. They found that in all cases in which the entire pancreas was removed the operation was followed within the space of a very few hours by the appearance of sugar in the urine, and this to a great extent—as much as 5 to 10 per cent. being found even in fasting animals.

Accompanying the condition of glycosuria there is also produced polyuria; and these conditions occur even under a purely flesh diet, and are accompanied, as might be supposed, by rapid wasting, and followed within the space of 15 days or less by death. This result is not due to the loss of the pancreatic secretion, for, as we have already seen, the pancreatic juice may be diverted by a fistula, and the animal may remain in perfect health. Nor is it due to the loss of the secreting structure; for it has been found possible to destroy the secreting structure of the organ without the supervention of diabetes. This was done successfully by Schiff in 1873. Schiff's method, which was a repetition of experiments by Bernard, was the injection of paraffin into the duct of Wirsung. In Bernard's original experiments all the dogs operated upon speedily died; but this was probably due to accidental causes and not to the actual destruction of the pancreatic tissue, for in Schiff's experiments the dogs survived, and remained in perfect health. The fact that removal of the pancreas is followed by glycosuria was not at that time known, and the appearance of sugar in the urine was not therefore looked for by Schiff. But there can be no doubt of the absence of any severe form of diabetes, because the animals underwent no wasting.

Recently the experiment has been repeated by Hédou and by Thirioleix. Thirioleix found that, although the gland was reduced by the process of atrophy supervening on the injection to a mere rudiment, symptoms of diabetes do not occur as when the whole gland is removed. It is well known that if a portion of the pancreas be left—about one-quarter or rather more—no glycosuria appears. In the great majority of these cases the animals remain healthy, so that it is clear that a portion only of the gland can prevent the diabetic symptoms. Nor need the portion of gland which is left remain in its ordinary situation. A fragment of the gland either from the same or from another animal may, in fact, be

grafted elsewhere into the peritoneal cavity or under the skin. Provided the grafting be successful, and the portion of the gland employed of sufficient size, removal of the pancreas is now no longer followed by the usual symptoms. The animal may remain, in fact, in perfect health. But if at any subsequent time the grafted portion of pancreas is removed, diabetes supervenes, and the animal dies within a short time, as after a primary removal. Now it has been shown by Thirioix that the grafting of a portion of pancreas, the secreting part of which had been destroyed by injection of paraffin along the ducts, is also efficacious in preventing the advent of diabetes after removal of the pancreas. We must therefore assume that the material, whatever it may be, which is furnished by the pancreas to the blood, and which prevents excessive formation of sugar in the blood and in the urine, must be formed by some other constituents of the gland than the secreting cells; for there is every reason to believe that these cells are eventually completely destroyed after the ducts have been blocked in the manner described.

I am not aware whether the gland which has been thus caused to atrophy still shows the interstitial vascular epithelium-like tissue to which I have directed your attention; but it is extremely probable, in fact almost certain, that this tissue does not participate in the atrophy of the secreting part of the gland, and it is therefore, I think, fair to assume that the pancreas mainly owes its function as an internally secreting organ, at least so far as regards the prevention of diabetes, to this tissue, which is apparently peculiar to it amongst secreting glands. Various theories have been put forward to account for the effect upon carbohydrate metabolism of removing the pancreas. It is, however, still entirely unknown how the pancreas does actually act. The effects of grafting which have just been described entirely negative the view that the result is due to interference with the ganglia and sympathetic nerves at the back of the abdomen, a supposition which was at one time brought forward to explain the diabetes resulting from removal. It has been stated by Valli that in dogs which have been rendered diabetic by removal of the pancreas, injection of pancreatic emulsion into the blood causes a disappearance of the diabetic symptoms, and many instances have been recorded of diabetes in man, which, it is stated, have been benefited by the exhibition by the mouth of raw pancreas. With regard, however, to these statements, it may be remarked that the danger of injecting emulsion of raw pancreas into the blood would be great, on account of the tendency which extracts of gland cells have to produce intravascular clotting; and, so far as the treatment by feeding with raw pancreas goes, it has been found by Sandmeyer that in dogs with pancreatic diabetes the excretion of sugar is not decreased, but increased, by giving raw pancreas with the food, even although this be of an entirely proteid nature. The only fact that appears certain in connection with the manner in which the pancreas prevents excessive production of sugar within the body is that this effect must be produced by the formation of some material secreted internally by the gland, and probably by the interstitial vascular islets, and that this internally secreted material profoundly modifies the carbohydrate metabolism of the tissues. That it does so by influencing hypothetical "angar centres" in the bulb, as has been conjectured by Chauveau and Kauffmann, is for various reasons improbable.

The next internal secretion which I propose to consider is that of the thyroid gland. The process of study is in one sense simpler in this case, since there is no external secretion. That the thyroid gland is a secreting gland no one who studies its structure and its mode of development can well doubt; except that it is unprovided in the adult state with a duct, it has all the features of structure of secreting glands. It is formed of alveoli which are lined by epithelial cells, and these cells have been observed to exhibit changes after treatment with pilocarpin in no way dissimilar to those changes which have been noticed under like circumstances in the cells of true secreting glands. Further, we can observe the secreted material within the vesicles of the thyroid, in the form of the substance known as "colloid."

The gland is extremely vascular and very richly provided

with nerves, and both blood vessels and nerves come into very close relationship with the secreting epithelium. The glandular structure of the thyroid is more obvious in young than in old animals, and as age advances, as has been shown by Haie White and others, the organ undergoes a gradual process of degeneration, so that in advanced age its normal glandular structure can only with difficulty be recognised. As long ago as 1856 Schiff showed that extirpation of the thyroid in dogs is invariably followed by a fatal result. This observation, important as it now seems, fell for many years into oblivion, and it was not until clinical observations had again pointed to the importance of the gland that Schiff's experiments were remembered. These observations may be said to have commenced with the discovery of the disease known as myxodema by Gull in 1874, although the connection of that disease with affections of the thyroid was first recognised by Ord in 1878—an observation which has since been abundantly confirmed. In 1882 J. and A. Reverdin described the symptoms following upon complete removal of the thyroid body for goitre, and they recognised these symptoms as identical with those of the disease which had been described under the name of myxodema; they accordingly termed the collection of symptoms "operative myxodema." The results of the Reverdins were speedily followed by those of Kocher, who described, in a large number of cases, similar symptoms as following entire removal of the thyroid in man. Kocher pointed out that the effects are most marked in young subjects, and that they may not occur at all or be little manifest as age advances. These observations of the Reverdins and Kocher led to a renewal of his former experiments by Schiff, who, in 1884, published the results of sixty thyroidectomies upon dogs, in all of which the result was speedily fatal, the operation being quickly followed by the supervention of symptoms—tremors, spasms, and convulsions—which seemed to point to a serious disarrangement in the nutrition of the central nervous system. Schiff also discovered the fact that the symptoms are prevented by a previous graft of a portion of the gland beneath the skin or into the peritoneal cavity.

The subject now became one of general interest, and was taken up actively by many experimenters. In this country Horsley, by employing monkeys—which survive the operation as a rule considerably longer than dogs—discovered that the myxodematous condition which is so characteristic of the removal of the thyroid in man is also produced in animals.

It was further found by Allard and by Ewald that no results are obtainable by thyroidectomy in birds, and most observers state that the same is the case with rodents and herbivora generally. The absence of the result in birds has never yet been satisfactorily explained; but various attempts have been made to explain the frequent absence of result in herbivora. It may be either that a portion of the gland has been left behind, or that there existed in the particular cases in question accessory thyroids and parathyroids separated from the main body, and not removed in the operation. This is the explanation which is given by Gley of the negative results which usually attend thyroidectomy in rabbits. Gley states that if in these animals care be taken to remove the accessory structures as well, the usual symptoms supervene. Whether this is a sufficient explanation of the lack of result obtained by other observers remains yet to be proved.

The symptoms which follow thyroidectomy are of two classes—nervous and metabolic, although we are not able to say that the nervous symptoms are not produced by metabolic changes in the tissues of the nervous system; nor is it certain that the metabolic changes in the tissues are not consequent on alterations in the nervous system. The most characteristic nervous symptoms are those which have been already mentioned—muscular tremors, passing gradually into spasms, and finally into convulsive attacks. These cease on section of the nerves passing to the muscles. They are, therefore, of central origin; indeed, it has been shown that the excitability of the cortex of the brain, and even of the lower centres, is materially modified in animals which have suffered thyroidectomy. The metabolic changes which occur are most obvious in the connective tissues, and especially in the integument. These tissues become oedematous, but the oedema is not of the ordinary character. The fluid contains a superabundance of

mucin; the integument swells, but at the same time the surface becomes dry, and there is a tendency to the shedding of hairs and of the superficial epithelium. This mucinous change is followed, if the animal remains alive for a sufficient time, by atrophic changes. The nervous affection which primarily results is usually accompanied by slight fever. Later on this passes off, and the temperature becomes reduced even to some degrees below the normal. These effects of thyroidectomy can be entirely prevented by thyroid grafts, and can be temporarily prevented either by injection of thyroid juice under the skin or even by taking thyroid juice or raw thyroid by the mouth. Dr. G. R. Murray has described the case of one monkey in which, in consequence of the removal of the thyroid, all the symptoms of myxedema had appeared, which was completely cured by repeated subcutaneous doses of thyroid juice. He does not, however, state how long the animal was kept under observation after treatment, and whether the cure was permanent. It is, indeed, scarcely probable that the subcutaneous injection or the taking by the mouth of thyroid juice would be followed by more than a temporary removal of the symptoms. The effects of grafts, however, are to all intents and purposes permanent, and it has been found, as in the case of the pancreas, that removal of the graft which has maintained the health of the animal after extirpation of its own thyroid is speedily followed—as with primary removal of the organ—by the usual symptoms of thyroidectomy.

Various theories have been advanced to account for the effects of removal of the gland. H. Munk holds, or until lately held, that the effects of removal are entirely due to interference with adjoining nervous structures in the neck. But this, as in the similar theory propounded to account for the effects of extirpation of the pancreas, is absolutely negated by the results of thyroid grafting. Besides this theory, which must, it seems to me, at once be dismissed, there are two others which may be regarded as disputing the ground between them. Of these the one may be called the theory of "autotoxication" and the other that of "internal secretion." The autotoxication theory assumes that there is a certain toxic substance which is constantly tending to accumulate in the blood, and which it is the duty of the thyroid gland to render innocuous and to remove. According to this, the function of the thyroid would be primarily excretory. This view is supposed to be supported by the statement that in animals which are dying after removal of the thyroid the blood is toxic for other animals, and especially for those which have already had the thyroid removed, although this operation may have been performed only a short time previously, and before the symptoms of thyroidectomy have had time to develop. It is not stated what the probable nature of this substance is, or by what tissues it may be formed. The "internal secretion" theory would explain the phenomena of extirpation as due to the absence of a secretion which is formed within the thyroid, and which is passed into the blood, possibly through the medium of the lymphatics: a secretion which is necessary for certain of the metabolic processes within the body, and especially for those connected with the nutrition of the central nervous system and of the connective tissues. For in the first place, beneficial and not toxic effects follow the exhibition of thyroid juice both in cases of thyroidectomy in animals and in myxedema and other affections in man. And secondly if we investigate the physiological effects of extract of thyroid gland whether prepared with water or glycerine, and whether previously boiled or not, we find that it produces a distinct action upon the blood vessels, so that the blood pressure markedly falls (Fig. 1), although the beats of the heart remain at about the same rate and of the same strength. This lowering of the blood pressure without influencing the action of the heart can only be produced in one way, namely, by increasing the calibre of the arteries. Before this effect upon the blood pressure was discovered by us, it had been shown by my co-worker, Dr. George Oliver, that the exhibition of thyroid juice or other preparations of

¹ Munk has enunciated a theory which deserves consideration here, to the effect that removal of the thyroid produces an interference with the full chemical development of the constituents of the connective tissues, so that these tend to take on an embryonic character, and it is well known that excess of mucin is characteristic of embryonic connective tissues.

Fig. 1. Effect in the dog upon the blood pressure of intravenous injection of decoction of thyroid. Time in seconds; some are imperfectly marked. The line above is the abscissa of blood pressure.

thyroid in the human subject has a tendency to increase the calibre of the radial artery. It would seem, therefore, that the juice of the thyroid and extracts which are obtained from the gland have a distinct action upon the vascular system. In connection with this it is of interest to recall the observations of Lorrain Smith upon the effects of thyroidectomy in altering the gaseous exchanges within the tissues of animals. Lorrain Smith found that in animals which have been deprived of the thyroid body the reaction to changes of temperature was abnormally rapid. When normal animals are exposed to a cold atmosphere the production of carbonic acid becomes increased consistently with the increased oxidation which is necessary to cause an increased production of heat, but this increase of carbonic acid does not take place immediately, but only comes on after a certain period of time, the temperature of the body being in the meantime maintained normal by those physical changes which occur in the circulation, and which allow the quantity of blood brought to the skin, and the amount of heat thereby lost from the general surface of the body to be varied. Now it is precisely these vasomotor changes which appear to be lacking after removal of the thyroid; for the production of carbonic acid becomes almost immediately increased by exposing thyroidectomized animals to a low temperature. That the thyroid gland yields an internal secretion which effects a useful purpose within the body appears to result conclusively from these facts, and the effects which follow thyroidectomy are probably due to the loss of that secretion. Whether the gland also possesses the function of destroying toxic pro-

ducts of metabolism which would otherwise tend to accumulate in the blood is a point which requires the production of more conclusive evidence before it can be regarded as established.

The next organ the internal secretion of which we may shortly consider is the pituitary body. It is well known that the anterior lobe of the pituitary body is a structure which may in general terms be described as glandular, and although not in all respects resembling the thyroid there are nevertheless certain points both in connection with its mode of development and in the structure of the fully formed organ which might lead to the supposition that there is something functionally common to the two organs. So far as destruction of the pituitary body is concerned, experiments have given interesting results. The organ has been removed successfully in a number of cases in cats by Marinesco and in dogs by Vassale and Sacchi. In all instances of complete removal death results: usually within a fortnight of the operation. The symptoms observed are (1) a diminution of the body temperature, (2) anorexia and lassitude, (3) muscular twitchings and tremors, developing later into spasms, (4) dyspnoea. Many of the symptoms show abatement after injection of pituitary extract. Vassale and Sacchi conclude that the pituitary must furnish an internal secretion which is useful in maintaining the nutrition of the nervous and muscular systems. Some of these symptoms, especially the muscular twitchings, are similar to those seen on removal of the thyroid. Moreover, it has been stated that after thyroidectomy the pituitary body becomes enlarged; and Rogowitch has supposed that the fact that in rabbits a thyroidectomy commonly fails to produce the usual results is due to the pituitary taking on a vicarious action, the pituitary being larger in proportion in the rabbit than in most animals.

Similar statements with regard to its enlargement have been made in cases of myxoedema in which the pituitary has been examined. But, on the other hand, Schönemann, who examined the pituitary in a large number of cases of goitre, got

no distinct evidence of its enlargement in that disease nor of any other marked change. And whereas enlargement and degeneration of the thyroid is accompanied by cretinism and myxoedema, there appears to be a close connection between enlargement and degeneration of the pituitary body and an entirely different disease first described by Marie, namely, acromegaly, the most obvious symptoms of which are hypertrophy of the bones of the extremities and of the face with some hypertrophy of the skin and mucous membranes, but without mucinoid degeneration. Moreover, the theory that the thyroid and pituitary may act vicariously appears to be entirely negated by the physiological effects which are produced by extract of the last-named gland. These effects are exemplified in tracings of the blood pressure and heart beats (Figs. 1 and 2), which show that, whereas thyroid extract produces no obvious effect upon the contractions of the heart, decoction of the pituitary body causes great augmentation in the force of the heart's beat without, however, any accompanying acceleration of the rate. Further, the effect upon the arteries is precisely the reverse of that which is obtained by extract of thyroid. The blood pressure rapidly rises, and that this rise is not due simply to augmentation of the heart's beats, but that it is also due to contraction of the arterioles, is sufficiently shown by the fact that if salt solution containing pituitary extract be passed through the blood vessels of a frog, the entire nervous system of which has been destroyed, the vessels markedly contract. This experiment conclusively shows that the effect upon the arteries is unquestionably a direct one, and in all probability this is the case also with the heart.

We may fairly suppose, then, that the pituitary body also furnishes to the blood an internal secretion, and it would appear that this internal secretion tends to increase the contraction of the heart and arteries, and to influence the nutrition of some of the tissues.

Lastly, we may proceed to consider the internal secretion of the suprarenal bodies. The immense importance of these glands in nutrition was indicated by Addison, who, in

Fig. 2.—Dog, 7 kilos., morphine, atropine. A, auricle; B, ventricle; C, blood pressure (femoral artery); D, zero-pressure and signal; E, time in seconds. Effect of intravenous injection of bolus of extract equivalent to 0.07 gramme dry pituitary (reduced to one-half).

1855, pointed out that the symptoms of the disease now known by his name are associated with pathological alterations of the suprarenal capsules. This observation was tested experimentally by Brown-Séquard, who found (in 1856) that removal of the suprarenal bodies was rapidly and unfailingly fatal in all animals. The symptoms following the removal are practically those of Addison's disease, although much more acute. There is extreme muscular weakness, and great loss of tone of the vascular system, with ultimately nervous symptoms, loss of appetite, and other signs of general prostration. But the pigmentation which usually accompanies disease of those organs was not noticed by Brown-Séquard, and he inferred that this absence of pigmentation was probably due to the fact that a fatal result appears so rapidly after the complete removal of the capsules in animals that time is not afforded for the development of this symptom. This conjecture appears to have been confirmed by an experiment of F. and S. Marino-Zucco, who state that by inoculating the suprarenals of rabbits with pseudo-tubercle bacillus they have succeeded in obtaining not only the slow development of the ordinary symptoms of suprarenal removal, but also an augmentation in the pigmentation of the skin and hair. The experiment, however, requires confirmation.

It is needless to state that Brown-Séquard's results, following as they did upon Addison's observations, attracted much attention, and numerous investigators set to work to verify them. But many of these failed to confirm the results which were obtained by Brown-Séquard, probably by reason of the removal being incomplete or of the existence of accessory capsules; and after a few months of controversy the subject gradually dropped, and became for a long time almost forgotten. The interest in this subject has been, however, recently revived, and the experiments of Brown-Séquard have been repeated by various observers, including Brown-Séquard himself, Abelson and Langlois, Tizzoni and many others. I have myself made several experiments of the same kind on various animals (monkeys, dogs, cats, and guinea-pigs). All these observations have tended to confirm the original statements of Brown-Séquard. They show that animals deprived of their suprarenal capsules die rapidly, usually in the course of two or three days with the symptoms above noted, and the further fact is mentioned by Abelson and Langlois, and this is also confirmatory of a statement of Brown-Séquard, that the blood of animals dying in consequence of the removal of the suprarenal capsules is toxic for other animals which have recently been deprived of their capsules, although it causes no toxic results in normal animals.²

The symptoms caused by this blood are said by Abelson and Langlois to be those of curare poisoning—paralysis, that is to say of the intramuscular nerve endings; and since the most marked phenomena resulting from removal of the capsules is extreme muscular weakness it has been concluded by them that after removal of these glands a certain toxic product of muscular metabolism accumulates in the blood, and that the function of the glands is to remove or destroy this toxic principle.

This is the "autotoxication" theory of the suprarenal capsules, and is similar to that which has been applied to the thyroid body. Like the other autotoxication theories it is chiefly founded upon the fact that the blood of animals which are moribund in consequence of the particular extirpation is toxic, especially for other animals which have been submitted to the operation. But is it not probable that the blood of an animal dying slowly as the result of any disease would be toxic to some extent, and that the toxic principle would more powerfully affect animals whose resisting power has been lessened by a recent severe operation? However this may be, whether the suprarenal capsules do or do not destroy a toxic principle which is formed elsewhere, and which

would otherwise accumulate in the blood, they unquestionably produce a material which has entirely different properties from those stated to be possessed by the blood of animals deprived of their capsules. This material, which is probably the basis of the internal secretion of the glands, has most active physiological properties, and it is to these that I will now direct your attention.

Experiments upon normal animals with extracts of suprarenal have been performed by a number of observers, but by all in a very incomplete manner. For the most part they have been satisfied to subcutaneously inject extracts made with water and other menstrua, and to observe the symptoms, if any, which result. As a matter of fact, in some animals which are so treated there are no obvious symptoms. The guinea-pig will stand a large subcutaneous dose of suprarenal extract without showing any symptoms at all, or with, perhaps, only a slight acceleration and increase of the force of the pulse. The same appears to be the case with the cat and with the dog, unless a very large dose be injected. Rabbits, on the other hand, are extremely susceptible to the influence of suprarenal extracts. If a large dose be given, the animal may succumb within half an hour. If on the other hand, the dose be only moderate in quantity, it may not show any symptoms at all for some hours, and then it may suddenly succumb. This primary absence of symptoms has been also noted by Foh and Pellacani in dogs, who state that in many of the animals which they experimented upon in this way there were no symptoms at all apparent upon the day upon which the injection was given, but that the next morning the animal was usually found dead.

The cause of death, it may be added, in this case is not by any means clear. Foh and Pellacani have supposed that it may be due to paralysis of the respiratory centre, but the slight effect which intravenous injection of suprarenal extract produces upon this centre does not lend support to this conjecture.

The physiological effects of intravenous injection of suprarenal extract are far more striking. The facts which I am about to put before you are new; they are the result of experiments by Dr. George Oliver and myself, performed during the last two years.³ They show conclusively that the medulla of the suprarenal capsule contains a dialysable organic principle, soluble in water, and not destroyed by boiling for a short time, which produces a powerful physiological action upon the muscular system in general, but especially upon the skeletal muscles, the muscular walls of the blood vessels, and the muscular wall of the heart. A certain amount of action is also manifested upon some of the nerve centres in the bulb, especially the cardio-inhibitory centre, and to a small extent upon the respiratory centre.

The effect upon the skeletal muscles is well shown in the frog (Fig. 3), and can also be seen in mammals. The contraction

Fig. 3.—Effect of suprarenal extract upon muscle contraction in the frog. A. Normal muscle curve of gastrocnemius. B. Curve taken during suprarenal poisoning, but otherwise under the same conditions as A. Time is ———.

² The chemical work in connection with these experiments has been carried out by Mr. H. Moore.

³ Figs. 2, 4, 5, 6, and 7 are taken from the *Journal of Physiology*, vol. LVIII, No. 3, 1895.

¹ It is stated by Brown-Séquard that injection of extract of suprarenal under the skin of animals, the suprarenal capsules of which have been removed, has a partial success in prolonging life. I myself know of no cases in which animals in this condition have been kept alive for any length of time, either by injection in this way or by the taking of suprarenal by the mouth. Nor am I aware of any successful attempts which have as yet been made to effect a graft of the organ into another place, although there can, I imagine, be little doubt that if such a graft were to become successfully rooted, the result would be similar to that which is got with grafts of pancreas and of thyroid. It appears, moreover, to be true that some cases of Addison's disease are distinctly benefited by extract of suprarenal capsule, taken by the mouth.

Fig. 4.—Dog of 9 kilos; morphine; artificial respiration; one vagus only cut. Intravenous injection of 0.2 g. dog suprarenal. A, ventricle; N, auricle; C, femoral; D, abscissa of blood pressure; M, time, 0.5". (Reduced to one-half.)

Fig. 5.—Dog of 9 kilos; morphine; artificial respiration; vagi cut. A, ventricle; N, auricle; C, carotid pressure; D, abscissa and signal; M, time, 0.5". Effect of intravenous injection of extract of about 0.2 g. suprarenal. (Reduced to one-half.)

of the muscle in response to a single excitation of its nerve is as ready as in the normal animal; but it is greatly prolonged, so that the result is comparable to that produced by a small dose of veratrin, which, as is well known, has the effect of enormously increasing the contraction resulting from a single stimulation of the muscle or its nerve. It is in no way com-

parable to a curare effect, for the muscles remain as excitable through their nerves as before. It is therefore an effect entirely different from the so-called autotoxigenic paralysis which is stated to result after removal of the suprarenal capsules in animals, and the material which is extracted by water, therefore, from the suprarenal capsules is certainly

not the same material that is said to accumulate in the blood after the removal of these organs.

The action upon the circulatory system may be divided into the action upon the heart and the action upon the arterial system. Upon the heart the effect differs according as the vagi are cut or uncut. When the vagi are uncut, and the heart is therefore still in connection with the cardio-inhibitory centre in the medulla oblongata, the action of suprarenal extract is to slow and even to entirely stop the contraction of the auricle. Under these circumstances the ventricle continues beating with an independent slow rhythm (Fig. 4). The result is to cause the pulse to be very slow. On the other hand, when the vagi are cut or their cardiac ends paralyzed by atropine, the effect upon the heart is precisely the reverse. The strength and frequency of the auricular contractions are markedly increased, and those of the ventricle are correspondingly augmented. This naturally has the effect of sending a vastly greater amount of blood into the arteries, which by itself would alone produce a great rise in the arterial pressure. The direct action upon the arteries is, however, quite as marked as that upon the heart. If the blood pressure be taken in a dog in the usual way by connecting a mercurial manometer with the femoral artery, and if a minute dose of suprarenal extract be now injected into a vein it is found that even with the vagi uncut and the heart therefore slowed by the action of the extract the blood pressure rises considerably (Fig. 4). But with the vagi cut or paralyzed by atropine the rise can only be characterized as enormous (Fig. 5).

The contraction of the arteries is further exemplified by the fact that if an organ such as a limb or the kidney or the spleen be enclosed within a plethysmograph, or oncometer, the instrument indicates an enormous diminution in volume of the organ, which can only be accounted for by a contraction of its arterioles.⁴ This contraction is produced by the direct action of the drug upon the muscular tissue of the smaller arteries

and not indirectly through the vasomotor centre, for it obtains in the mammal equally well with the spinal cord cut or the bulb destroyed (Fig. 6), or even in the case of the arm after the brachial plexus has been severed (Fig. 7). In the frog it is produced also with the brain and spinal cord completely destroyed and salt solution containing suprarenal extract allowed to flow through the arteries.

Under these circumstances the flow of fluid, which without the suprarenal extract may have been comparatively rapid, becomes almost completely stopped, and this can only be due to the direct action of the extractive substance upon the muscular tissue of the smaller arteries. The enormous rise of blood pressure which is met after the vagi have been cut is shown in the tracings. The pressure may rise to four or five times its original height; I know, in fact, of no other agent which will produce such an enormous increase of pressure except direct stimulation of the vasomotor centre. It is not the case, however, that this centre is stimulated by the drug, as has been erroneously supposed by Cybulsky, for, as we have seen, the action is essentially a peripheral one.

The effect passes off in the course of a few minutes. After a dose, no matter whether small or large, has been injected into a vein, and has produced the results which we have seen, the blood vessels slowly resume their ordinary calibre, the augmentation and increased frequency of the heart's beats become gradually lessened, and the blood pressure recovers its normal condition. Whilst the pressure is raised under the action of suprarenal extract, there is apparently no possibility of inhibiting the arterial contraction; even the strongest stimulation of the depressor nerve, which under ordinary circumstances produces through the vasomotor centre a marked dilatation of the arterioles, is without result during the activity of this extract. The question naturally arises, How is it that the effect so soon disappears? In what manner is the active principle eliminated? It is not eliminated by the kidneys, for the effect passes off just as quickly, even

although the renal arteries are clamped. It is not eliminated by the suprarenals themselves, for the same fact holds good for the suprarenals. It passes off almost equally quickly if the aorta and vena cava are tied in the upper part of the abdomen, so that there is no circulation of blood whatever in the abdominal organs. It is not excreted or otherwise destroyed by the blood, for it retains its full potency even after it has been twenty-four hours in contact with that fluid. The most probable explanation of the disappearance of the effect seems to be that the active principle becomes packed away, and eventually rendered innocuous in certain organs. That the muscles take most part in this storage is probable from the fact that the physiological effects upon the skeletal muscles are manifested for a long time after the effects upon the heart and arteries have disappeared.

One of the most interesting and important facts regarding the material which is yielded by the suprarenals is the minuteness of the dose which is necessary to produce these results. As little as 0.0005 g. (5/100,000 of a gramme) of dried suprarenal is sufficient to obtain a maximal effect upon the heart and arteries in a dog weighing 10 kilograms. For each kilogramme of body weight, therefore, all that is necessary to produce a maximal effect is 0.0005 g., or little more than half a milligramme.

Now we have shown that the active principle is contained only in the medulla of the gland, not in the cortex, and the medulla in all probability does not form more than one-fourth of the capsule by weight. Of the dried medulla certainly not less than nine-tenths is composed of protein and other material which

Fig. 6.—Effect of suprarenal extract upon heart, limb, spleen, and blood pressure after section of cord. The forearm in this experiment was at first passively suspended but its contraction is afterwards manifest. (Reduced to one-half.)

⁴ In man the effect of taking suprarenal extract by the mouth is to produce a general constriction in calibre of the arteries as measured by the arteriometer (Hoyer).

Fig. 7.—Dog of 20 kilos; morphine, enure; vagi cut; artificial respiration. A, time 0.5'; B, plethysmographic tracing of right forearm (brachial plexus cut); C, blood pressure in femoral; D, abscissa of blood pressure and signal of injection. Effect of intravenous injection of extract of 0.2 g. calf suprarenal. (Reduced to one-half.)

is not dialysable, and which otherwise does not conform to the chemical properties which have been ascertained to belong to the active substance of the gland. So that, if we take these facts into consideration, we find that in order to produce a maximal effect a dose of not more than fourteen-millionths of a gramme per kilogramme of body weight is all that is necessary. Now it is certainly true to say that one-fourteenth of this dose will produce some effect, although not perhaps a very large one. We thus arrive at the astounding conclusion that the active principle of the suprarenal capsules, taken in the proportion of not more than one-millionth part of a gramme per kilogramme of body weight, which would be equivalent to $\frac{1}{75150}$ g., or less than $\frac{1}{100}$ grain, for an adult man, is still sufficient to produce distinct physiological results upon the heart and arteries.

It may be considered probable that the suprarenal capsules are continually secreting into the blood this active material which, although present in that fluid only in minute quantities, may yet be sufficient to produce an effect which is beneficial for the performance of the functions of muscular tissue, and especially the muscular tissue of the vascular system. It has, in fact, been stated by Cybulsky that the blood of the suprarenal vein contains a sufficient amount of the active principle of suprarenal extract to produce marked physiological effects. I have made three very careful experiments in an endeavour to confirm this statement, but I have not been able to find that the blood of the suprarenal vein does actually contain a sufficient amount of this material to produce, even in doses of as much as 10 c.cm., any more result than venous blood generally. But whether we are able to show it experimentally or not, there is, I suppose, very little doubt of the fact that the materials formed pass somehow or other into the blood; and, when we compare the results of suprarenal injection with the converse effects obtained from the removal of suprarenals and from disease of those organs, we can come to no other conclusion than that we have before us a notable instance of internal secretion.

The general results to which we are led from a consideration of these facts point very strongly in favour of the notion that internal secretions are yielded both by the ductless glands and by what are usually known as the true secreting glands, and that such internal secretions may be of no less importance than the better recognised functions of the external secreting glands. That failure of one or other of these internal secretions may occasionally have to be reckoned with by the physician there can be no doubt, while on the

other hand the therapist will be able to avail himself of the active principles which the internally secreting organs afford, and in certain cases to use their extracts in place of the hitherto more commonly employed vegetable medicaments.

That the subject has a vast future there can be little hesitation in predicting, for, in spite of the advances which have been made in elucidating it during the last few years, very many points still remain obscure. Nevertheless, the way which the physiologist has attempted to show may now safely be followed by the practitioner, and the results of these physiological experiments as well as clinical and pathological observations in the same direction which are steadily accumulating, cannot fail to throw light upon and to assist in the diagnosis and treatment of many ill-understood symptoms of disease.*

* Most of the experiments with gland extracts which are referred to in this address have been made in conjunction with Dr. George Oliver, and are published in detail in the current number of the *Journal of Physiology*.

WHITE RACES IN TROPICAL AFRICA.—At the meeting of the Geographical Congress on Wednesday, July 31st, Sir John Kirk read a paper, prepared by Captain Lugard and himself, on the Suitability of Tropical Africa for Development by White Races, or under their Superintendence. He assumed, in common with all who spoke afterwards, that the time has come for Europe to open up the continent of Africa; stated that though we know much about its interior, we lack precise information about its climate; and elaborated the conditions necessary for successful European colonisation. Climate is a most important consideration, and all maritime zones and districts below 5 000 feet elevation must be dismissed as useless. Yet there are districts in tropical Africa in which climate alone will not interfere with European colonisation. In his treatment of such matters as malaria and fever, the speaker said that canoe voyages along rivers are especially dangerous to health, but steamers and railways will give rapid access to the healthy areas. It was made clear that the localities which fulfil the favourable condition of colonisation are few. West Africa is out of the question, with the possible exception of German South West Africa, which lacks harbours, and its development will never precede the better areas of the same latitude in East Africa.

The French Hospital and Dispensary, Shaftesbury Avenue, has received from M. Robert Lebaudy £1,000 as part of the prize won lately by his horse *Styrax* at Auteuil.

BRITISH MEDICAL ASSOCIATION. ANNUAL MEETING, LONDON, 1895.

PROCEEDINGS OF SECTIONS.

SECTION OF ANATOMY AND HISTOLOGY.

HENRY MORRIS, F.R.C.S., President.

A DISCUSSION ON ART IN ITS RELATION TO ANATOMY.

OPENED BY WILLIAM ANDERSON, F.R.C.S.,

Professor of Anatomy in the Royal Academy of Arts, Joint Lecturer
on Anatomy at St. Thomas's Hospital.

THE object of the paper I have the honour to read to-day is mainly demonstrative and only in a minor degree argumentative. The three considerations I propose to lay before the Section are, first, the Debt that Anatomy owes to Art; secondly, the Advantages that Artists may derive from a Scientific Knowledge of Anatomy; and, lastly, the Extent to which Artistic Methods of Observation may Profit Ourselves in the Medical Study of Anatomy.

1. The consideration of the debt that anatomy owes to art will occupy the greater part of the time at our disposal, for I shall venture to give a brief history of the rise of artistic illustration in its application to anatomical teaching, in order to bring under the notice of those of our body who have had no leisure to devote to the subject a collection of illustrated anatomical treatises from the time of Berengario da Carpi to the present day, and to say a few words concerning the evidences of anatomical observation by artists in the period antecedent to what we should now term "anatomical illustration."

EARLY ANATOMY AND EARLY ART.

Anatomical knowledge of a certain kind is as old as art itself, but the early knowledge was vitiated by imperfect observation and blind reverence for misleading traditions. Anatomical illustration, too, was employed wherever the name of anatomy was held in respect, as in Egypt, in Greece, in India, and even in China; and models, showing more or less inaccurately the relative positions of the heart and lungs and other large organs, were used for purposes of demonstration by orthodoxy and quackery alike. These crude efforts, however, may be passed over, for it is not to mere caricatures of visceral anatomy that we must turn for examples of art, but to something that was pure art without scientific aim, art that showed in the highest degree two of the qualities upon which scientific progress must depend, accurate observation, and exact record of the thing observed.

The history of art and that of anatomy are by no means contemporary. While the art of the sculptor was producing its grandest masterpieces, medicine remained mystical, empirical, and, perhaps worst of all, dogmatic; and anatomy, the basis of all true medical science, was, even for a mind like that of Hippocrates, a collection of imperfectly-noted facts tempered with time-honoured fictions. In the midst of all the medical darkness, it was the artist alone who found light to study the anatomy of man. More than a century before the school of Alexandria had, under Herophilus and Erasistratus, inaugurated the study of human anatomy by dissection, the dissection, it is said, not only of the dead subject but even of living men. Pheidias, the great master of the age of Pericles, and a contemporary of Hippocrates himself, had achieved what appears to us now the very consummation of truth and beauty in the representation of the human figure.

THE GREEK SCULPTOR AS ANATOMIST.

Let us look at the noble figures of the Theseus and of the Hyasus (to take the most familiar of the many names given to the masterpieces of the Parthenon), and we shall see a very triumph of truth, expressed with ineffable nobility by the mind and hand of genius. It is not enough

to merely represent Nature as we may chance to find her in any given subject. Nature is full of imperfections, but all that is beautiful is there for him who has the eye to distinguish perfection in the midst of faults, and the skill to record it in such a way as to teach the rest of the world. This is what Pheidias did, what some of his predecessors and contemporaries aimed at, and what Michael Angelo with all his power and all his science failed to do.

Let the most profound anatomist of our day examine these magnificent fragments and try to discover an error in science, or let the greatest artist try to point out a line or a contour that could be altered without loss, if he can. Here is an anatomy, not studied in the dissecting-room, as was that of Michael Angelo, but instinct with life and as free from omission as from error. There is no impressionistic scamping here; every touch is workmanlike and thorough, but it is from the hand of a workman who knew that all dignity and beauty lay in Nature, and who found them. No photograph of the finest living model could give us what we see here, for no model is perfect; but the artist has created grand types by virtue of a wide and discriminating research of Nature—by what may be termed "artistic selection" in opposition to "natural selection." The Discobolus of Myron, which preceded the Theseus and Hyasus, is almost as accurate in anatomical forms but infinitely inferior in genius, for it is realism without soul. The same may be said of a higher work, the Borghese warrior (Fighting Gladiator) of Agasias (400 B.C.), which is the very idealisation of animal strength in action, and the Farnese Hercules, which shows the huge brawn of the athlete in repose. But a more difficult task has been achieved by the sculptor, probably Cresilas, a contemporary of Pheidias, who has caught the last effort of the fainting or dying man in the figure commonly known as the "Dying Gladiator." In all of these, and in many others that might be named, art was wedded to Nature; but later on two meretricious rivals, convention and drama, were admitted into the atelier, and the decadence of art began. Take the vaunted group of the Laocoön, attributed to the Rhodian sculptors, Agesandros and his two sons, in the first or second century A.D. Grand and beautiful as it is, its perfection is marred by dramatic posing, faults of observation, and artificial laws of composition. Again, the figure of the standing Discobolus, attributed to Naudides—which for our aesthetic sins is made a canon in nearly all our art schools—is full of weak conventions and faults of form, redeemed only by a certain nobility of pose and grace of action that hint at what the artist might have done had he followed the teachings of the great Nature that was at his doors.

THE DECADENCE.

The establishment of the school of Alexandria less than a century after the death of Pheidias, should have done much to advance the knowledge of anatomy, and we know that under Erasistratus and Herophilus the dissection of the dead body was practised openly, but there was marvellously little harvest from such a broad and fertile field, and the culture of original observation in human anatomy rapidly declined, until in the second century of our era, when Galen, strongly imbued as he was with the spirit of research, was compelled to base his anatomical writings on the dissection of the lower animals, and taught nothing that could serve the cause of art. And down to the seventh century, although the Greek surgeons in Asia Minor had done something for surgery, anatomy remained at a standstill. Even the works of Galen were neglected from the end of the fifth century, and we come to that most dismal of all periods—the Middle Ages—when art was at its lowest ebb, when learning, represented chiefly by Jews and Arabs and a bigoted clergy, was opposed alike to scientific investigation and artistic culture. The magnificent torseutic art of Greece and its pale reflex in Rome dwindled away through the Byzantine period to be revived only with the advent of Cimabue and Giotto. In all this long and dreary period there was scarcely a ray of light, artistic or anatomical, and it was not until the thirteenth century that Frederick, the second Emperor of Germany, and King of the Two Sicilies, revived the study of anatomy by dissection. The first outcome of the new departure was the publication in 1316 of the first treatise on human anatomy, that of Mondino, better known by his Latinised name Mundinus.

THE REVIVAL OF ANATOMY.

Dissection was introduced into France at Montpellier in 1376, and it was by a French surgeon, Henri de Mondeville, who lived at the beginning of the fourteenth century, that anatomical diagrams were first used in Europe as a means of instruction. The drawings were probably traditional, and dealt only with anatomy from the Galenic standpoint, for Guy de Chauliac, the pupil of de Mondeville, who records their use, knew only the antique lore handed down by the Arab writers.

It was not, however, till the latter part of the fifteenth century that the initial stage of the anatomical revival was past, and then for the first time in history art and scientific anatomy went hand in hand. From this time we may formulate four periods of art in its relation to anatomy:—

1. The period of early association between artists and anatomists anterior to the publication of illustrated anatomical treatises: from the early part of the fifteenth century.

2. A period of accurate and artistic illustration of anatomy by wood engraving, covering the second quarter of the sixteenth century.

3. A period of artistic illustration by engravings in copper, terminating in the second decade of the present century.

4. The modern period of multiplied technical resources in reproduction, with painstaking efforts to secure clearness of representation.

THE EARLY ASSOCIATION OF ARTISTS AND ANATOMISTS.

The first really important application of art to medicine belongs to a period no earlier than the fifteenth century, and brings us into contact with one of the most versatile figures in history—Leonardo da Vinci, painter, sculptor, architect, scientist, poet, and musician. It was he who, first amongst artists, judged it profitable to place himself *en rapport* with the representatives of medical science. It is known that he became intimately associated with the physician Marcantonio della Torre, of Ferrara and Padua, and that he made for him numerous drawings to illustrate an anatomical treatise, but the untimely death of Marcantonio in 1496 or 1512 dissolved a connection which under better auspices might have raised the anatomist to the eminence afterwards occupied by Vesalius. As it was, the great work remained unfinished, all that had been written was lost, and with it disappeared the drawings of Leonardo. Nearly all that we now possess of the anatomical work of the painter is a small series of representations of the bones and muscles, but these, if not

artist is said to have written a special treatise, another lost treasure. It may be worth while to call attention to a curious outline forming suite with these, a vertical section of two figures in the act of sexual congress. The aim of the sketch was purely physiological, and the chief interest of the drawing lies in the fact that, unlike in the companion pictures, which were undoubtedly taken from actual dissections, the structural features were derived from the Galenic descriptions—a fault compromising to the reputation of Marcantonio, if he is to be held responsible for the scientific errors of his pupil or associate.

The period of Leonardo and of the succeeding generation was a glorious one in the history of art, for while the great Tuscan was yet in the vigour of his age, a reflex of his many-sided genius appeared in Michael Angelo Buonarroti, at once painter, sculptor, architect, engineer, and poet. The younger man had reached the zenith of his fame when his predecessor, full of years and honours, expired in the arms of the monarch whose graceful tribute to genius did more to immortalise his royal memory than the Field of the Cloth of Gold or all the prodigal magnificence of a long unlucky reign.

Michael Angelo, like Leonardo, perceived at once the advantages to be derived from the association of art with anatomy. Realdo Colombo became his Marcantonio; and for twelve years, first in Florence, then in Rome, he devoted himself to the study of the human body. The results are manifest, and perhaps too plainly, in all his works. His statues of David, the Captives, and many others, are wonderful evidence of anatomical knowledge, though often defective in proportion and too suggestive of the dissecting room, but the sculptor and painter gave nothing to medical science. The work of his friend Colombo appeared in 1539, without a single illustration beyond a woodcut frontispiece of a dissecting-room scene, and there is no record of any drawings by Michael Angelo like those which Leonardo is said to have executed for Marcantonio.

The third great star of the Renaissance, Rafaelo Santi, again painter, sculptor, and architect, won triumphs as enduring as those which fell to the lot of his rival and contemporary, but they were of a somewhat different nature. He was, perhaps, less an anatomist than either Leonardo or Michael Angelo, but fewer years were allotted to him for the consummation of his studies, for he passed away before he had ended the fourth decade of his brilliant career. It is nevertheless proved by some of his sketches not only that he comprehended the importance of the science, but that he was no mean proficient in those portions of it which are most essential to the painter.

To this constellation may be added the names of Pollajuolo, Baccio Bandinelli, Rosso de' Rossi, and Benvenuto Cellini. Of the first two we know little, except that they practised dissection, and some repulsively realistic anatomical sketches by Bandinelli have been preserved. Rosso de' Rossi, a late contemporary of Rafael, was the first artist who attempted to prepare a volume upon anatomy for the use of painters, but unfortunately he did not live to carry out his design. The one plate, containing representations of the bones and muscles, given to the world as an earnest of his good intentions, is, however, so rich in strength and fidelity that it has been mistaken for the work of Michael Angelo himself. Benvenuto Cellini attached himself to Guido Guidi (Vidius Vidius), whose book on anatomy was not published till long after his death, and to Bèrengario da Carpi, but it is uncertain whether he gave any assistance to either author.

So far the art of the fifteenth and the first half of the sixteenth centuries bore little relation to medicine, if we omit from consideration the drawings said to have been made by Leonardo. Whilst great painters left accurate record of all that their dissecting-room experiences had revealed, two of the most celebrated physicians of the age, Magnus Hundt, of Leipzig, and Lorenz Phryssen, of Colmar, found nothing better to illustrate their treatises than the anatomy of Galen. Phryssen, in a pretentious tome entitled *Spiegel der Artzney* (1518) gives us only a wretched caricature of the skeleton, a view of the abdominal and thoracic viscera that was probably a reminiscence of some half-hearted necropsy of a dog, one or two confused sketches of the brain, and a carefully executed picture of the august teacher seated in academic

Fig. 1.—From sketches by Leonardo da Vinci.

scrupulously exact, yet stand unrivalled in vigour and expressiveness, and the scientific spirit of the design is manifested by the addition of analytical diagrams framed for the demonstration of muscular action—a subject on which the

dignity before a meek disciple, who cringes bareheaded to receive with unfathomable faith and patience the stultent pedantry enunciated from the magisterial chair.

ILLUSTRATION OF ANATOMICAL BOOKS BY WOOD ENGRAVING.

The second period, that of artistic illustration of anatomical, medical, and surgical works by wood engravings, began in the third decade of the sixteenth century with the appearance of a commentary upon the anatomical works of Mondino by Berengario da Carpi (1521), which was followed in the next year by a compendium by the latter author, who therein corrected many errors of his predecessor, and added much new material. Both of these books were embellished with woodcuts, a few of which, chiefly myological, were of much artistic beauty and moderate accuracy, while others were of a traditional character, and in accordance with the description of Galen and the Arab school. It is possible that Berengario received some artistic aid from Benvenuto Cellini, then in his early manhood. Nearly twenty years later further contributions of a very similar kind were made by Johann Eichmann or Dryander, a professor at Marburg, who issued an original composition upon the dissection of the body in 1537, with wood engravings not unlike those of Berengario; and in 1541 an edition of Mondino, in which many of the illustrations executed for the previous volume were utilised a second time.

Berengario and Eichmann did good service in the cause of anatomy, and prepared the way for a higher school that was destined to relegate that of Mondino to the Araf of the imperfect sciences. Berengario had half caught the idea of a genuine treatise upon the anatomy of man, based upon direct investigation, but the consummation of such a work was reserved for a far greater mind—that of the Belgian, Andreas Vesal.

VESALIUS.

The student of medicine of the present day, who recognises the name of Vesalius only in association with an unimportant little foramen in the base of the skull, is scarcely aware that it is to his precocious genius we owe the entire scheme of human anatomy, as a study involving precision of observation and description. Yet so it is, for to turn from the pages of his predecessors to the *De Humani Corporis Fabrica* of Vesal, is to step from the confusing glimmer of conjecture

Fig. 2. From Vesalius, *De Humani Corporis Fabrica*.

and tradition into light and order. Much, indeed, is here left incomplete, but all is prepared for completion; and it is to be especially remarked that, from the first, the great teacher availed himself of the assistance of the painter and engraver, and directed their interpretations of the subject at every step. It is possible that he himself learned much in teaching his coadjutors, and it is certain that the value of his own labours was doubled by the aid derived from the skilled penell which wrote his story in characters that all

men could understand; it was, indeed, by means of pictorial broad sheets—a form of publication that appears to have been very prevalent in the sixteenth century, and perhaps earlier—that his work first became known, for six large plates engraved on wood, after the drawings of a pupil of Titian named Johannes Stephan van Calcar, appeared in 1538, in the form of *Fliegende Blätter*, before the author had completed his twenty-fourth year.

The *Magnum Opus* was published at Basle in 1543. To men of science it was a revelation, as an example of anatomical research upon a scale unprecedented both in magnitude and in minuteness; and to amateurs of art the volume has always been precious on account of the happy union of power and veracity in the designs, and the skill with which they have been transferred to wood by the unknown engraver. The drawings, with a few exceptions, convey the essential features of the subject with the smallest amount of apparent labour, and, unlike many of the illustrations of later works, they never digress from the object they were intended to serve, for although a little artistic fancy appears in the attitudes and attributes of some of the full-length figures, the cuts are in other respects as sober and practical as those which appear in the pages of Gray or Quain. In point of accuracy of detail there was considerable diversity in the various sections of the work. The most satisfactory presentments, as might have been conjectured, were those of the undissected body and of the bones and muscles. The nude forms which display the surface markings and proportions are strikingly noble, and expressive, and leave nothing to be desired in correctness of outline.

Fig. 3. From Vesalius.

The skeletons and myological figures, inspired with life by the fancy of the artist, were freed from repulsiveness without sacrifice of the essential truths; but the drawings illustrative of the nervous system are amongst the least successful, although the dissector had prepared his material with skill and care.

It is not indeed to be expected that many of the cuts would display the minute indications of detail that are looked for in even the least ambitious manual of our day, but the main features were faithfully described and portrayed, and the work as a whole was a miracle of wide and original research, adorned with the best artistic judgment. It is difficult to say whether it was the illustrations or the text that exercised the stronger influence over the contemporaries and followers of the author, but for a century afterwards the anatomists of Europe did little more than compose variations upon the conjoint triumphs of Vesal and Calcar. An "epitome" with enlarged cuts was published in the same year, and a second edition of the entire work appeared in 1555, nine years before the death of the writer. This revised edition is printed on better paper, and is preferred by collectors to the first.

A complete list of the works in which Vesal's illustrations were imitated, would be too long to offer in this place, but a

few deserve a passing allusion. The first systematic treatise upon anatomy in England was a compendium by Thomas Geminus in 1645, in which the designs of Calcar were translated upon copper plates, losing nearly all their strength and beauty in the process. A smaller and later volume by John Bannister, entitled "The Historie of Man, sucked from the sappe of the most approved Anatomists, and published for the Utillite of all Godly Chirurgians within this Realme" (1678), borrowed a few woodcuts from the same source. The well-known *Description of the Body of Man*, by Helkiah Crooke, published in 1616, had also sucked a good deal of its "sappe" from the great Vesalian tree of knowledge; and lastly, in France, the works of Ambroise Paré (1563) were illustrated largely by copies from Vesal, but included many other wood engravings of great interest for the student of the early history of surgery.

CAROLUS STEPHANUS.

Vesal was not without rivalry in the field of anatomical investigation. In 1645, two years after the appearance of the *De Humani Corporis Fabrica*, a French physician, named Charles Estienne (Carolus Stephanus), published a book descriptive of the dissection of the various parts of the human body, embellished with woodcuts of a curious character. The author, whose work was commenced before the appearance of that of Vesalius, was a practical anatomist, but, although an original worker, he was immeasurably inferior to Vesal, and he employed the assistance of art in a less intelligent manner. In Vesalius the illustration, while of the highest merit, was always secondary to the subject of the text; but in Estienne's cuts the anatomy often appeared to be little more than a vehicle for the fanciful designs of the draughtsman, who is said to have been Rosso de' Rossi. Some of the drawings were, indeed, rather striking as artistic compositions, but they were unskilfully engraved, and included an exuberance of extra-anatomical detail and a misplaced affectation of sculptural effect that are often grotesque in their disproportion to the real object of the illustration. In the plate now shown, for example, we see the entire form of a man

Fig. 4.—Carolus Stephanus, *De Dissectione Partium Corporis Humani*.

In the foreground of a pastoral landscape, his calvaria hanging upon a withered branch above his head while his denuded dura mater turned towards the spectator constitutes the square inch of anatomy in the quarto page of engraving; and in another, a nude full length figure of a woman seated in a chamber of severely classical architecture, has no further object than to display the contour of the external genitals. Nevertheless except in the case of the muscles, which were execrably caricatured, the anatomy was for the most part fairly truthful, and it was evident that the author had carefully supervised the work of the engraver, for in many plates it may be seen that a portion of the block, probably where the

first interpretation was unsatisfactory, has been cut out and replaced by a new and presumably better rendering.

EUSTACHIUS.

A far more serious competitor, however, of Vesal was the Italian physician Bartolomeo Eustachi, whose published work on the anatomy of the kidneys was an admirably thorough piece of original investigation. He, also, had many plates engraved to illustrate his anatomical writings, but only eight of these appeared during his life, in association with his *Opuscula Anatomica* in 1564. Thirty-nine other engravings, executed under his directions not later than 1562, remained unutilised until a hundred and forty years after his death, when they were at length published by Lancisi in 1714, together with the original descriptions, under the title of *Tabulae Anatomicae Bart. Eustachii*. Despite their prolonged repose in the Sleepy Hollow of the lumber rooms of Eustachi's unappreciative heirs, the pictures were so little behind the age when they were introduced to the world that edition after edition was called for, the demand ceasing only at the beginning of the present century. The representations

Fig. 5.—Eustachius, *Tabulae Anatomicae Bart. Eustachii*.

were indeed in some respects even richer and more trustworthy in detail than those of Vesal; and although both drawing and engraving were feeble and unattractive, the scientific value of the plates was more than sufficient to compensate for their æsthetic defects.

ILLUSTRATIONS OF ANATOMICAL BOOKS BY COPPERPLATES.

The third period, extending from the middle of the sixteenth to the early part of the nineteenth century, may be termed that of artistic engraving on copper. It is, of course, well known that chalcography had been practised long anterior to this time—at least as early as 1461—and was employed with admirable effect by Mantegna before the end of the fifteenth century; but the few examples of the process that had appeared in medical books before the seventeenth century were of small artistic importance when compared with the contemporary work of the wood engraver.

Amongst the first of the new series stands the *Historia de la Composicion del Cuerpo Humano* (1556), by Joan Valverde de Hamusco, a Spaniard, who had studied anatomy under Colombo and Eustachi. The illustrations to this work, attributed to a Spanish painter named Becerra, are mostly adaptations of the pictures of Vesalius, and are skilfully engraved on copper. One, however, is entirely new, and represents the figure of a man who, having just succeeded

It has been supposed that, as the anatomical details in a few of these plates were confined to those portions of the block which had obviously been let in after the completion of the rest of the engraving, the woodcuts had originally been executed for a different purpose, and were merely adapted by Estienne. A careful examination of the series will, however, disprove this view.

in dissecting himself of his skin, stands in an attitude of dignified self appreciation, grasping the bloody knife in one hand whilst with the other he holds up to view his detached integuments from the midst of which the flaccid cortex of his face gazes in feeble deprecation at the spectator. This offers a curious instance of the tendency manifested by the old anatomical artists to make the most of the subject from their own point of view.

The use of the wood engraving in the embellishment of anatomical works did not end during this latter half of the sixteenth century or afterwards, but it ceased to hold an important place in the illustration of the more ambitious works of our professional ancestors. Many writings, however, of great value, such as the contribution of Constantio Varoli to the anatomy of the brain (*De Nervis Opticis*, etc., 1573), the *Historia plerarumque partium Humani Corporis* (1585) of Salomon Alberti, and the artistic treatise *Varia Commensuratione para la Escultura y Arquitectura* (1585) of Juan de Arphe were illustrated by woodcuts; but the power that stamped the cuts in Vesal had vanished.

In the seventeenth century copperplate engravings, which had been applied to anatomical illustrations in the previous century by Eustachii, held undisputed sway. The anatomical works of Giulio Casserius (1627), and those of his successor in the chair of Padua, Adrian van der Spiegel (1659), were abundantly and artistically illustrated by

cosmicum." The plan, which was undoubtedly older than Rembrandt, was not without merits, and has been utilised, with various modifications, by many authors of later times, but the pictures have generally been lacking in originality and artistic interest. Those of Rembrandt offered nothing remarkable in this respect, but his book is of value to the curious on account of the ingenious way in which the draughtsman by masking the female genitals with the warning face of a demon, and preparing the way for the exposure of the womb by a veil of smoke and flame, from the ashes of an expiring phoenix, has imparted a metaphorical flavour to the scientific details of his designs.

The great landmark of progress in the yet somewhat sterile region of medical science, the immortal *Exercitationes Anatomicae de Motu Cordis et Sanguinis* of Harvey, was printed in 1628, but the work owed nothing to the quality of the copper-plates which illustrated it, nor did English art appear to advantage in any of the anatomical publications of the seventeenth century. The plates in Samuel Collins's *System of Anatomy* (1685), executed by Faulstich, displayed less excellence than might have been expected from so able an engraver, and those of a nearly contemporary treatise upon the muscular system by John Browne, a surgeon to St. Thomas Hospital, have still smaller claims to our admiration. The pictures in the latter case were interesting from the fact that the names of the muscles were engraved upon the parts (a practice which was revived in modern English textbooks by Mr. Luther Holden), but the dissected figures, drawn with pretentious badness, are placed in the most curiously affected and self-conscious attitudes, as though proud of the parade of their anatomical details; and even the claim of originality is wanting, since many are obviously imitated from the earlier and better designs of Casserius. The work, however, ran through four editions, so that it must be supposed to have possessed qualities of more importance than those of mere attractiveness.

BIDLOO AND COWPER.

The palm of artistic excellence in the medical books of the seventeenth century belongs to Holland. The *Anatomia Humani Corporis* of Bidloo (1685), professor of anatomy at the Hague and Leyden, and at one time physician to William III of England, did not add largely to science, but the author took the judicious step of securing the services of an eminent painter, Gerard de Lairesse, and an en-

Fig. 6.—Casserius, *Tabulae Anatomicae*.

this purpose, after the designs of Fialetti, a pupil of Ormonaldi and Robusti. Another precious set of drawings were made a little later by the famous painter Pietro Berrettini or Pietro da Cortona, for the anatomist Johannes Maria Castellanus, and skillfully transferred to copper; but these plates, like those of Eustachii, were allowed to remain buried, and it was not until a century later—in 1741—that they were discovered and published; a lapse that was the more to be regretted on account of the spirit and accuracy of the representations. In the sketches of Fialetti and Berrettini, as in most instances where painters have interested themselves to work for the anatomist, the grimness of the motive disappears under the artistic glamour of vitality, or even of humour.

"DISSECTED" PLATES

A noteworthy feature of the same period was the invention of dissected plates of anatomy, in which the various structures of the body were displayed as far as possible in their natural interrelations by means of overlapping segments of paper, each bearing the outlines of a portion of the surface, or of an organ or set of organs, and so attached that it might be reflected in the natural order of superposition of the parts represented. The idea has been attributed to Johann Rembrandt, of Ulm, whose tables first appeared, without his permission, in 1613, under the title of "*Catoptrum Micro-*

Fig. 7.—Bidloo, *Anatomia Humani Corporis*.

graver (A. Riechelting?) of almost equal talent, and to the present day his book has remained greatly prized, if little read. Many of the plates, although of astonishing vigour and too naturalistic both for art and for science, but in two of the oecological designs which are especially remarkable as works of

art, the temptation to pictorial allegory was too strong for the artistic mind to resist: in one of these, a figure standing within the entrance of a sepulchre, magnificent even in its fleshlessness, holds up an hourglass as though to warn us that our state was separated from his only by the moments of passage of a few falling grains of sand; and in the other, the animated skeleton is seen retiring into the grave, not without a certain grace and dignity, to escape from a world where the stern simplicity of the unclothed bones could find neither sympathy nor repose. These plates were annexed in 1697 by an English surgeon, William Cowper, to illustrate a work of his own. Cowper had previously published in another

Fig. 8.—Cowper, *Myotomia Reformata*.

volume, entitled *Myotomia Reformata* (1694, reprinted in folio in 1724), a volume containing many curious and well-executed engravings of the muscles and a number of quaint initials and headpieces.

Before leaving the seventeenth century it may be noticed that the two great painters of that period, Rembrandt and Rubens, have left their mark in connection with medical science: Rembrandt in his celebrated picture of the physician Van Tulp demonstrating the muscles of the arm in the anatomical theatre of Amsterdam (painted 1632), as well as in two other works less known, and Rubens by some bold and characteristic sketches of the superficial forms of anatomy, one of which has been rather ill-produced on copper in the *Myotomia Reformata* of William Cowper.

CHESELDEN AND ALBINUS.

In the next century (the eighteenth) anatomy was dignified by the publication of some splendid anatomical folios, printed in the most sumptuous style and embellished with costly plates and exquisitely-engraved vignettes and *culs de lampe*. How a sufficiency of purchasers could be found for such princely volumes it is hard to say, for the medical profession was not rich, and even the burin of Van der Gucht, of Vander Laar, and of Strange, and the harmonious colour printing of Ladmirel and the Gantiers could scarcely attract the outside world when employed to depict the details of the dissecting table, yet it is certain that the subscription list was a very substantial one. Practically there was but one method of reproduction during the period comprising the eighteenth and the first twenty years of the present century, and that an expensive one—etching on copper—for the wood block had fallen from its high estate, and gave us no more pictures like those engraved for Guido Guidi and Vesal.

The list of notable volumes is too large even for enumeration, but we may select as specimens for beauty of illustration the *Osteographia*, or *Anatomy of the Bones*, by William Cheselden (1733); the *Tabula Sceleti et Musculorum Corporis Humani* of Bernhard Siegfried Albinus, of Leyden (1747); and the *Anatomia Uteri Humani Gravidi*, by William Hunter (1774). Cheselden's work includes, besides the representation of typical human osteology, some characteristic examples of bone diseases, and a number of beau-

fully etched representations of skeletons of the lower animals. The author, a man of artistic judgment, spared neither

Fig. 9.

Fig. 10.—Cheselden, *Osteographia*.

trouble nor expense to secure the most artistic reproduction of his preparations, but he was above all a man of science, and as he did not care to risk any sacrifice of truth by trusting to the unaided eye of the draughtsman, he had each specimen drawn under the camera obscura. The result, as may be seen, lost nothing in vigour, and the *Osteographia* is a volume we are proud to number amongst the medical literature of our country. The way had been prepared for this large work by the modest octavo entitled *The Anatomy of the Human Body*, first published in 1713, and which, like its successor, included morbid as well as normal anatomy. It was necessarily a mere outline, but it contained much that was of interest, and the plates, engraved by Gerard Van der Gucht from drawings made with the assistance of the camera, were novel and attractive.

The Atlas of Albinus was a far more scientific and important work than that of Cheselden. Myology had been well and broadly treated in the illustrations to many older volumes, but the minutiae of form, origin, and insertion of each individual muscle were here represented for the first time, and the task was accomplished with so much thoroughness that little has remained for us to add. The drawings of the various figures display great skill and accuracy, and although the engraver has injured the effectiveness of the design by a mechanical hardness of style, and an inability to reproduce the textural character of the structures, he was able to preserve so well the essential truths that the noble atlas fully merits the rank it held during three generations as a standard of reference both for artist and surgeon, and the flattery of imitation that led to the incessant repetition of the plates upon almost every scale up to that of Nature. It was not until near the middle of the present century that its place was taken by other works more suit-

able to the requirements and pocket of the student. The illustrated volume issued by the same author devoted to the bones—*Tabulae Ossium Humanorum* (1784)—is especially to be

Fig. 11.—Albinus, *Tabulae Sceleti et Muscularum Corporis Humani*.

remembered as containing the first attempt to show the exact area of the muscular attachments upon the bones, and the only attempt to indicate in a similar way the ligamentous attachments.

William Hunter's treatise on the Gravid Uterus may rank with Cheselden's *Osteographia* as an ornament to the library, for the best art available at the time had been lavished over a subject that would appear little susceptible to æsthetic treatment. The foremost engravers of the day were employed upon the plates, and one of the number, the famous Sir Robert Strange, is said, in John Hunter's preface to the treatise, to have given "his advice and assistance in every part of the work with a steady and disinterested friendship."

Other examples of anatomical plates embraced within the same period were those illustrating the *Observationes Anatomice* of Santorini (1724); the beautiful etchings of the *Anatomy of the Horse* by Stubbs (1776), one of the most

Fig. 12.—Stubbs, *Anatomy of the Horse*.

painstaking examples of anatomical art in existence; the *Icones Anatomice* by Haller (1756); the *Demonstrationum*

Anatomico-pathologicarum by Peter Camper, of Leyden, who was an accomplished artist as well as an anatomist and physician; of J. J. Sue's *Elements d'Anatomie à l'Usage des Peintres, des Sculpteurs, et des Amateurs*; Salvage's *Anatomy of the Gladiator* (1812); Van Soemerring's *Tabulae Sceleti Fœmini* (1797); Caldani's *Icones Anatomice* (1801-13); Mascagni's colossal volume of *Unicerebral Anatomy* (1823-32), as well as the useful but not very pleasing pictures in his *History of the Lymphatics* (1787); the bold but coarse and not very exact engravings of the *Bones, Muscles, and Joints* by John Bell (1710); and the less inelegant but still unsatisfactory etchings of Sir Charles Bell published between 1816 and 1833. In conclusion, we may refer to the hideous anatomical plates of Lizars as a work suitable to mortify the flesh, after vain-glorious rejoicing in the splendour of the embellishments bequeathed to us by Bidloo, Cheselden, and William Hunter.

The application to medical and anatomical purposes printing in colours from engraved copperplates was originated by Le Blon as early as 1721, and further developed by Jan Ladmiral about 1736, and by J. F. Gautier d'Agot and his son between 1745 and 1773. The process is well exemplified in Ladmiral's plates of the male genitals, and in Gautier's illustrations to Duvernoy's *Description of the Muscles* (1746).

MODERN PERIOD OF ANATOMICAL ILLUSTRATIONS.

The fourth and latest period may be dated from the close of the second decade of the present century. Art has become more and more indispensable to us as an aid both to record and to explication. The diagram, the more highly-finished drawing or engraving, the photograph, and the model serve as a new language that speaks with strength and clearness where written or spoken words would convey their meaning slowly and imperfectly. The new period has been characterised by an immense quantitative augmentation of illustrations, by the increasing preference shown for diagrammatic clearness over artistic effect in the rendering of anatomical detail, and by the multiplication of methods of pictorial reproduction. We have no Lionardo da Vinci, Calcar, Fialetti, or Berrettini, but the modern draughtsman makes up in comprehension of the needs of science, all he lacks in artistic genius. We can boast no engravings as effective as those of the epitome of Vesal, and even of the plates of Bidloo and Cheselden, or as rigidly accurate as those of Albinus, but we are able to employ new processes that reproduce the drawing or the original object without interpretation, and others that give us useful effects of colour at small expense. Our art is less picturesque but more serviceable and more easy of access.

Engraving on copper, which occupied so important a place during the last period, yielded to cheaper and more readily adaptable processes, but a few specimens of chalcography appeared even as late as the middle of the century. The steel plates, as modified by Warren in 1818, served for works in which delicacy of line was more particularly sought, but the result was not satisfactory. Wood engraving, which had fallen into decay, was revived by the teaching of Thomas Bewick, and placed once more in the forefront amongst the resources of the book illustrator. The colour-printing of Le Blon, Ladmiral, and the Gautiers was replaced by chromolithography, and afterwards by chromo-xylography. Lithography, invented about 1796, was destined to hold an important place in medical illustration. Photography and photographic processes of engraving were found of value where an exact transcript from Nature or from a drawing was especially desirable. Finally, drawing and painting served as before for illustration when immediate multiplication of the design was unnecessary or impracticable, and hand-colouring was employed to lend character to pictures engraved by the ordinary processes.

LITHOGRAPHY IN ANATOMICAL ART.

The first important medical essay in lithography appears to have been the engraved plates of the *Arteries*, published by Tiedemann, in 1823, but the result here was by no means striking. It was not long afterwards, however, in 1831, that Jacob, the father of the modern French school of anatomical drawing, threw a new light upon the possibilities of engraving on stone in the great anatomical work of Bourgery.

The less vigorous but more accurate plates executed by Leveillé, Jacob's favourite pupil for Fan's *Anatomie des formes extérieures du Corps Humain* (1847) and the nearly contemporary drawings of the bones, ligaments, and muscles for

Fig. 13.—Bouvier, *Anatomie Descriptive*.

Danmy, by Kistler Beau (1844), fully maintained the reputation of the new manner; but the highest point of excellence was reached by Leveillé's designs for Hirschfeldt's *Anatomie du Système Nerveux* (1853), which has placed France beyond rivalry in anatomical illustration. The best treatise on Art and Anatomy, that of Dr. Paul Richer, is illustrated partly by lithographic plates, all from drawings by the gifted author, and in this country several good examples of the same method of reproduction have seen the light, some by professional draughtsmen like Ford and Cuthbert, and others by such distinguished members of our own profession as Macellae, Holden, and Gadlee.

Engraving on steel, as applied to anatomical pictures, has been less successful, even where the drawings have been supplied by highly competent hands. The best specimens are perhaps to be found in the works of Beraud, in which the hand colouring is particularly delicate.

MODERN WOODCUT ILLUSTRATIONS.

Despite the great development of wood engraving during and since the time of Bewick, there is little that we can show with gratification in anatomical illustration. The work of the artist is usually translated in a more or less ignorant style by the engraver before it is presented to the public; but some exceptions should be pointed out. The cuts by William Bagge, after the drawings by his brother, which appear in Wilson's *Anatomist's Vade-Mecum* (1849), are full of vigorous expression and artistic feeling; but here the engraver knew his subject. The drawings by H. V. Carter in Gray's *Anatomy*, engraved by Nichols, are admirable examples of clear diagrammatic work, and some of the cuts by Sailer in Sappey's *Anatomy* may be noticed on account of their minuteness of detail, but in other respects are distinctly inferior to the works of Bagge. In Germany the atlas of Charles Roth (*Plastisch-Anatomisches Atlas*, 1872) the illustrations in the *Praktische Anatomie* of Kollmann (1880), and those in the valuable work of the late Professor Brücke, *Sehnsaitz und Fehler der menschlichen Gestalt*, may also be noted as good examples of artistic xylography. As a rule, however, the woodcuts illustrating anatomical books do not deserve a large amount of credit for artistic beauty or a rigorous accuracy. A few rise above the level of average excellence, more fall below it, and it is not pleasant to confess that the lowest depths of badness seemed to have been plumbed in two or three works of the present generation published in our own country. Many good cuts—perhaps almost the last of their kind, for the wood block is

doomed—appear in the latest edition of Quain's *Anatomy*, and in the large and promising anatomical baby, the *System of Anatomy*, just edited by Mr. Henry Morris.

Chromoxylography, a process of respectable antiquity—for it appeared on the frontispiece of one of the first anatomical books issued from the press—has been applied to medical illustration only within the last few years, chiefly for the purpose of accentuating the course of vessels in anatomical textbooks; but a higher promise is indicated by the pleasing and expressive cuts in Merkel's *Topographische Anatomie*, and the still more recent works of Testut, Poirier, and others.

Photographic illustrations from dissections have been employed in a few anatomical works, with results that are distinctly unpleasant to the eye, and not very profitable to the mind, but it is certain that before long the numerous modifications of photographic reproduction of drawings are likely to displace the wood block altogether, on account both of their cheapness and their unerring though unselective exactness.

GLYPHIC ART IN ANATOMY.

Glyphic art as applied to artistic anatomy probably dates from the time when Michael Angelo modelled the muscular forms of figures which he proposed to execute in marble. Herrera, the painter who illustrated Valverde's book on anatomy, is said to have made the first anatomical figure in plaster for the use of artists. Fischer, a Professor of Anatomy to the Academy of Sculpture in Vienna near the end of the last century, was the author of a striking model constructed for the same purpose; and several other more recent examples which may be seen in most of our schools of art have been provided as a guide for students of drawing. Landi, in the present century, was the designer of a well known figure, to which he published an atlas of plates, and casts have been taken from actual dissections—one, to be seen in the Royal Academy schools, of a corpse in the position of crucifixion, but, as might be expected, the effect is repulsive, and unredeemed by useful qualities of any kind. The best and most accurate examples are, perhaps, those of the small figure known as "Alex Defying the Gods," and the equine model of Auguste Coubeur.

Sculpture as adapted to the illustration of medical anatomy is of greater antiquity. The figure found in Rome in the villa of Antonia Musa, the physician to the Emperor Augustus, is perhaps the earliest example in existence, but wood carvings of a similar nature have long been employed both in China and Japan. The more serious specimens, however, are of recent date. One of these, still in use, is a complicated life-size model in papier maché, made in Paris, which can be taken to pieces in such a manner as to demonstrate more or less correctly the form and relations of nearly every part of the body, but the idea has been brought into service in a far more scientific manner by Professor Hise, who by taking casts of organs that have been hardened *in situ* has given us a means of studying the topography of the viscera that is far superior to anything before at our disposal.

Models in wax, *à la Fusard*, have been in use for many years, and much artistic talent has been employed in conferring upon them a realistic character, which has sometimes been greatly abused in the interest of the proprietors of "museums." For purposes of anatomical teaching they have fallen into disuse, although they still supply a want in pathological reproduction.

Finally, a word must be said for the votive offerings of models of selected parts of the body made to the gods in the days of ancient Rome, to accompany a prayer to the gods for aid in sickness or thanks for a recovery accomplished. An interesting account of these from the pen of Dr. Simmon has recently appeared in the *British Medical Journal*.

SUMMARY.

The service that Art has rendered to anatomy is sufficiently apparent even in the collection that, chiefly through the kindness of my friend and colleague, Dr. Payne, we are able to bring forward to-day. We all know how indispensable the book illustration has become to fix and clarify our knowledge, and how grateful we are to see it like an oasis in the midst of the desert of text. It is true that pictorial anatomy, like every other good thing, may be misused. It is a poor substitute

for reference to the original structures, although for many parts of the body it is a necessary one for the ordinary student, but it is always a very efficient preface and an invaluable sequence for such reference, for it shows us better than any written description what to look for, and it recalls to us what we have seen.

The service that a love of art may confer upon us personally and individually is a matter of a different kind. The study of art is a mental culture of no mean order; it affords a training for the eye that is invaluable to the surgeon, and there is no hobby that can reflect more rays of brightness athwart the dull shadow of the daily routine of our professional life. Happily there are few of us who do not cherish hobbies of some kind, for there are few of those who have them who are not wiser and better for them. Our ranks, moreover, have furnished many distinguished patrons of art, collectors who are known throughout Europe, and not a few amateurs who have displayed a power of artistic achievement that would have made them great artists had not their destiny called them to be eminent physicians and surgeons instead.

Of the use of even a moderate degree of skill in draughtsmanship to the teacher of anatomy little need be said, for it is obvious that he who can flash an idea clearly and pleasantly by a stroke upon the black board will, other things being equal, best hold the attention of his audience and send them away with the best mental picture of the subject of his discourse.

USE OF ANATOMICAL STUDY TO THE ARTIST.

As to the use of anatomical study to the artist opinions are greatly divided. Ruskin, who has done what man may do to elevate art criticism to a science and to embellish it with golden phrases, avers that science is worse than useless to the painter or sculptor, and there is much to be said for this view. As I have endeavoured to show, the greatest and most realistic masterpieces of Greek sculpture were created before the idea of dissection, as we understand the word, was tolerated, and one of the noblest works of Michael Angelo, the "Moses," was that in which his anatomical research was least apparent. Realistic works of a remarkable kind were also done by Egyptian and Japanese wood carvers under conditions which made the practical study of anatomy well-nigh impossible. But, on the other hand, all the greatest artists of the European Renaissance were close students of anatomy, and some of the greatest living artists are as learned as they were. It is not the knowledge but the misuse of the knowledge that is dangerous, and there is no doubt that the pride of Michael Angelo in his anatomical attainments led him to neglect that close study of the living model which had given perfection to the work of Phidias; hence it is that the critic who is dumb before the old Greek may feel compelled to temper his admiration of the Florentine with a regret that so great a mind should have stopped short of the highest goal. That Phidias attained consummation in art without scientific education proves only that there is no law for the highest genius; the writings of Shakespeare do not tower above rivalry because he knew "small Latin and less Greek," but because, with Phidias and, perhaps, a dozen other men in the world's history, he rose far above all theories of education. Setting apart such men as these, the greatest artist in art or literature will always express best what he best understands. The wise man is he who knows not merely a fact, but the meaning of the fact, and Science will not fail to stimulate and guide observation when it is not weakened by admixture with an overweening pride in itself.

It may be said that scientific truth in works of art appeals to few. To please the average "man in the street" the artist must tell a story, and must show certain dramatic or sentimental effects and certain tricks of composition; and if he does this his anatomy, his botany, and his geology may caricature Nature, and the picture find admirers and purchasers. The great artist, however, does not labour for the ignorant many but for the few who know; and the greatest work will always bear the most learned criticism, and enjoy the greatest share of immortality.

OBSERVATIONS ON SURFACE FORMS IN ANATOMY.

Lastly, and here for us is the most practical part of this

discourse, to which you have done me the honour to listen so patiently, let us consider whether we may not take a hint for ourselves from the artist anatomist. As a technical point, it may be observed that artists have from very early times perceived and represented phenomena in muscular action that anatomists have practically ignored. In fact, the well-trained artist knows far more of the surface forms of the living figure than we, despite the months we have expended in poring over anatomical treatises and in dissecting the dead subject in our schools. Those of us whose function it is to examine the student at the end of his four or five years' work in the dissecting room and the wards, see with sorrow how little the average pass man is able to recognise the meaning of the surface phenomena of the human body, and the sorrow should be the greater because it is the fault of the system which is created and administered by our noble selves. We devote the best hours of our pupils' early years of study to what we call anatomy. He is taught to reflect the skin, to clean the muscles, to define the vessels and nerves, and when all is done, if he has worked well, he may for a brief space be able to recognise any of these structures when they are exposed before him upon a dissection like that which he has made for himself or has seen in the dissecting room, and he will give—from his textbook usually—the main facts relating to them with fair accuracy; but if he ends here he is for ever ignorant of the knowledge that the surgeon and physician should possess, for he knows only the fully dissected anatomy of the corpse and little or nothing of the living normal anatomy of the people whose diseases it is his function in life to treat. His education has stopped short of the point when it would have become interesting and profitable. I venture to express strongly the opinion that every course of anatomy should include a careful demonstration upon the living model of the relation of every important structure to the surface, and an explanation of every eminence and depression, every ridge and sulcus that mould the elastic skin in repose and in action; that every wrinkle in the skin itself shall be noted and its meaning understood; and finally, that the relation of all these points of observation to physiology and pathology, to medicine and to surgery should be carefully elucidated. Then the student will know what he ought to know, and what he will be able to remember and apply in the practice of his profession.

To effect this reform it is necessary that the examining bodies should do at the anatomical and physiological examinations what is to some extent done in the final examination for the Membership of the College of Surgeons (but not for the Fellowship, where it is even more important)—to institute a special table upon which is a living model, and test every candidate's knowledge of surface markings thoroughly. Then, and then only, would the right anatomy be systematically taught in our schools. It may be objected that the time at the disposal of the student will not permit such an addition to his course; but, if something must be sacrificed, let it be a portion of the time spent in dissection. The ordinary student dissents too much and observes too little, and it would be far better for him to learn his anatomy, as he may profitably do, from parts that have been carefully prepared by a skilled prosector—a junior demonstrator, let us say—rather than from the cadaver that too often represents his own dissection. He will learn far more in much less time. The candidate for university honours or for the Fellowship of the College of Surgeons may dissect as much as possible, but for the great bulk of our students, those who are to enter general practice, too much time is spent upon the so-called "practical anatomy" and too little upon the anatomy that is really practical.

This prayer for the study of living anatomy is not the first that has been offered up. At the last International Congress in London, Professor Kern, of Philadelphia, a distinguished surgeon and an authority on artistic anatomy, spoke eloquently and forcibly in the same direction, and I recollect that he was warmly supported by Mr. Luther Holden, who is an artist as well as an anatomist; and if my advocacy to-day aids theirs in bringing our teaching a little nearer to the goal of rational anatomy I shall be content.

Mr. T. E. Allen (secretary) said he was not an artist, but

he knew something about the anatomy of the human foot. He thought that the great toe should not be shown flexed in the works of artists. The foot was not a grasping organ, but must be regarded, in his opinion, as a pressing organ intended to press upon the earth.

Mr. L. M. GARRER (Bristol) said that the illustrations of the treatise of anatomy by Bidloo had been adapted by Cowper.

Professor A. THOMSON (University of Oxford) advocated the remodelling of the teaching of anatomy, and said the majority of students knew very little surface anatomy. At Oxford every student was examined in anatomy upon the living model. He thought this method of teaching was of the greatest value.

Dr. J. F. PAYNE showed an anatomical woodcut of the time of Elizabeth or Mary, which was one of the earliest English woodcuts of dissected figures.

Professor KERN (New York) referred to the illustrations of Muybridge and Eddison. He said that the living model, the skeleton, and the dissected body should be used at every lecture on anatomy, even when the lecture dealt with osteology alone.

Professor THANE said he did not agree with the proposal that the period of time which students of anatomy devoted to this subject should be reduced. At University College students who were preparing for their final examination went through a course of anatomy on the living model. He thought that often accuracy of anatomical detail was a disadvantage for the artist, but it was most important to students of medicine. Vesalius in his anatomical figures had a small bone in the hand and foot which had not been found by any other anatomist.

Mr. THOMAS COOKS agreed with most of Professor Anderson's remarks, and thought that the present methods of dissection might be very much improved.

Dr. MUNRO SMITH began by quoting the following passage from Ruskin: "The ideas and pleasures of imitation are the most contemptible which can be received from art; they are akin to the surprise which is felt in jugglery." He went on to say that anatomical knowledge in an artist often led him astray from the idea he wished to express (fortitude, strength, patience, etc.), because his mind was bent on minute anatomical detail. The history of sculpture showed clearly that the best sculptor's art preceded any accurate anatomical knowledge. Nothing had ever rivalled the beauty of the works of Phedias, for example, and his results were obtained (as were those of all the Greek sculptors) by combining the different beauties of different models, and by idealising. It might easily be shown that the masterpieces of sculpture were inaccurate, and that these inaccuracies were intentional, and served the purpose of revealing some idea or some beauty. In the group called the Laocoön, for example, Leasing had pointed out how unnatural the arrangement of the figures and the expressions were; how anatomy had been made subservient to the artists' idea and to their sense of beauty. It was supposed that this marvellous group was the work of three men, who were in all probability perfectly ignorant of anatomy. That famous statue the Apollo Belvedere was not correct anatomically, but the length of leg, absence of surface markings, etc., served a purpose and add to the artistic whole. One of the most striking and beautiful works of art, the "Lion of Lucerne," cut from the solid rock by Therswaldsen to commemorate the bravery of the Swiss mercenaries who died for Louis XVI, may be mentioned. The anatomy of this figure was not accurate; it had a cow's tail, an unnatural mane, and its expression was impossible. Yet few sights were so impressive and so eminently artistic. Modern realistic sculpture, anatomically correct, was a poor thing in comparison with this. Let anatomy and art remain separate, and each would be the better for it. The attempt to bring science into art and make the two work together had given birth to the so-called realistic school, which must be earnestly condemned by all who look upon art as a most important factor in human culture and as an expression of the beautiful.

Mr. J. BLACK said much sacrifice of detail was not necessary, and advocated the use of the living model in lectures, and a study by the student of his own surface anatomy.

Professor ANDERSON thanked the various speakers for their

remarks. He agreed that the plates of Bidloo's work had been annexed by Cowper. He had a good opinion of the plates of Muybridge, and thought that a study of such plates were valuable. He emphasised his opinion of the value of the practical study of anatomy, but suggested that dissections should be prepared by prosectors, and that these should be studied by students. Too much time was wasted by the ordinary student in making bad dissections.

BRITISH MEDICAL ASSOCIATION.

SIXTY-THIRD ANNUAL MEETING.

THE SECTIONS.

BRIEF SUMMARY OF PROCEEDINGS.

Friday, August 2nd, 1896.

SECTION OF MEDICINE.

AN extremely interesting and well-sustained discussion on the Causes of Acute Rheumatism and its Relation to other Affections was opened by Dr. Cheadle. In a lucid and comprehensive paper, dealing with the subject mainly from a clinical point of view, he dwelt first on the protean manifestations of the disease and its relationship with other morbid conditions, believing that these must first be grouped to throw any real light on the natural history of the disease. Rheumatism must no longer be considered a mere joint affection; arthritis was only one of its many manifestations. The other manifestations were best seen in children in whom curiously the joint affection was often trivial and even absent, but in whom endocarditis, pericarditis, chorea, etc., assumed great importance. It was pointed out that endocarditis and pericarditis were almost invariably rheumatic in origin, exception being made of such causes as pyæmia, chorea, the erythemata, purpura hemorrhagica; many cases of tonsillitis were also classed as rheumatic. Subcutaneous tendinous nodules were exclusively due to rheumatism. The other affections named might be excited by other causes, but in the majority of cases were rheumatic, and occurred only in those with the rheumatic diathesis. As age increased it was curious how the rheumatic manifestations changed; after puberty the subcutaneous nodules were no longer seen, the tendency to heart affections was less, chorea was rarely seen, and the erythemata declined. The joint affections alone increased in frequency and severity. It was in the virgin soil of childhood it was seen what rheumatism might be. Passing on to the etiology of acute rheumatism the importance of chill was insisted on, especially if combined with physical fatigue. Hereditary tendency, especially if on both sides, was, however, the most important factor. The ultimate cause could not at present be determined. Personally the speaker inclined to the view of a toxæmia, the poison possibly being produced by a micro-organism living in the body. This possible origin was supported by analogy, by its occasional epidemic prevalence, and by the specific action of salicylates. On the other hand, no good evidence of direct personal transmission had been adduced and no organism had been discovered, but these were not fatal objections. The discussion was continued by Sir Dyce Duckworth, who agreed almost entirely with Dr. Cheadle. He expressed the opinion that there were many kinds of rheumatism; it was not at all a simple joint affection, and he laid great stress on the importance or even necessity of a predisposing diathetic condition which was undoubtedly inherited. Dr. Archibald Garrod, who followed, attempting to explain the pathology of chorea on the assumption of a microbic origin of rheumatism, drew a suggestive analogy between it and the nervous sequelæ of diphtheria. He suggested that chorea might depend on a toxin produced by the hypothetical rheumatic micro-organism. Dr. Mantle (Halifax) gave instances of the epidemic prevalence of rheumatism, but disputed the rheumatic nature of erythema nodosum. In this latter view he was later supported by Dr. Lees. The discussion was ably carried on by Dr. Haig, who ex-

pounded his well known uric acid hypothesis; Dr. Stephen Mackenzie, who severely criticised this theory; Dr. Handford, Dr. Longhurst, and others. Dr. Cheadle briefly replied. Some interesting papers, dealing chiefly with cardiac affections, were then read. Especial mention must be made of Dr. Caton's paper on the Arrest of Endocarditis in Acute Rheumatism, in which he strongly recommended the application of blisters to the precordial area from the commencement of the affection. He supported his conclusions as to the beneficial effect of this treatment by numerous experiments and statistics extending over fourteen years. Another interesting paper was read by Dr. Parsons, on Peripheral Neuritis following the application of a Cancer "Cure," undoubtedly arsenic. The arsenic had been applied by a quack, and a severe form of the disease followed. A similar case was quoted by Dr. Ernest Reynolds. The proceedings terminated by an enthusiastic vote of thanks to the President for the able and patient manner in which he had conducted the proceedings. In Dr. Favy's reply he stated that the thanks were really due to the Secretaries, on whom the burden of the day had fallen.

SECTION OF SURGERY.

Progress was the watchword of the third day's proceedings in the Section of Surgery. A large and representative meeting listened with interest, and often with enthusiasm, to the views of the pioneers in theory and practice from London, from the provinces, and from America on such essentially modern subjects as laminectomy, colectomy, splenectomy, and intestinal anastomosis. The first item in the programme was a Demonstration on the Cadaver, by Professor Murphy (Chicago), illustrating his own method of using his now famous button. He particularly emphasised the necessity of a special over-stitch at the mesenteric edge of the bowel to prevent its being left bare of peritoneum, and of a careful attention to the preservation, in so far as possible, of the artery which runs parallel to the edge of the gut, and is more important for its nutrition than the mesenteric. Professor Murphy concluded his admirably lucid address with an exposition of his method of resecting the rectum for malignant growths. Mr. Victor Horsley then read notes of Seven Cases of Laminectomy of the Cervical Spine for Caries and Injury. Three of the patients were present and walking about, and it was hard to believe that when they came under Mr. Horsley's care they were paralysed in all four limbs, and in some instances partially asphyxiated as well; of the 7 cases only 1 had died. This almost sensational result, after the gloomy decisions of last year's congress at Bristol, made a profound impression upon the audience. Mr. Horsley combines operation with the subsequent use of extension for a prolonged period. This he finds necessary for the complete recovery of his patients. Subsequent speakers, particularly Sir William Mac Cormac, Sir William Stokes, and Mr. Noble Smith, raised questions as to the diagnosis of the amount of injury to the cord in cases of fracture, and the proper time to operate in caries; and Mr. Horsley, in his reply, formulated the clinical rules which should guide the surgeon in these instances, but also insisted that each individual case should be judged mainly on its own merits. Mr. Mayo Robson then related five cases of colectomy, in one of which he used Dr. Murphy's button, in the other four the decalcified bone button. His opinion was entirely favourable to the latter apparatus. One of the cases was remarkable as an example of carcinoma of the ascending colon occurring in a girl aged 14. Mr. Greig Smith, who followed, stated that he was in the habit of using the button in his enterectomies, and gave a most cogent demonstration of the advisability of doing the operation for intestinal obstruction in two stages. His remarks on this point were cordially endorsed by subsequent speakers, and eventually accepted by Mr. Robson himself. Dr. Keen related two and Mr. Harrison Cripps four cases in which the use of the Murphy button had ended fatally, and Professor Maclewen stated that he had hitherto seen no reason to employ it in preference to sutures. Mr. C. A. Morton exhibited a specimen showing the junction made by the button three months after the operation, and Mr. Cripps gave a very interesting description of some of the complications met with in the operation of inguinal colotomy,

referring particularly to absence of mesentery as the gravest and most difficult of treatment. Mr. William Anderson read a paper on Three Cases of Sacile Hernia of the Sigmoid Flexure through the Left Inguinal Canal, and Mr. Bidwell recounted a similar case which had strangulated. Mr. W. D. Spanton gave an account of three cases of splenectomy performed by him, one of which had recovered. Mr. Cathcart showed an ingeniously simple form of exhaust pump for use after suprapubic cystotomy, after which the proceedings terminated. The meetings of this Section have been brilliantly successful as regards attendance, papers, and discussions, and the impression left by it is that in surgery, even to its most modern developments, England still indubitably leads the way.

SECTION OF OBSTETRICS AND GYNECOLOGY.

Mr. KNOWLEY THORNTON opened a discussion upon the Early Diagnosis of Malignant Disease of the Uterus, and the Treatment by Partial or Total Excision. He laid especial stress upon the great importance of early diagnosis by practitioners. It was in their hands especially that advance in diagnosis lay. He advocated supravaginal amputation in carcinoma and epithelial cancer of the vaginal portion. Operation in hopeless cases was especially deprecated, and stress laid upon the surgical rule that operations for malignant disease should only be performed when the whole disease can be removed. In the discussion Professor Martin (Berlin), Professor Pozzi (Paris), Professor Lusk (New York), Dr. Playfair, Mrs. Scharlieb, Professor Cameron (Glasgow), Professor Sinclair, Dr. More Madden, Mr. Taylor, Dr. Campbell, Mr. Bowreman Jessett, Dr. William Duncan, Dr. Smyly, Dr. Donald, Professor Spencer, Dr. Smith, Dr. Hayea, Dr. Amand Routh, and Dr. Heywood Smith took part. The majority of the speakers favoured total extirpation of the uterus, and they all agreed as to the importance of early diagnosis. Professor Murdoch Cameron read a paper on a New Theory as to the Position of Fetus in Utero, Dr. Barbour one on the Changes in the Uterus during the third stage of labour, and Dr. Fraser Notes on a Case of Uterine Cystic Fibroma. A cordial vote of thanks to Sir William Priestley for presiding was moved by Professor Lazarewitch (St. Petersburg), and seconded by Professor Cordes (Geneva).

SECTION OF PHYSIOLOGY.

On Friday many foreign and English physiologists attended to hear the discussion upon the Influence of Food upon Muscular Work. It was opened by a paper read by Professor Stokvis (Amsterdam), who related many experiments performed by himself to determine the influence of sugar on the production of muscular energy in the form of work. His experiments had led him to the conclusion that an increase of a sugar to a dietary or when given to a fasting individual did not increase that individual's power of performing work. He criticised Vaughan Harley's published papers, arguing that it was a mistake for him to have carried out all the experiments upon his own body, for by practice the muscles used became so trained as to perform a greater amount of work under similar conditions as before. This paper was followed by one by Professor U. Monso, in which he stated that, working as Harley had done with an ergograph, he too had found that an increase of sugar to the dietary considerably augmented the amount of work done. Dr. Vaughan Harley then read his paper. Replying to Professor Stokvis's criticisms, he drew attention to the rapidity of the contraction which had been employed in his experiments. This, he stated, was much too rapid and liable to introduce error and irregularity. Further he did not think the experiments he mentioned, in which fasting was involved, were of much value for experimenting upon himself. Dr. Harley found that fasting 24 hours very considerably decreased the amount of the work performed. Dr. Harley found that 30 grammes of sugar added to a dietary increased in some cases the amount of work performed as much as 50 per cent. Dr. M. S. Fembrey pointed out that according to Lehman's work with the ergograph psychical states had a very great effect upon the results obtained, but that Harley had carried out these experiments upon himself and had commenced them with a strong bias in the one direction, and

that therefore, though working in perfectly good faith, he would be very liable to reach a result in accordance with his predilections. He ought to have experimented not upon himself but upon some one who in no way understood the apparatus or the objects of the experiments. Professor Halliburton considered that not enough stress had been laid upon the proteid-sparing action of carbohydrates. Moreover, he thought that much value was to be attached in arguments of this nature to results learnt empirically. By common consent, athletes agreed that the best result in endurance and possibility of great production of work for short periods was best attained upon a diet consisting chiefly of proteids, and containing but little carbohydrates. Professor G. N. Stewart considered that too much stress must not be laid upon arguments derived from a study of production of work by various sets of men, for most of the hardest workers do well on a diet containing less than the 100 grammes per day of proteid usually considered as essential. Professor Bowditch (Boston, U.S.A.) considered that in the activity of muscle we should consider the nitrogenous molecule as essential for that work, but that in actual activity the carbon-containing portion was the part actually used up. The greater, then, the nitrogenous interchange and renewal the better the condition for work production, but the carbon-containing required frequent renewal. Professor Stokvis, in reply, pointed out that the daily variations in amount of work done in many previous researches were quite as great as the differences observed in Harley's researches. He mentioned that at his request the crew of rowing men representing Amsterdam this year at Henley had been trained very largely on proteid, and had proved most successful. But in the previous year they had been trained upon a large carbohydrate diet, and had also achieved good success. Dr. T. Gregor Brodie stated that he had been studying by measurements of certain areas the curves of extensibility and retraction, the amount of work performed by a gradually increasing load upon a muscle, and the amount produced by the muscle in raising a gradually decreasing load. He found that the latter varied between one-half to one-third the amount of the former. He further showed how he obtained a graphic representation of the amounts of work done by successive contractions raising increasing amounts of load. He found that with indirect excitation the maximum amount of work was greater, and occurred with a smaller load than in the case of direct stimulation. Dr. M. S. Pembrey gave an account of some experiments he had been carrying out on heat regulation. He concludes that the main heat regulation is carried out by variation in the production of heat from the muscles. He has further studied the gradual development after birth of the power of heat regulation in guinea-pig, chick, mouse, etc. Professor W. D. Halliburton read a paper on Nucleo-albumins. For these he prefers the rather vaguer term "nucleo-proteids," as more fitting to our present knowledge. The substance previously termed by him a cell globulin is a nucleo-proteid. He also stated that working separately from Pechlaring he has arrived at the same conclusion, namely, that Echin ferment is a nucleo-proteid. Dr. J. W. Pickering showed some of the Reactions of Colloid Substances with which he had been working. The colloid made from aspartic anhydride gave many of the proteid reactions, and when injected into the veins of a rabbit causes intra-vascular coagulation. It further shows almost exactly the same variations in action as are found when working with nucleo-proteids in the same manner. Mr. Rasmussen gave a short account of the production of Fibrin-like Coagula of Solutions of Egg White and many other Proteids by Shaking. Serum albumen, he stated, was only with difficulty precipitated. Some or part of these coagula redissolve, sometimes very rapidly, on standing. Professor Halliburton proposed, and Professor Stewart seconded, a vote of thanks to the President, which was carried with applause, and the Section then terminated its meeting.

SECTION OF ANATOMY AND HISTOLOGY.

PROFESSOR ARTHUR THOMSON (University of Oxford) opened a discussion on the Topographical Anatomy of the Abdomen. He criticised the generally accepted system as described in Quain. He took exception to it as only two of the nine

regions described correctly apply, namely, the umbilical and hypogastric areas. He proposed for adoption a new system, in which he made use of the articulation of the xiphisternum with the part above: the anterior superior iliac spine, the symphysis pubis, and the most dependent part of the tenth costal arch were taken as fixed points. He thought that the lines drawn between these points should be straight and not curved. By these lines the abdomen can be divided into the following regions: Regio hypochondrica dextra and sinistra, regio epigastrica dextra and sinistra, regio abdominalis lateralis dextra and sinistra, regio umbilicalis dextra and sinistra, and regio inguinalis dextra and sinistra. In the discussion which followed Professors Thom and Anderson, and Messrs. Lockwood, Wilberforce Smith, Parsons, and Black took part. Dr. Arthur Keith read a paper on the Symptosis of the First Piece of the Sternum to the Thoracosternum on Man and Anthropoids, considered as to its prevalence among them and its value as evidence of their genetic relationship. Mr. Graves Stoker exhibited a specimen of a floating layer which he had discovered in a body which was being made use of for operative surgery. The liver had been dissected downwards, and its lower border extended almost to the level of the umbilicus. Mr. Staveley Kent showed a number of specimens which illustrated the Histology of the Genital Organs of a Hermaphrodite Dog. No ova could be found, and in structure it somewhat resembled a testis, but no spermatozoa could be found. A distinct uterus was present. Mr. H. Higgins read a paper on the Mechanism of the Knee-joints of Man.

SECTION OF PATHOLOGY AND BACTERIOLOGY.

THE PROCEEDINGS on Friday opened with a discussion on Lymphadenoma, introduced by a paper by Mr. W. G. Spencer on Lymphadenoma and its relation to other Morbid Growths. He drew attention to its causation, and in the absence of experimental data brought forward clinical observations. These were grouped according to the mode of entry of the presumed virus. Objection was raised to the number of names used, varieties being probably due to differences in resistance on the part of the individual. The relation to other affections causing general enlargement of the glands such as syphilis and tubercle, and the experimental work now being carried on was pointed out. Mr. Jackson Clarke did not think it possible to distinguish objectively between lymphosarcoma and lymphadenoma, the effects of arsenic on the latter often being to cause still greater resemblance to the former. Dr. Leslie thought that when the true pathology of lymphadenoma came to be written, it would be classed among organismal diseases, and stated that the study of abnormal cases tended greatly to support this view. Dr. Pitt gave the results of the examination of a large number of cases, and inclined to the view that all typical cases came under the sequelae of chronic irritation and inflammation. Dr. Snow having emphasised the importance of defining terms to begin with, Dr. Claud Wilson insisted on differentiating more exactly the various members of this group of diseases. Mr. Shattock pointed out that the same reasons that had been alleged in favour of lymphadenoma being analogous with tubercle might with equal justice be applied to sarcoma or other malignant growth. He pointed out that the true nature of the growth was lymphatic in all cases, not granulation tissue; nor was it sarcomatous in the usual sense; it was an example of a normal tissue in kind that might become disseminated. The President thought lymphadenoma might be grouped between tubercle and malignant disease proper. After Mr. Spencer had replied, the Section proceeded to the consideration of Dr. Auld's paper on Hematogenous Jaundice. Having referred to the work of Minkowski and Naunyn, he gave it as his opinion that as far as they went these authors were right, but he found that a further stage might be arrived at in which a new factor came into play, and the products of the blood destruction coming from the spleen, failed of excretion by the liver, and passing into the tubal circulation, produced a hematogenous jaundice. Dr. Hunter expressed his agreement with the author on many points, more especially as to his idea of the rôle of the spleen, which he had experimentally recognised. Professor Babes (Bucharest) communicated the result of his researches into the Morphology of Pathogenic Bacteria. The

paper was of a highly original and technical character, and it would be impossible to do it justice in an abstract. There being no discussion on this paper, Dr. Hewlett read his note on Ehrlich's Diazo Reaction, and demonstrated some of the reactions in question, pointing out the impossibility of using this test to recognise morphine in as small quantities as 1 part in 10,000. The meeting next proceeded to consider the Fate of Micro-organisms in Inspired Air, communicated by Drs. Hewlett and St. Clair Thomson. The authors insisted that the number of micro-organisms entering the nose was much smaller than was previously thought, and, of those that did enter, the fate was not quite certain in all cases. After a few remarks by various speakers, and the authors having replied, Drs. Danett and Surveyor read a paper on Psoroptosis, in which they contended that there was great difficulty in accepting first the sporozoic theory of their nature, and secondly the production of the immature forms by endogenous cell division. Dr. Westbrook read a paper on the Growth of the Choleraic Vibrio and other Bacilli in Sunlight, in which he found that as a continuation of the well-known results of Roux and others the vibrios varied in their reaction according as to whether they were exposed to air or not. Thus he found that the destructive action of sunlight was confined to those cases in which air was freely present, and that whereas in those cases in which air was excluded the effect of sunlight was to stimulate the organisms and growth by its heat, the virulence was not affected. A paper by Dr. Walters on Pulmonary Hypertrophic Osteo-arthropathy, and a hearty vote of thanks to the President brought the meeting to a close.

SECTION OF OPHTHALMOLOGY.

A DISCUSSION on the operative Treatment of Chronic Glaucoma was opened by Mr. Nettleship. He submitted that it was undesirable to maintain the distinction between typical chronic glaucoma and atrophy with cupping of the optic disc: that the risks of iridectomy in producing rapid deterioration of vision were less than has been supposed; that retarded progress of the disease is often, and permanent arrest not rarely, secured by iridectomy performed early; that it is often right to operate in the premonitory stage of glaucoma; and that iridectomy is nearly always to be preferred to sclerotomy for chronic glaucoma. The discussion was carried on by Professor Fuchs, Dr. Meyer, Dr. Gayet, Professor Panas, Messrs Critchett, Priestley Smith, Swanzy, Little, Adams Frost, Juler, Lee, Williams, Griffith, G. Walker, Treacher Collins, McHardy, and Power. A large majority of the members who spoke were in favour of early operating in cases of chronic glaucoma. Professor Fuchs read a paper on a New Theory of Kryptopsia, in which he gave the result of his observations carried on at a high altitude in the Alps. Messrs. Drake-Brockman, Doyno, and Macdonald made remarks. Mr. Bleskerson read a paper on The Viter Neglect of the Eyesight Question in Board of Trade Inquiries into Shipping Disasters, a criticism of Mr. Bryce's reply of February 19th to the deputation of ophthalmic surgeons. It was discussed by Mr. Caldwell, Dr. Farquharson, M.P., Dr. Edridge-Green, Messrs. Power and McHardy. The following resolution was proposed by Dr. Farquharson, M.P., and seconded by Mr. McHardy: "That effort should be given by the Board of Trade to the recommendations contained in the report of the Committee of the Royal Society on Colour Vision." Dr. Edridge-Green read a paper on Tests for Colour Vision. A vote of thanks to the President was proposed by Mr. McHardy, seconded by Mr. Ernest Clarke, and carried unanimously.

SECTION OF DISEASES OF CHILDREN.

On Friday Dr. J. Kingston Barton introduced a discussion on the Issues of Various Remedies suitable for Children at the Several Ages, urging that sufficient indication was not given in the *British Pharmacopoeia* of the various drugs to which children were peculiarly susceptible, and that an additional list of doses suitable for children should be given having special reference to age. Mr. Barton proceeded to give a list of twenty-seven drugs, which in his personal experience had required either to be increased or decreased much beyond the limits usually recom-

mended. In his experience belladonna was an over-rated drug, and its ill-effects were often more marked than the good it did. He advocated a smaller dose. With regard to a general rule of dosage, he recommended one-twelfth of an ordinary dose for a child 1 year old, and for under that age a reduction reckoned by the months of the child's life. The President, in commenting on the use of chloroform as an anæsthetic for young children, expressed his preference for ether whenever possible. Dr. A. Foxwell said that he agreed with Mr. Barton in advocating small and frequent doses as a rule. Dr. Dawson Williams said that he altogether doubted the age limit in the administration of drugs. In his experience it was useless to give too minute doses; especially in the administration of antiseptics and of mercury he believed in large doses. Dr. Leech (Manchester) pointed out that the doses in the *Pharmacopoeia* represented average doses. Arithmetical calculations were of very little value; physiological considerations were more important. Dr. N. J. Pirard said that the main considerations should be the nature of the patient and of the disease, as well as the purpose for which the drug was employed. After some discussion, the following resolution was carried: "That this Section thinks it desirable that in the new edition of the *British Pharmacopoeia* the maximum doses of powerful drugs suitable for children at various ages should be indicated." Mr. E. Cantley read a paper on the Value of Trephining in Tuberculous Meningitis. Mr. Herbert Waterhouse and Mr. D'Arcy Power continued the discussion. Mr. Nicholas Gratton (Cork) showed an apparatus for Osteoclasis, and Mr. C. W. Cathcart (Edinburgh) showed a simple form of Milk Steriliser. Mr. C. E. Lockwood reported a case of Hernia of the Ovary in an Infant with Torsion of the Pedicle. Dr. J. Walter Carr read a protest against the use of the term "Consumptive Bowels," and Mr. Telford Smith communicated the After-History of Two Cases of Craniectomy. A vote of thanks to the President, proposed by Mr. D'Arcy Power and seconded by Mr. C. W. Cathcart, ended the proceedings.

SECTION OF OTOLGY.

The first paper on Friday was one by Mr. Carmalt Jones on Turbinotomy in connection with Tinnitus Aurium. He had found good results in some cases of tinnitus from removal of the inferior turbinate bone, which he believed acted as a foreign body and kept up Eustachian catarrh. In some cases the deafness was relieved as well as the tinnitus. At times there was troublesome hæmorrhage, but as a rule they did well. Any headache could generally be checked by the bromides. Dr. Bronner said he believed the obstruction was due principally to the hypertrophied mucous membrane, which could be very satisfactorily treated by more simple means; he doubted the necessity of turbinotomy. Dr. Macnaughton Jones said that after careful inquiry from numerous aurists, he had failed to obtain satisfactory evidence of the value of turbinotomy in aural disease, and he certainly considered there was considerable risk from hæmorrhage in the operation. He generally found in these cases some obstruction in the nose, such as deviation of the septum, on relieving which there was generally distinct improvement in the patient. Dr. Fred. Spicer had seen some satisfactory results in these cases, especially as regards persistent tinnitus. Dr. Warden (Birmingham) and Mr. Pritchard considered that the operation was one requiring serious consideration, and inquired as to the after-treatment of the cases. Dr. Pegler showed a large number of microscopical specimens of hypertrophy of the turbinate bones, showing vascular dilatation and unusual hypertrophy. Professor Guye (Amsterdam) read a paper on a not yet described form of Rotatory sensation in Patients suffering from Labyrinthine Disease. In the case mentioned, the patient was suddenly attacked with giddiness and vomiting, followed by deafness in the left ear. rotatory sensations were observed in the direction of the diseased ear, objects appearing to turn like a wheel of the hands of a clock. When the rotatory sensation was slight there was an involuntary movement in the same direction, but when severe the movement was in the opposite direction. Mr. Pritchard and Dr. Thomas Barr (Manchester) agreed with Professor Guye in the great interest attached to these cases of rotatory sensation. Dr. Bronner believed that the vertigo was of vascular origin.

Dr. Edward Law, in the absence of the President, Sir William Dalby, wished to thank Professor Guye in the name of the Section for the very interesting paper he had read. Dr. Macnaughton Jones read a paper on the Various Forms of Menière's Disease. He believed it was one of the few forms of aural disease in which pilocarpin was of use. Professor Guye pointed out that in many cases there was a local cause for the symptoms, which should if possible be removed. Drs. Nourse, T. Barr, Macnaughton Jones, and Mr. Cresswell Baber joined in the discussion. Mr. Pritchard insisted on the proper differentiation of Menière's disease. Mr. Cresswell Baber showed a Dummy for Illustrating Disease of the Sapharynx and a case of Objective Pulsating Tinnitus audible to auscultation, and varying in movements of the ear and pressure on the carotid artery. Mr. Lake read a paper on the Anatomical Relations of the Tympanic Membrane and their Pathological Importance. He showed a large number of specimens proving the connection of the tympanic membrane with the surrounding fibrous structures and the periosteum. Dr. Ward Cousins showed some improvements in Artificial Drums, which were discussed by Drs. Warden, Edward Law, Macnaughton Jones, Mr. Cresswell Baber, and Mr. St. George Reid; the general opinion was that the cotton wool drum was more satisfactory in practice. Professor Guye (Amsterdam) mentioned a case in which the cotton wool drum had proved most efficacious, the hearing being greatly improved. Sir William Dalby pointed out that in some cases the membrane was reproduced, and quoted one in particular where it had been reproduced three times. A hearty vote of thanks to Sir William Dalby and the Honorary Secretaries closed the meeting of this Section.

SECTION OF PHARMACOLOGY AND THERAPEUTICS.

THE attendance on Friday was during the early part of the morning rather scanty, and this is hardly to be wondered at, when one takes into consideration the claims made each evening on the members by the various social functions which have formed so prominent a part of the arrangements of this annual meeting. At 10.30, however, a discussion was opened on the Treatment of Various Affections by Natural Mineral Waters, and by 11 o'clock the attendance was distinctly satisfactory. After a few words from the Chairman, Dr. Mitchell Bruce, a paper was read by Dr. Coffe, on the Waters of Woodhall Spa. This spring is very rich, both in bromine and iodine, these elements being in the form of bromides and iodides, with also a small proportion of iodates. Patients are subjected at Woodhall to treatment both by baths and by internal administration of the waters, such treatment being supplemented, where indicated, by massage and other mechanical measures. Brief notes of several cases were presented, which clearly showed that the waters were powerful therapeutic agents, and required to be used under careful supervision. The next paper was read by Dr. Fox, on the waters of Strathpeffer, a spa rich in sulphuretted hydrogen, and found to be especially useful in cases of rheumatism and similar affections. It is one of the richest springs known in this gas. The Waters of Buxton were then treated of by Dr. Hyde. These waters, which are classed among the indifferent earthy thermal springs, have always held a high place among the British spas. They appear to be useful in a great variety of conditions, and the patients frequenting Buxton are principally of the rheumatic, gouty, and neuralgic classes. A certain proportion of skin affections also appear to be benefited by a course of the baths and waters. Dr. Myrtle next read a paper on Harrogate Waters. There are over sixty springs, of various composition, in this district, and the paper was a valuable addition to our knowledge of some of them and of their therapeutic effects. The list of papers was concluded by an account, from Dr. Tomlins, of the Brine Baths of Droitwich. Most of the above authors took part in the discussion which followed, and observations were also made by Dr. Parsons (Engadine), Drs. Gilchrist, Solly, Hobson (Harrogate), and Gibson. Papers on other subjects of therapeutic interest were then read by the following: Dr. Walters, On the Subcutaneous Uses of Guaiacol; Dr. Snow, On a New Antiseptic named Loretin; Dr. Illingworth, On Talcoids and Talcette: their advantages and disadvantages; and Dr. de Backer, On the Treatment of Tuberculosis by Living Ferments. Time

did not allow these to be fully discussed, and at about this period members appeared anxious rather to participate in the social than the scientific part of the proceedings. The meeting was therefore declared by the President (Sir William Roberts), who was then occupying the chair, to be at an end.

SECTION OF DERMATOLOGY.

THE meeting this day was devoted to the exhibition of living cases and the demonstration of microscopical specimens and drawings. Mr. Malcolm Morris showed an interesting example of Scleroderma with trophic ulcers in an elderly woman; he also exhibited cases of Leprosy, and an unusual one of Tuberculosis of the Skin, which has been described as Lupus Vulgaris Erythematodes. Dr. Crocker showed a case of Morphoea of the Fifth Nerve in a girl; also a good example of Urticaria Pigmentosa. The other cases exhibited by the President were General Scleroderma, Xeroderma Pigmentosum, Alopecia Areata treated by the Oxygen Bath, etc. Mr. George Stoker demonstrated the treatment of Alopecia Areata by Oxygen in the aforementioned case, and in another of his own. To show the effects of the salicylate treatment of Psoriasis Dr. Crocker presented an example in a young man. Among the other cases were the following: Dr. Colcott Fox's cases of Rodent Ulcer of Chest, etc.; and many other examples of rare or unusual conditions were also brought forward by Drs. Eddowes, Stowers, Mackey, etc. Among the drawings and specimens were a series of photographs and sketches of Pellagra, exhibited by Dr. Sandwith (Cairo); Dr. Leslie Roberts (Liverpool) demonstrated sections of Angioma Serpiginosum and of Mycosis Fungoides, the latter in the pre-tumour and tumour stages. Mr. Jonathan Hutchinson showed drawings of various conditions, such as Onychia Maligna, Periungual Chancre, Tinea of the Nails, etc.; and Mr. Jonathan Hutchinson, jun., exhibited sections from a case of Rodent Ulcer, together with drawings of the microscopical appearances of Epithelioma of the Thumb Nail—an extremely rare condition. Specimens illustrating the paper on Pityriasis Rubra Pilaris by Dr. Liddell (Harrogate) were also shown. The Diplococcus of Acute Pemphigus (Beck's 2, inch oil immersion) from Mr. Pernet's case and a section of a Bulla were shown by Dr. W. Bullock. Dr. H. Stowers had a series of interesting drawings representing Melanotic Sarcoma of the Ear, Paget's Disease of the Nipple, Chancre of the Lip, etc. The demonstration of cases brought together a numerous audience, and proved highly successful.

SECTION OF ETHICS.

DR. KNOWSLEY SIBLEY read a paper On State-aided v. Voluntary Hospitals, and Dr. A. D. Williams followed with a paper on the Changing Relations of the Profession and the Public. Dr. Lea then received permission from the President to read a letter received that morning from Cork, which reported farther success on the part of the profession in their struggle at Cork. Dr. Bridgewater next drew attention to the numerous resolutions before the Section which required consideration, and said that there was no doubt that the Section had been most harmonious in its views and temperate in its language. Dr. Cleveland read the rules as to resolutions being sent up to the Council, and then proposed the first resolution: "That it be a recommendation to the Council: (1) To include an Ethical Section in the Annual Programme. (2) To recommend to each Branch the expediency of constituting its Executive Council an Ethical Committee to consider all ethical matters arising within its area, and settle them if possible; or, failing this, to refer them to the General Council of the Association. (3) And it is further suggested to the Council the expediency of their forming an Ethical Committee to receive and report upon such matters as may be referred from the Branches, or otherwise arising." This was seconded by Dr. Broadbent and carried unanimously. The President then proposed: "That in the opinion of this meeting the employment of unqualified assistants in visiting patients is injurious to the interests of the public as well as those of the profession." This was seconded by Mr. George Brown, and carried unanimously. It was next proposed by Dr. Lea, and seconded by Dr. Major Greenwood: "That in the opinion of this Section that any practitioner who wilfully violates generally received rules of

professional ethics should not be met in any professional intercourse whatever, save in a case of urgent danger to an individual patient." This was carried unanimously. It was next proposed by Dr. Potter, and seconded by Dr. Major Greenwood: "That advertising in every shape is highly derogatory to the profession, and that the Council be requested to use every effort to suppress it." Following this Dr. Major Greenwood proposed: "That the Council be requested to take steps to prevent members of the British Medical Association accepting posts in medical aid or other kindred societies, and that in the opinion of the Section no practitioner who accepts office in any society of this kind ought to be eligible for membership of the Association." Dr. Brown (Bacup) and Mr. Hemmings spoke on this; also Dr. Barnes (Eye) and Dr. Bousfield. This was seconded by Dr. Bridgwater and carried unanimously. It was then proposed by Dr. Pearce and seconded by Dr. Lea: "That it be suggested to the Council to open a fund, to be subscribed to by members of the Association, to assist to indemnify bodies of medical men practising in the United Kingdom in their contests against the combined action of the friendly and other benefit societies." This was carried with two dissentients. It was next proposed by Dr. J. P. Henry and seconded by Dr. G. H. Broadbent: "That the Council be requested to communicate with the universities and medical corporations with a view of discouraging their graduates and diplomates from taking office under medical aid associations or undertaking any appointment or engagement calculated to degrade the profession." This resolution was carried *nem. con.* It was then proposed by Dr. Bousfield, seconded by Dr. Broadbent: "That this meeting be unanimously of opinion that a suitable authority should have powers of control over irregular practice of the same kind as those exercised by the Incorporated Law Society and the Inns of Court respectively, and urge the Council to approach the Government with this view, with a preference for this Association as the controlling body." This resolution, after some discussion, was carried. Dr. McNeil next proposed and Dr. Lattey seconded: "That the Ethical Section of the British Medical Association has revealed the urgent need of some practical steps being taken to deal effectively with the present deplorable lack of *esprit de corps* and want of co-operation in the profession generally, of which so much undue advantage is taken by the public. As it is to be hoped that much of the existing undesirable state of affairs arises more from ignorance than deliberate intention on the part of those concerned, we respectfully urge on the Council to take such steps as may direct the attention of professors and teachers in the various colleges and medical schools to the advisability of pressing on their pupils on every suitable occasion the importance of the subject, not only as regards their own, but their future patients' interests. We also strongly suggest that special provision should be made in every medical teaching centre for inculcating this most important part of the duties of the medical practitioner or otherwise to do as they in their wisdom may think fit." This resolution was carried after a good deal of discussion. It was then moved by Dr. Knowsley Sibley and seconded by Dr. Woods: "That the Ethical Section of the British Medical Association considers that medical officers connected with hospitals should be paid by the State." This resolution, after some discussion, was lost. It was then proposed by Mr. Nelson Hardy and seconded by Dr. Hugh Woods: "That, in the opinion of this Section, members of the British Medical Association should not hold office in any hospital which is not really, as well as ostensibly, a public institution; and members of the medical staff at a hospital having pay wards should not gratuitously attend the inmates of such wards." This resolution was unanimously carried, but a further one, attempting to limit out patients of hospitals to such only as had recommendations from medical practitioners, was declared to be lost.

DEATHS IN THE PROFESSION ABROAD. Among the members of the medical profession in foreign countries who have recently passed away are Dr. Meon, Professor of Otolary in the University of Heidelberg, aged 64; and Dr. Nagel, Professor of Diseases of the Eye in the University of Tübingen.

SIXTY-THIRD ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION.

Held in London, July 30th and 31st, and August 1st, 2nd, and 3rd.

THIRD GENERAL MEETING OF MEMBERS—THURSDAY,
AUGUST 1ST.

THE PRESIDENT IN THE CHAIR.

THE next business after the proceedings which appeared in the *BRITISH MEDICAL JOURNAL* of August 3rd was the presentation of the Stewart Prize.

THE PRESIDENT said that the Stewart Prize had been founded many years ago by Dr. Alexander Patrick Stewart, one of the most active members of the Association. [Applause.] It was at least thirty years since Dr. Alexander Stewart was President of the Metropolitan Counties Branch. The prize had been awarded to Brigade-Surgeon-Lieutenant-Colonel D. Douglas Cunningham, M.B., C.I.E., F.R.S., for his work in India. A great deal of that work was very well known to many of the members, especially to those who were interested in bacteriology. In some of the earlier researches on the comma bacillus, Dr. Cunningham had been very active in assisting others to discover some of the pathogenic properties of that organism. He had also made some other very important observations in India with reference to the diffusion of some of the elements of the causation of disease in relation to the temperature of the soil. Altogether he had brought their knowledge of the subject to a higher point than had ever been previously attained. His works really adorned the scientific memoirs not only of India but of their own country. He regretted that Dr. Cunningham was unable to be present, and therefore the Stewart Prize, consisting of an illuminated scroll and a cheque for £50, would be handed to Surgeon-General Cornish on his behalf. He (the President) reminded the meeting that that was the fourth time that the Stewart Prize had been awarded.

Surgeon-General CORNISH said he was very glad to be able to receive this testimony of the appreciation of that great Association on behalf of his friend Dr. David Cunningham, and would have great pleasure in forwarding it to him. [Applause.]

MOTION BY DR. WRIGHT.

Brigade Surgeon-Lieutenant-Colonel TEMPLE WRIGHT said he had the honour of asking permission to move the following resolution:

That this meeting desires to submit a respectful suggestion to the General Medical Council that every medical officer whose name appears in the *Navy List*, the *Army List*, and the *Indian Army List* shall be considered to be still alive and at the post opposite his name. He wished to take that opportunity of thanking their civil brethren for the cordial, persevering, and unflinching assistance they had extended to the members of the army, and especially for sending a deputation in the shape of their Editor to Calcutta, so that he might have the opportunity of saying to the Government what they were not able to say for themselves. When they came home—he was sorry to say sometimes on sick leave—they sometimes spent a good deal of time in reading for the higher diplomas, and when they attained them they sent them to the General Medical Council to be registered. To their great astonishment it was found perhaps that their names had been removed from the *Register*. They were told that it was their own fault, that letters had been sent asking if they were still at the same address and as no reply had been received within six months they were assumed to be dead and their names were struck off the *Register*. That, they thought, was a great hardship. To remove a man's name from the *Register* was the most severe punishment that the General Medical Council could inflict upon a practitioner. When sending the resolution to the Editor for publication in the *JOURNAL* he thought it was only reasonable to send a copy of it to Sir Richard Quain, the President of the General Medical Council. On receipt of his communication Sir Richard Quain had sent for him, and said he hoped that the ensuing meeting of the Association would support and pass the resolution, because

he considered it would materially facilitate the conduct of business in his office. If the meeting passed the resolution he (Dr. Wright) thought that it would effectually put an end to the slur which had been cast upon those gentlemen whose names, through no fault of their own, had been removed from the *Register*. Not only was it an indignity to each individual member of the profession, but it was a source of public danger. In India the appearance of a man's name on the *Register* was the only official evidence that he was a practitioner. Supposing a sharp plunder were to find out that a medical officer had been removed from the *Register* he might object to his evidence being taken; he would say that he knew nothing whatever about his being a qualified man and that his evidence was not admissible. He (Dr. Wright) saw before him many of his friends whom he knew in India, and he was sure they would all bear him out when he said that every judge and every magistrate in India had always said that the medical testimony in criminal cases was the only evidence they would accept as trustworthy.

Dr. MACNAMARA here intimated that the resolution seemed to be thoroughly reasonable, and he thought the President would be glad to see that it was forwarded to the Council, who would take the matter up and do what they possibly could.

The resolution was then put to the meeting and carried.

Communication from Mr. Victor Horsley.—Dr. WARD COUSINS said he had received a letter that morning from Mr. Victor Horsley with reference to a question which had been raised on the previous day, in which he stated: "You conveyed to the meeting that resolutions passed by them were by the Articles binding on the Council. As this is a novel constitutional change in the Association, though a very desirable one, I think that a precise statement on the question is called for. Under these circumstances I beg to ask, first, whether in the past the Council have acted on the assumption that under the present Articles they were in fact so bound? and, secondly, whether they will continue to act in the future in accordance with that view?" He (Dr. Ward Cousins) now begged to give the reply of the Council to those questions. In answer to the first question, the Council had always acted on the principle that the resolutions passed at the annual meeting were in the nature of an instruction to them to carry out the policy indicated by those resolutions, subject to the question whether any such resolutions were in contravention of the terms of the Memorandum of Association, and which would certainly involve personal liability or risk to the individual members of the Council. In answer to the second question, whether they would continue to act in future in accordance with that view, the reply of the Council was, "Yes, they will continue the policy as stated in answer to question 1."

Mr. VICTOR HORSLEY, with all due respect, submitted that those answers were not direct answers to his questions.

Dr. WARD COUSINS said that he could not reply in any other words than in the words of the Council.

Mr. VICTOR HORSLEY said he should like to add a few words of explanation. Those who were present at the meeting yesterday would remember that the President of Council read from the Articles of Association, and he had therefore purposely worded his question, "Whether in the past the Council have acted on the assumption that under the present Articles they were in fact so bound?" If there was any doubt on the point as to whether that ruling was given under the Articles, then he submitted that they ought to have a plain and categorical answer, stating that not only the policy of the Council, but the actions of the Council were wholly conducted under the Articles. This conveyed with it rather more than was supposed. It had been put to him on the previous day that they in annual meeting assembled were like the general meeting of a limited liability company. That was an error; they were not. The power of electing representatives of Council was in the hands of the Branches, and had been given to the Branches when the annual meeting duly assembled constituted the by-laws. Under those circumstances the parallel did not hold. To justify the position he had taken upon the previous day he had consulted an eminent solicitor, and learned from him that as a matter of fact Article 25, although it might be construed very broadly

and very liberally in the manner indicated, nevertheless it did not specifically state the position, and moreover it could not be brought forward in support of that position in a court of law. Again, it was within their own knowledge—and he had asked many senior members of the Association whether it was not the case—that it was the feeling of the members that the Council which managed the affairs of the Association, though they were ready as they had been in the past to hear the resolutions which had been carried by the general meetings, were nevertheless not absolutely bound to carry them out. It was really an answer to that question which he wished to hear, and he ventured with all respect to submit that the plain procedure would have been simply to tell them whether or no the resolutions which were passed at the general meetings were absolutely binding on the Council. It was a simple question of "Yes" or "No."

Dr. WARD COUSINS said he hoped the meeting would support the action of the Council in agreeing that the answer given by the Council was certainly sufficient, and involved every reply which Mr. Victor Horsley had requested. Surely the annual meeting would never expect the Council to act contrary to the Memorandum of Association; and he felt sure the members would agree with the Council in the answer that had been given. Every member of the Council desired in the strictest sense of the word to carry out the directions, suggestions, and recommendations of the annual meeting; they had always done so in the past, and they would continue to do so in the future.

Dr. DOMINGAS said he had always taken a great interest in the annual meetings, and had often attended at great personal inconvenience, because he believed that these meetings were of the utmost importance, and helped to remove the apathy which unfortunately existed in a great measure in the profession outside purely professional subjects. Mr. Victor Horsley's argument was that the Association were not acting as a limited liability company, and for this reason, that a limited liability company at its annual meeting elected its directors, who, if they did not act in accordance with the wish of their members, could be turned out. But Mr. Victor Horsley had very rightly pointed out that the annual meeting of the Association had no power to turn out its Council. That could only be done by the Branches; therefore it was the action of the Branches which was binding on the Council, and not the action of the general meeting. Considering the many thousands in the profession, it was impossible for them to come to the annual meetings in numbers approximating to the number of members of the Association, and it was therefore felt years ago that it would be unfair that they should elect the Council. The question of electing the Council had been settled in the way it had been as a matter of convenience to the profession throughout the whole country and in the colonies who could not come to the annual meetings. But notwithstanding that, the law, namely, the Companies Acts under which the Association acted—for it acted in nearly every respect as a limited liability company—said that if a resolution of which proper notice had been given were brought before an annual meeting and passed, it was binding upon the Council to carry it out as far as it could. [A voice: "As far as the Council can."] He accepted that—as far as the Council could—because the Council might find it impossible to do so. The reason why the word "limited" did not appear at the end of the title of the Association was because certain associations or societies which were formed not for profit had the privilege under the Act of leaving out that word. But with that exception they acted under the Act and under the Memorandum of Association, and of course the one could not be antagonistic to the other.

Mr. VICTOR HORSLEY, in accepting the answer that had been given to his questions, said that he should have been better pleased if that answer had been "Yes" or "No," because, he submitted, to refer to the fact that the Council could only act according to the Memorandum of Association was merely to express a truism. He submitted further that the phrase "to carry out the policy" was different from that used in his question. It was the saving clause, because it meant that the Council was not absolutely bound by the wishes of the meeting.

The proceedings then terminated.

CONCLUDING GENERAL MEETING—FRIDAY, AUGUST 2ND, 1886.

The President (SIR RUSSELL REYNOLDS) in the Chair.

The Address in Physiology was delivered by EDWARD ALBERT SCHÄFER, F.R.S., Jodrell Professor of Physiology, University College (see page 311).

Professor BOWDITCH (Boston, U.S.A.) said that if it were allowable for an invited guest of the Association to move a vote of thanks—[applause]—he esteemed it a very great privilege to move:

That the best thanks of this Association be accorded to Professor Schäfer for his able address in Physiology.

The occasions upon which a busy investigator of natural science turned aside from his chosen work to let his colleagues in the profession know whither his work was tending were not so common that they could afford to pass over in silence, and he knew of no direction in which physiological work had at present been carried on which was of more value to the profession generally. Professor Schäfer had chosen wisely in bringing that matter before the profession; he knew of no branch of physiology in which the field was wider and brighter for new therapeutics. The idea of employing animal extracts as therapeutic agents had not perhaps been received by the profession with quite as much favour as it deserved. That was perhaps reasonable, for it reminded them almost unconsciously of medieval medicine, when every kind of organ and gland was mixed up in a hotch-potch, and applied to the treatment of every conceivable disease. But the scientific study of the active principles of the glands was certainly no less worthy to be taken up by scientific men than the operations of extracting the active principles of bulbs, and roots, and seeds. They had no hesitation in using vegetable medicaments, and there seemed no reason why animal medicaments should not be even more important.

Dr. LAUDER BRUNTON, in seconding the motion, said that Professor Schäfer had chosen a subject for his address which appealed very strongly to everyone, because he had pointed out that in the subject of animal extracts and in the subject of animal internal secretion lay the clue to the treatment of many diseases, some of which they knew and some which were perhaps still unknown. It was all the more interesting to him because he had come straight from the hospital where he had just been prescribing some thyroid extract for a patient whom he had had under observation for several months, and it was most remarkable to see under the influence of the thyroid tabloids the thick heavy lips, the dull appearance and swollen features of the patient resume the aspect of health. There seemed little doubt, however, that the administration of thyroid juice or thyroid in bulk would not replace the action of the normally acting gland, because those patients to whom the thyroid had been administered medicinally fell back again into their former condition, or nearly so, after the administration of the medicine was stopped. They had all been accustomed to look to a great extent to glands as one-sided things, and to have forgotten that the secretion had two sides to it: that it was not only material poured out from the blood into the ducts of the gland, but material was poured back again from the gland into the lymphatics and the blood. What was true of the so-called external glands was probably true of the internal glands, and in all probability the subject which Professor Schäfer had brought before them explained the action of the drugs which many of them had been accustomed to use. When they had administered, for example, a dose of sulphate of magnesia, they had been quite satisfied with explaining the benefit resulting therefrom by the copious flow from the intestine which had succeeded the administration of the dose, and yet in all probability, viewed in the light of the researches which Professor Schäfer had so ably brought them, they had been quite mistaken, and the good resulting from their purgative had been due probably in a much greater measure to the changes in the blood which returned from the secreting glands than to the elimination from the intestine itself. The whole future, both in regard to the administration of new medicines and in the explanation of the action of old, was so enormous that they could hardly guess even now where it would lead them, but they could see how Professor

Schäfer's address pointed the way to a quite new field of medicine, affording them the greatest hopes for the advantage of their patients in the future, and he was sure they would all cordially agree with the motion which had been proposed. [Applause.]

The President, in putting the motion to the meeting, said he was perfectly certain they would all agree with him in thinking that the address was one of the most interesting to which they had ever listened. [Applause.] It showed the real point where the past and the future in therapeutics to a certain extent separated. They had a new sphere before them, not only in physiology, but the application of physiological knowledge to practical and scientific therapeutics.

The motion was carried by acclamation.

Professor SCHÄFER, in reply, said that in thanking the members for the kindness and attention with which they had listened to his somewhat prolonged address and for the manner in which they had received the motion, he desired to make only two remarks. One was that he felt it to be a high honour to have been asked to address them in physiology, and especially a high honour at that meeting, by reason of the fact that his two predecessors in the Chair of Physiology at University College—William Sharpey and Burdon Sanderson—[Applause]—on the two previous occasions of the meeting of the Association in London were also the givers of addresses in physiology; and, in the second place, he felt it to have been an especial pleasure that the vote of thanks had been proposed and seconded by two gentlemen so distinguished in the science of physiology as Professor Bowditch, of Boston, and Dr. Lauder Brunton, belonging to themselves—[Applause]—and more particularly from the fact that, scientifically speaking, they had been life-long friends of his own [Applause].

Reports from the Ethical Section.—The GENERAL SECRETARY reported certain resolutions from the Ethical Section.

[The text of these resolutions will be found at pp. 362 and 363.]

Votes of Thanks.—On motion from the chair, the following votes of thanks were unanimously passed:

That the thanks of the British Medical Association be respectfully offered to her Most Gracious Majesty the Queen for permission to visit her Royal Palace.

That the thanks of the Association be offered to her Royal Highness the Princess Christian for the interest and sympathy that she has shown with the Association in its sixty-third annual meeting; to his Serene Highness the Duke of Teck, and the Committee of the Botanic Gardens, and the Committee of the Zoological Gardens for their kindness in throwing open their grounds to members.

That the thanks of the Association be given to his Grace the Archbishop of Canterbury for his sermon in St. Paul's Cathedral; to the Dean and Chapter of St. Paul's for permission to hold Divine service in the Cathedral; to the Right Rev. the Bishop of Stepney, the Ven. the Archdeacon of London, and to the Rev. Lewis Gilbertson for their assistance in connection therewith; to his Grace the Archbishop of Canterbury, his Grace the Duke of Wellington, his Grace the Duke of Devonshire, his Grace the Duke of Westminster, and to the Most Hon. the Marquis of Salisbury, to the Right Hon. the Earl of Hester, and to Lady Wallace for permission to view their houses and art treasures; to the Council of the King's College and the Committee of Management of the Conjoint Examination Hall for their Governors' permission to use their respective buildings for the purposes of the meeting, and also to the Committee of Exeter Hall; to the Royal College of Physicians and the Royal College of Surgeons for their hospitality; to the Baroness and Mr. Burdett Courts, to Sir Spencer Wells, and the numerous ladies and gentlemen and others who have generously entertained members of the Association; to Lady Priestley and the Ladies' Committee for the kindly interest they have shown in providing for the comfort and entertainment of ladies and members attending the meeting; to the Staff of St. Mary's Hospital, and St. Thomas' Hospital for their hospitality, and the Governors and staff of the various hospitals and infirmaries who have so kindly entertained the members of the Association; to the County Council, the authorities of the Custom House and the Royal Mint, for the trouble they have taken in showing matters of great interest to the members; to the various firms who have thrown open their establishments for inspection by members; to the Committee of St. George's Club, Hanover Square, for opening their club to the use of the members of the Association during the meeting; to Mr. Andrew

Clark and Dr. Isambard Owen, Honorary Local Secretaries, and Mr. George Eastes, Honorary Treasurer, for their successful labours in connection with the organisation of this meeting; to the President and members of the Metropolitan Counties Branch, and to the members of the Association in the Metropolitan District generally, for their hospitable reception.

That this meeting, cordially recognising the distinguished position of the numerous visitors in their respective countries, begs now to tender them the warmest thanks of the Association for their presence, and for the additional interest thus given to the annual meeting; to the Chairmen and Honorary Secretaries of the various Committees for the able and willing help which they have given in rendering the meeting successful.

The President then left the chair, which was taken by Dr. WARD COUSINS, President of Council.

Dr. WARD COUSINS, in proposing:

That the thanks of the Association be given to Sir Russell Reynolds, Bart., F.R.S., for his able and courteous conduct in the chair on the occasion of the sixty-third annual meeting.

—[applause]—said it required no words from him to recommend the resolution to their notice. They had concluded a most successful meeting, and he had no doubt that the effects, both socially and scientifically, would have very far-reaching results. They all felt that the success of that, the largest annual meeting which had ever been held in connection with the British Medical Association, had been greatly due to the kind and courteous way in which Sir Russell Reynolds had conducted all its proceedings. [Applause.]

Sir W. PRIESTLEY, in seconding the vote of thanks, said that it ought not to be given as a mere matter of form, but the members ought to show that it was most sincere and enthusiastic.

The motion was carried with the utmost enthusiasm, the audience rising to their feet and heartily cheering the President.

Dr. WARD COUSINS: Sir Russell Reynolds, will you allow me, on behalf of the British Medical Association, to present you their most grateful thanks for the courteous, kind, and able way in which you have discharged the duties of President. [Applause.]

The PRESIDENT, in reply, said that nothing could exceed the kindness of his friend Dr. Ward Cousins or of Sir Wm. Priestley in the terms in which they had expressed their feelings with regard to himself, and nothing could exceed the kind way in which the members had responded to the motion. He thanked them all heartily for their great kindness and courtesy. [Applause.]

Dr. WARD COUSINS: It is now my duty to tell you that this most successful session, the 63rd of the British Medical Association, has now terminated.

THE ANNUAL DINNER.

The annual dinner of the Association, which was attended by about 700 gentlemen and a few ladies, was held on Thursday, August 1st, at the Queen's Hall, Langham Place. The President, Sir J. Russell Reynolds, Bart., was in the chair, and was supported by the Lord Chancellor, the Lord Chief Justice, Lord Herschell, Sir William Flower, Sir William Mac Cormac, Sir William Dalby, Sir George Young, Sir William Roberts, Dr. Ward Cousins, Dr. Ferrier, Dr. Bridgewater, Mr. Christopher Heath, Mr. Butlin, Sir W. Priestley, Mr. Ernest Hart, Dr. Cleveland, Dr. Pavy, Dr. W. J. Mickle, Mr. Henry Morris, Dr. S. Wilks, Mr. H. Power, Mr. J. H. Morgan, Dr. Felix Semon, Dr. Radcliffe Crocker, etc.

The loyal toasts having been duly honoured.

The PRESIDENT in proposing "Our Guests," said they were honoured on that occasion by the presence of gentlemen who did not belong to the medical profession, but who had occupied the very highest position in their own. On his right was the present Lord Chancellor. [Cheers.] On his left a few moments ago, but who was obliged to leave, was his old friend, Lord Herschell, late Lord Chancellor. [Cheers.] They also had had present the Lord Chief Justice, and they still had with them Professor Stokvis, of Amsterdam—[cheers]—Dr. W. W. Keen, of Philadelphia—[cheers]—and his old friend and colleague, Mr. Christopher Heath, President of the Royal College of Surgeons. [Cheers.] They were all exceedingly delighted to see those gentlemen, and would

join in most cordially drinking their health, and thanking them for being present on that occasion. [Cheers.]

The toast was duly honoured.

The LORD CHANCELLOR (Lord Halsbury) who had a very hearty reception, said: Mr. President, ladies, and gentlemen, conscious as I am of my own weakness I am more deeply impressed with it on the present occasion than perhaps is common to me. I find myself called upon to return thanks for the "Guests," which is in itself perhaps if one is only expected to say we are very much obliged to you, not a very difficult thing to say, though I have observed in the course of my experience that the most difficult thing that an orator can ever accomplish is to sit down. [Laughter.] But my difficulty arises in this way: I find myself associated with four other distinguished persons. [Laughter and cheers.] My excellent and distinguished friend, the Lord Chief Justice, is conspicuous by his absence. My excellent friend, Lord Herschell, appears equally to have disappeared, and then I am encountered by names from the east and from the west, not to mention the most distinguished of all, the centre of what I might call scientific life, the gentleman who represents the central office of this great—what shall I call it?—pursuit of humanity?—[laughter]—investigation of science? [Laughter.] I leave it to the intelligent auditor to choose. I can only say that we are deeply indebted to the kindness which brought us here. I see on your artistic card that there are offerings being made to Esculapius. I rather think Esculapius is making offerings to us on this occasion, and we are very glad to receive what you have been kind enough to bestow. There are other speakers who are to follow me. When we have an important case in a court of justice a gentleman gets up and tells you what the case is about. If you have ever heard it, and have not been instructed in the mysteries of the profession, I will undertake to say you have not the least notion what it is all about when he has sat down. [Laughter.] Then those who are charged with the more important function of persuading their fellow creatures, and telling them not only what it is about but which way they ought to decide it, get up and explain more distinctly the question that is about to be entered upon. Now I have performed the first part of my function. [Laughter.] I will undertake to say that no one will give an intelligible opinion of what I have been talking about. [Laughter.] I leave to my excellent friends who are to follow me to give you a more distinct idea than I can beyond this, while I do heartily and sincerely tender my gratitude to you for the kindness of your President and those who have been good enough to give me an invitation. I have enjoyed your company, I have enjoyed your banquet, and hope I may enjoy it again. [Cheers.] I think when I have sat down that is the one intelligible sentiment that I expect or wish you to carry in your minds. [Laughter and cheers.]

Professor Stokvis (Amsterdam) said it was with the greatest pleasure that he rose to fulfil the duty which was laid upon his shoulders by the Lord Chancellor of speaking a few words in the name of the foreign medical men who were attending on that brilliant occasion. He was sure they would scout him if he did not do what they all expected he would do, that was to express their best and heartiest thanks, not only for the kind invitation sent them, but especially for the splendid reception which had been given them. [Cheers.] Of course, their expectations were rather high—[laughter]—but he might say that their highest expectations had been surpassed by the hospitality which had been shown to them in London. He could assure the Association that their foreign guests were very glad to have the opportunity of being present, not only at their general and sectional meetings, their dinners and garden parties, but also of learning that great practical science and indefatigable application which had made so great and had done so much to promote the progress of medicine throughout the present century. If he was asked to which nation the palm should be given for most promoting medical art in the last century he would give it without any doubt to the Anglo-Saxon nation. [Cheers.] In the great work of mitigating suffering from disease and the sparing of human life England was at the head of all nations, and Jenner, Simpson, and Lister were their eternal glories. [Cheers.] By gathering all the professional medical men in Great Britain and the Colonies into

one great Association, one great brotherhood having the same interests, the same difficulties, the same aspirations, a brilliant example had been set, which he hoped would be followed by medical men throughout the world, seeing that it offered one of the most important levers for the elevation of their profession and the advancement of medical science. On behalf of the foreign guests he begged to thank most heartily their good hosts. [Cheers.]

Dr. W. W. KEEN (New York) said they had been told by the Lord Chancellor that the most difficult thing for a speaker to do was to sit down. He found most certainly that the next most difficult thing for a speaker to do was to get up. [Laughter.] It was bad enough to make an after dinner speech in his own country, but in England and with that distinguished assembly before him, he could assure them that it was with great trepidation that he rose to his feet. He felt very much like the Irishman who during the American war was wounded and came before the Pension Board to apply for a pension. The surgeon asked him where he was wounded, and he placed his hand directly over his heart. "No, no," said the doctor, "it is not possible, Pat, that you were hit there; it would have gone through your heart." "Faith, sir," says he "and when I was hit me heart was in me mouth." [Laughter.] They had heard the thanks presented to this noble Association by their distinguished guest Professor Stokvis, as representing the Eastern Hemisphere; it was his (Dr. Keen's) pleasant duty to return thanks for his brethren of the Western Hemisphere. Only the other day he met an American friend at dinner at the hospitable table of the President of their Surgical Section—[cheers]—who said to him, "I think I dine with you more frequently in London than I do in New York." [Laughter.] This brought forth a remark from an English friend that the Americans seemed to think nothing of crossing the big pond, to which he (Dr. Keen) replied, as he justly might, "It is no wonder that we can come over here, and do so so frequently, when we have such attractions upon this side." [Cheers.] Though Americans were "prodigal sons"—a good many of them—somewhat over a hundred years ago, yet whenever they did come home he noticed that Englishmen were always ready to kill the fatted calf—[laughter and cheers]—and by reason of it there was great danger—and he had found it so—to their digestion. He could assure them that nothing pleased an American so much as to come to the old home, Old England—[cheers]—to be welcomed by its capacious heart, big enough to hold all of them—yes, and all the world beside. The "Roast Beef of Old England" had been celebrated, but it had given way, with Americans at least, to their appreciation of the old and great English heart. [Cheers.] In saying "English," he meant not only England, but Scotland and Wales and Ireland, and the Colonies as well. [Cheers.] It was very much on the principle of the commencement of the Church Service, which said "Dearly beloved brethren," on the ground that it was not necessary to mention the sisters because the brethren embraced the sisters. [Laughter and cheers.] Another reason why they would come over was because they had all been taught in the English school. [Hear, hear.] When he was a student of medicine he was cradled in Gray's *Anatomy*, he hardened his gums on Watson's *Practice*—that admirable book by the Addition of modern English medicine. [Cheers.] He was guided in his first obstetric case by the light of Ramsbotham's *Obstetrics*, whilst his surgical patron saint was Sir James Paget. [Cheers.] He wished that the members of the Association could come to America, where they would receive as hearty a welcome as the descendants of the old English stock could show them. [Cheers.] He was glad to know that there were many American physicians who were held in just as great esteem on this side of the water as distinguished English physicians were on their side. [Cheers.] They all knew Gross, Da Costa, and others. Only the other day Mr. Heath said of one of their Americans at least that his name was in all their mouths and his button in all their bowels. [Laughter.] Only the other day he saw in the *Boston Medical and Surgical Journal* a proposal which out-Murphied Murphy by far. It was written under the name of Paul Fry, Junior, and was dated in 1865. It related the fact that his ancestor had introduced into American practice, and from that it had spread all over the world, an immense improvement especially in colicotomy—that it was

not uncommonly necessary after having made an abdominal section when the bowels got entangled to make another in order to disentangle them. [Laughter.] He had taken a hint from Nature, and had improved the common practice greatly. His hint was a very simple one. There was the belly button, doubtless, he said, the remnant of a row of buttons that ran up and down—[much laughter]—and in order to induce a return to atavism whenever he had a colicotomy, he made a row of buttons and button holes and simply closed it in that way; so that if the bowels got entangled and twisted up he could readily reopen and disentangle them. [Laughter.] In fact, he narrated as a remarkable proof at that time existing of the truth of Darwinism, that a number of children already had been born of such parents with a row of brass buttons all the way down. [Laughter.] He (Dr. Keen) could assure them, speaking seriously, that he brought to them most hearty thanks for the welcome that had been given them, and that had been as cordial, as widespread, and as universal as the members of the British Medical Association. [Cheers.]

Mr. CHRISTOPHER HEATH said the President of the Royal College of Physicians, who occupied the chair that evening, had been good enough to couple his name with this toast as the President of the sister corporation. The bond between these two corporations had become closer and closer of late years. Standing there as the representative of the College of Surgeons, to which he presumed most of the male members of the Association present belonged, he could only thank them for their hospitality. With regard to the ladies he was in a somewhat awkward position, because he knew for a certainty that not one of them could be at present a member of his corporation. He begged, however, to say as a make-weight, that on the following evening he should have the honour of receiving, he hoped, the bulk of the members of the British Medical Association, and that every gentleman who came was entitled to bring with him a lady. He would go further, and say that to any lady who was a qualified practitioner who would apply to him he would gladly send a ticket so that she might take a gentleman. [Laughter and applause.] He was delighted to hear that sentiment received with so much applause. He would see that tickets were ready, and he should hope to see gentlemen led in by the ladies as well as ladies led in by the gentlemen. He thanked the Association heartily for the way in which the guests had been entertained on that occasion. [Cheers.]

Sir GEORGE YOUNG said the season of congresses was also the season of holidays, and the approach of the holidays had deprived them of the pleasure of listening to Lord Herschell, who had charged him to say, when he was obliged to leave, that if he had known he was to make a speech he would on no account have failed in his duty, but that he had made an engagement, which he was obliged to keep. The disappointment was theirs, and the difficulty was his (Sir G. Young's), and he would not have ventured to address them in the place of Lord Herschell, but for the orders of their President, whose behests they were all bound to obey. In Lord Herschell's absence he did not mean to make a speech, but he had to propose that which would be considered to be the toast of the evening, "Success to the British Medical Association," and in trying to execute that duty he hoped he should be met with as much indulgence as he required. The British Medical Association was not only a congress, it was much more than a meeting to discuss medical matters, but it was in the light of a congress that they were now called to consider it. It was sometimes asked, What is the justification of these congresses? They, the members of that great profession—the ministers and interpreters of Nature—had to remember from time to time that there was an outside world interested in these matters, but requiring to be specially addressed in popular language, to have their attention called to what was being done and to be told what were the successes of medicine in language which they could understand and was suited to the occasion. By saying "suited to the occasion," he did not mean to refer to the speech of his friend, Dr. Keen, for he did think that so serious a speech about their insides came very badly after dinner. [Laughter.] The use of a congress was this: there were in all professions the seekers and the thinkers, those who discovered new secrets for the benefit of humanity;

there were also the interpreters; and it was as an interpreter that the congress found its place and explained to the world at large what was going on, enabling outsiders who knew nothing of medicine to appreciate what was being done and to admire the success of this great science, this great service to mankind. The British Medical Association was an institution with which he had been familiar for many years; he had been often associated with many members in promoting the reforms which were necessary in medical education in that great metropolis, and he bore testimony to the fact that the influence of the British Medical Association upon the great question of university reform had been beneficial, and had mainly assisted those engaged in endeavouring to promote these reforms, and had been upon the right side throughout. He would recommend his foreign friends, if they had no medical associations in their countries, to go back and found them, for nothing could be better for a great profession than an organisation of that kind, which brought its distinguished members together, enabling them to confer and to set before the world that which they had done for the benefit of the world. Though utterly unable to do justice to the claims of the British Medical Association, he still desired to bear his testimony to its usefulness and to the fact that it had done great things for the promotion of medicine. He gave the toast of "The British Medical Association," associated with the name of its President of Council, Dr. Ward Cousins.

The toast was drunk with enthusiasm.

Dr. WARD COUSINS in responding, said that during the reign of Her Gracious Majesty the Queen all arts and sciences had progressed, but none had done so with greater rapidity than those splendid sciences which they as individuals practised. [Hear, hear.] The Association was holding its annual meeting in the great Metropolis of the country and in the centre of their largest Branch, a Branch which numbered some of the most eminent men in the medical profession in the world, and had been presided over by one of the most eminent physicians of the day, the President of the Royal College of Physicians. [Cheers.] He was glad to think that they numbered within their ranks many eminent ladies, some of whom were present with them that evening. [Cheers.] Twenty-five years ago the organ of the Association sent forth weekly 2,000 copies. He was glad to state that their weekly issue now amounted to 19,000, and that to the genius and to the energy and the long life-work of Mr. Ernest Hart was owing greatly the prosperity of the Association. [Cheers.] The JOURNAL went forth throughout all lands, and was the recognised record of the progress of the arts of medicine and surgery. Beyond that it was received with a great relish by all the individual members of the Association, and poured upon them like a weekly blessing. [Laughter.] In the midst of their arduous labours, worn by the anxieties of practice, they rejoiced to turn to its pages and watch something of the progress of the healing art. He was not going to say that they were carried away by a burst of violent emotion every week over the pages of the JOURNAL, but he could well conceive that many of their associates in all parts of England would laugh at their night bell if they had a copy of the JOURNAL in their pockets. [Laughter.] And then, looking at it from another point of view, he would ask what would become of the experience and research coming from a thousand sources within their ranks? Would it not be lost to posterity if it were not committed to the immortal custody of their colleague, Mr. Ernest Hart? [Hear, hear.] The British Medical Association was once a flickering light; it was now a great illumination; it spoke with an authority that commanded an attentive hearing. Speaking of the Association, it was a grand thing to be able to say to the world that doctors were increasing on every side, for depend upon it a community was blessed that was surrounded by the faculty. [Laughter and cheers.] Still they were coming! If unseen fever were lurking in their midst there was no cause for alarm; as a practitioner said to a lady patient the other day, "Thank Heaven for the progress of the noble arts of medicine and surgery; thank Heaven for the evolution of preventive medicine! There is no cause for alarm, I can assure you. The world is growing wiser every day; help is at hand, and I beseech you to send for me whenever you require my services."

[Much laughter.] The British Medical Association numbered 16,000 doctors, a great army of medical men, and if they could be placed in battle array they would cover many a mile. He would ask them rather to conceive of these men as an army scattered throughout the world, fighting with human pain and human suffering. He knew there were many who said their organisation was not perfect. This might be so, but of this he was confident, that the day might not be far distant when by a superior form of courtesy and a more universal brotherhood, a medical millennium might dawn upon the world. For sixty-three years the Association had upheld the high purpose for which it was established—sustaining the honour and dignity of the profession, and tending to their consolidation and unity. They expected to fight a good many foes, but he could assure the members that the Association would ever endeavour to sustain the honour and dignity of the profession, and that its moral power would soon be universally recognised, and its voice would become the voice of a united profession. The Association brought them into closer union with the whole medical world. Let them foster the hope that the grand march of international science would help on international goodwill, a force stronger than bayonets or artillery; and while the old weapons were rusting in their scabbards and modern weapons were growing too deadly to be used, let them hope that the gentle influences of moral right and higher sympathy would at length attain a universal victory. [Cheers.]

Sir WILLIAM PRIESTLEY, LL.D., M.D. (President of the Metropolitan Counties Branch), in proposing "The Health of the President," said in doing so he felt very much in the position of a manservant who was most anxious to enter his service, and began by assuring him that he (Sir William) had a very good character. [Laughter.] If anybody ought to be capable of saying anything about their worthy President it was himself, for it was only a few days ago that Sir Russell Reynolds was reminding him of their acquaintance more than forty years ago. That was a long time to look back upon, and yet he had learned in those days to esteem and regard their distinguished President, and that feeling of reverence had grown in more mature years into that of the warmest affection. They all knew that Sir Russell Reynolds was distinguished alike as a scholar, as a gentleman, and as an accomplished physician. His amiability had been such that he could not have made a single enemy, and he (Sir William Priestley) had watched his advance very much as a younger brother might watch the advance and the culmination of the great career of an elder brother, and no man deserved more the respect of his brethren than did their President. [Cheers.] The best possible tribute to his excellence was the fact that he should have been chosen by that very particular assembly, the Comitia of the College of Physicians, to be its President. [Cheers.] If anything more was required to recommend the toast it would be found in the excellent opening address delivered by the President, the unbounded hospitality that he had displayed to the members, and his invariable urbanity to all who came in contact with him. He gave them the toast of the President of the Association, Sir Russell Reynolds.

The toast was drunk amidst long and continued cheering.

The President said he was exceedingly obliged to the members for the kind manner in which the toast had been proposed by his old and affectionate friend Sir William Priestley, and received by the members. He was very glad that the Association had met under such favourable circumstances. It was his pleasing duty a year ago to invite, on behalf of the Metropolitan Counties Branch, of which Sir William Priestley was the head, the Association to meet in London. It had met in London, and it was a very good thing that it had done so; for he was not quite sure that twenty-three years hence, if London grew and the medical profession grew at the same rate that it had done during the last twenty-three years, that even London would know where to put the Association. They would have to resort to open air meetings, for no building would contain them. [Laughter.] He thanked them most heartily for the reception they had given him, and for the kind way in which the toast had been proposed and responded to.

During the dinner an excellent selection of music was given by the string band of the

ANNUAL MUSEUM.

[SECOND NOTICE.]

THE ANKER CHEMICAL COMPANY (32, Snow Hill, London, E.C.) showed their Petroleum Emulsion, a preparation containing a highly purified petroleum oil combined with the hypophosphites, lime and soda. The oil used in this emulsion is taken from selected wells, and so purified by special manipulation as to be deprived of taste and odour and rendered acceptable to both palate and stomach, while retaining unimpaired and in a concentrated form all the virtues of the crude oil. It mixes readily with water, milk, wine, or other liquids. In many forms of disease it will be found an efficient substitute for cod-liver oil, while its antiseptic properties render it of even greater value in diseases of a bacterial nature.

ANGLO SWISS CONDENSED MILK CO. (Cham, Switzerland; 10, Mark Lane, London, E.C.) exhibited their Ideal Milk, a concentrated product of pure milk, enriched 20 per cent. by the addition of pure cream, not sweetened, but preserved solely by means of sterilisation. Condensed Milk, Milkmaid Brand, prepared in Switzerland, containing all the cream of the original milk. Condensed Milk, Milkmaid Brand, prepared in England, containing all the cream of the original milk. Condensed Milk with Cocoa, Milkmaid Brand.

THE APOLLINARIUS COMPANY showed their well known Apollinaris water, a pure, natural, mineral water springing from a deep rocky source situated in the valley of the Ahr, Rhemish Prussia, highly effervescent, and bottled only with its own natural gas. Its perfect purity was recently certified by a report of the Special Committee of the Académie de Médecine de Paris, finding it absolutely pure and free from disease germs. They showed also Friedrichshall Water. This favourite aperient mineral water was exhibited under novel circumstances, the samples being drawn from the new spring. The Friedrichshall spring had of late afforded indications that the combination of saline deposits was becoming partially exhausted. Fresh borings in the neighbourhood opened a new spring, which compares favourably with the old Friedrichshall water of the old spring. The taste of the water is singularly pleasant and wholesome, and enables it to be used either as an occasional or habitual aperient.

Messrs. ARTHUR AND CO. (69, Berners Street, London, W.) exhibited new medicinal preparations made in accordance with suggestions and prescriptions of eminent members of the medical profession. Lime and Iron (Mist. Calcis Chlor. cum Ferro), a neutral, non-saccharine, non-astringent, and sterilised preparation, designed especially for children and patients whose digestive powers are feeble. Mist. Calcis Chlor., a neutral solution of lime of chemical purity, prepared with sterilised water. Tannopumilone, a compound of pure crystallised gallic acid with the limonene of oleum pini pumilionis dissolved in absolute alcohol. Iodoglycerol, a non-irritating solution of iodine, intended as a substitute for the P.P. liniment. Lin. Pinus aceticum, a strong, stimulating teredenthinate emulsion of a creamy consistency. Oleum Morrhuæ Etheris, a clear, limpid preparation of oil and ether, which is more palatable than the turbid mixtures usually made. Lotio Pielis Carbonis Co., a remedy for nettle-rash, etc. Lotio Capitis, a scalp tonic for falling hair. Lotio Furfuris, a scurf lotion. Ung. Hamamelidis Co., an ointment for hæmorrhoids, put up in collapsible tubes with detachable introducing nozzle. Massage Urgent, a deodorised and softened form of oil, thymolene, which does not require previous melting. Sedative Snuff as prescribed for influenza and catarrh. Ung. Menthol Co. Ung. Sedativum, two nasal ointments prepared with a neutral and non-irritating basis containing adeps lane. Tongue Cloths of Japanese paper; they are very cheap, and obviate the necessity of washing those of linen. Staining Fluids for Bacteriologists. The Antiseptic Handkerchiefs for patients with phthisis, influenza, etc., to be burnt after use and thus prevent the dissemination of tubercle bacilli, etc. Chloralase, in 3 grain capsules. Iodo-tannin Wine, a substitute for cod liver oil. Enema Nozole, for the self administration of enemata. Liq. Auri Brom. Arsenatis. Liq. Auri Brom. Arsen. Mercurialis. Liq. Argenti Arsenatis. Liq. Podoph.

Messrs. W. BARTLETT AND SONS (53, Gresham Street, E.C.) exhibited Surgical Needles of all descriptions and for all purposes.

THE BERTHON BOAT COMPANY, LIMITED (Romsey, Hampshire), showed the Portable Hospitals, which are constructed like the Berthon Boats, and being collapsible they are compressed for travelling into a very small space. It is claimed for them that they have perfection of ventilation, and their double walls and roof make them cool in summer and warm in winter. About fifteen minutes is enough to erect one 18 or 20 feet in diameter.

Messrs. LEONARD W. BICKLE AND W. BARKER exhibited an Improved Bed for Medical and Surgical Cases, which in surgical cases can be raised to height of operating table, and any desirable angle obtained. It saves disturbance of patients before and after an operation, and gives great comfort in after-treatment; it also saves patient mental worry of being put on to a table; does away with all disturbance of patient's room; gives inclined plane for treatment of fractures, joint disease, dropsies, etc., and is especially useful in gynecological cases and ordinary midwifery.

THE BRITISH CASTOR COMPANY, LIMITED (47, Victoria Street, Westminster, London, S.W.) exhibited Mitchell's Tasteless Castor Oil, guaranteed pure, cold drawn, and free from any injurious treatment, as manufactured in England.

Messrs. BURGEOYNE, BURBIDGES, AND CO. (Coleman Street, E.C.) exhibited Salicylic Acid, Salols, Carbonates, Bismuth Phenols, Disinfectants soluble in water, and various preparations, as prepared by Dr. F. von Heyden's successors in Radebeul, near Dresden; Chlorobrom (Burgoyne's), Ch. Chantaud's Sedlitz, Malto-pepsyn (Hazen Morse), Red Cross Lint, Medical Lint, Dispensary Lint, Red Cross Antiseptic Wool and Lint, Red Cross Bandages, Red Cross Antiseptic Gauze in cartons.

Messrs. CARNICK AND CO., LIMITED, 24 and 25, Hart Street, Bloomsbury, London, showed their Beef Peptonoids: Concentrated beef, milk and gluten, in the form of powder, sterilised and partially peptonised, constituting a most nutritious, palatable, and easily digested food-combination. Liquid Peptonoids: A solution of the beef peptonoids powder, entirely digested, with the addition of the minimum amount of alcohol necessary to make a staple compound. It is extremely palatable, and this combination of a stimulant with easily digested nutriment has been found very successful. Liquid Peptonoids with Coca: Each fluid ounce is said to contain the extract of 30 grains coca. Peptonoids, Iron, and Wine: Beef peptonoids digested and dissolved in sherry, pyrophosphate of iron. Cod Liver Oil Milk. Soluble Food: A milk-wheat food. The starch of the wheat is converted into dextrine and soluble starch. The milk is sterilised and partly digested with fresh extract of pancreas, and milk sugar is added to bring up the saccharine constituents to the equivalent in human milk. Oozol: Oozal Pocket Inhaler, etc.

Messrs. CASSELL AND COMPANY, LIMITED (Ludgate Hill, London, E.C.) showed copies of all their Medical and Clinical Manuals for the use of practitioners and students. Besides these two well-known series of works they also had on view Mr. F. Treves's new and important work *A System of Surgery*, many monographs on special subjects; also the numbers of the new and enlarged series of *The Practitioner*, edited by Mr. Malcolm Morris.

THE GATLEY ABBEY NATURAL SALT-WATER COMPANY (Digby, Lincoln) exhibited samples of their Seltzer Water.

THE CERES AUTOMATIC LETTER AND CARD FILLS had on exhibition their files for filing away letters and documents.

THE CONDAL WATER COMPANY exhibited their Water.

THE CHEMISTS' AERATED AND MINERAL WATERS ASSOCIATION, LIMITED ("Camwall"), showed Aerated Waters manufactured for ordinary use in siphons and bottles. Soda, Potash, Lithia Waters, etc., manufactured according to the *British Pharmacopœia* for medicinal purposes in siphons and bottles; and Syrups manufactured from pure essences of fruits.

Messrs. THOMAS CHRISTY AND CO. (25, Lime Street, London, E.C.) showed their Adeps Lane S.W.K., which it is claimed consists only of the low melting soft and supple constituent parts of pure woolfat, and it melts at 96° F. Other wool fats, from which the harder constituent parts

have not been removed, melt at a higher temperature. Antrophors for the treatment of diseases of the urethra and prostate. Flexible spiral springs coated first with an insoluble rubber covering to guard against irritation to the mucous membrane, and to prevent decomposition of the medicament by the action of the metal spring. The soluble medicated mass covers the first insoluble coating, and when inserted into the urethra or prostate it gradually melts, and is absorbed by the mucous membrane. Antrophors or Coated Spring Boudies, which are supplied medicated with Argent Nit., with Cocaine, Boric Acid, Caffeine, Cocaine Hydrochl., Copper Sulph., Ichthyol, Ichthyol and Cocaine, Iodoform, Microbene, Resorcin, Resorcin and Zinc Sulphate, Resorcin and Pannin, Resorcin and Ichthyol, Sozodolol, Tannic Acid, Thallin, Thallin and Cocaine, Thallin and Zinc Sulphate, Zinc Sulph., etc. Analgin: its chemical formula is $C_9H_7-NO_2$, $-NHCOO.C_6H_5-N$, the chemical name being orthoethoxy- α -monobenzoyl-amido-quinoline. Benzoinol, a pure, staple, and bland petroleum oil, medicated with benzoin, and especially adapted for use as a spray on mucous surfaces, both alone and in combination with various drugs, such as menthol, cubeba, tar, pine needle oil, eucalypti acid, etc. Cachets (Morstadt): These wafer capsules have many advantages. They are very easily swallowed; the remedy rendered tasteless by their use, is easily liberated in the stomach in a pulverulent condition. The cachets consist of sunk discs of rice paper, which, when filled, are merely moistened at the rims with water, by means of a suitable damping arrangement, and closed, after which they adhere firmly together. Christia: This is a substitute for oiled silk, gutta serena tissue and similar materials; it is claimed that it does not become sticky when heated. Christia Lint is a high quality lint with an impermeable backing. It is not only impermeable to, and unaffected by, hot and cold water, but is also unaffected by oil, grease, spirits, and chloroform. Christia Lintine: This substance is quite similar to Christia Lint, but its absorbent powers are greater. Cushman's Patent Menthol Inhaler, a most convenient instrument for the application of menthol to the throat and nose. Extract Alstonie Constricta Lq., antiperiodic and nerve stimulant, combining the properties of quinine and strychnine. Extract Aplopappus Liarata Lq., a new remedy for gonorrhoea and gleet. Extract Boldo Lq., for atony of various organs, when quinine cannot be tolerated, or in chronic hepatic torpor. Extract Burma Gookeroo Lq., diuretic, demulcent, antispasmodic in dysuria, colic, gonorrhoea, and irritation of the urinary organs. Extract Eschscholtzie Calif. Lq., soporific, analgesic. Extract Eugenia Cheken Lq., an aromatic, astringent, expectorant and antiseptic. Extract Haplopappus Baylahuen Lq., used as an internal stimulant for weak digestions, and as an emmenagogue; also said to be a remedy for diarrhoea. Extract Kola Lq.: Kola contains 2.348 per cent. of caffeine, also theobromine; a powerful nerve stimulant, used for fatigue, indigestion, dipsomania, etc. Extract Kurehi, for dysentery and hemorrhage; anthelmintic properties are also attributed to it. Extract Nardostachy's Jatamansi, used in India for epilepsy, hysteria, and convulsions. Extract Pao Persiro Lq., febrifuge and antiperiodic. Extract Pichi Lq., used in urinary and kidney troubles, in chronic catarrh of the bladder, and in stone; also in dyspepsia and dropsy. Extract Pseudie (Jamaica Dogwood) Lq., a calming sedative; the Fluid Extract is said to have been used with benefit in cases of phthisis, miners' bronchitis, dry catarrh facial neuralgia, sleeplessness, and sciatica. Extract Syzygii Jambolani (Jambul), a remedy for diabetes. Kola and Kola Preparations (Kola, Prepared Pure, Kolatina, Kola Champagne (non-alcoholic), Kola Chocolate, Kola Cocoa, Kola Fozir in bulk for dispensing, Kola Tablets, Kola Tonic, Kola Wine): Kola contains 2.34 per cent. of caffeine and theobromine, as compared with 0.70 to 1.50 per cent. in coffee. Oleum Gynocardie (Chaulmugra) for rheumatism, rheumatic gout, psoriasis, phthisis, and various skin diseases. Oleum Jatrophae a purgative, having a pleasant almond-like taste. Oleum Palma Christy—Oleum Ricini Aromaticum (Dr. Standke): This is castor oil, which, by a process of Dr. Standke, is changed in its taste, sweetened, and aromatised. Ruby Christia, for the illumination of dark-rooms for photographic purposes; it successfully cuts off the actinic rays of light. Three qualities are supplied, paper, cotton, and silk,

each possessing the advantage of being transparent, flexible, and safe. Stearns's Cascara Aromatic, a fluid extract of prime cascara sagrada, from which the bitter principle has been removed and the product aromatised and sweetened. Stearns's Essence Pepsin (Dike's), a liquid digestive. Stearns's (Dike's) Pepsin, in scales of the highest digestive power (1,3000), prepared by a new and original process. Stearns's Wine of Cod-liver Oil, a new and original preparation, which is said to contain 15 per cent. of pure cod-liver oil, as represented by its active medicinal constituents, morrhaine, butylamine, amylamine, iodine, bromine, and phosphorus; each fluid ounce of the wine contains 4 grains of peptonate of iron. Succus Caricæ Papaye, for tapeworm and for indigestion, dyspepsia, etc. Succus Cinerarie Marit. Syrupus Burma Gookeroo, diuretic, demulcent, anti-spasmodic. Tincture Lachnanthis Tinctoria, used in pneumonia, nervous and typhus fevers, diseases of the brain, laryngeal cough, hoarseness. Tincture of Lycopodium has a special action on the urinary organs and liver, relieving spasmodic retention of urine and catarrh of the bladder; in constipation attended with flatulence, in enteritis in infants, in chronic passive bronchitis, and in chronic pneumonia. Troch. Cocaine-Christy. Troch. Euphorbia Pilulifera: Euphorbia was first introduced for asthma, but since its introduction it has proved of great value in cases of coughs, colds, and throat affections generally. The lozenge now presented proves a most convenient form in which to administer the drug. Troch. Kola: These are best taken between the meals, and not immediately afterwards. Troch. Menthol, for coughs, colds, huskiness, sore throat, and affections of the throat and chest. Troch. Papain and Cocaine. Troch. Papaw, made from the dried juice of the papaw plant. Troch. Pichi, said to have a soothing effect upon the system. Troch. Salix Nigra. Stearns's Hæmoferrum (blood iron), a natural proteid compound of iron, aseptically prepared from fresh bullock's blood; it is very soluble, of sweet odour, of pleasant taste, neutral in reaction, and is non-styptic, non-irritating, and non-constipating. Hæmoferrum (Stearns') is offered only in "pilloids" (each containing 3 grains), a new form of medication of lenticular shape, being simply the powdered drug enveloped in a transparent, extremely soluble, continuous coating.

The CHURCH LADS' BRIGADE exhibit consisted of Medical Officer's Equipment, the C.L.B. "Regulation" Stretcher, and Ambulance Material. The C.L.B. Medical Staff Corps has been established to teach the lads first aid and ambulance, for which certificates are given—third class first year, second class second year, and first class third year.

Messrs. COOPER and Co. (80, Gloucester Road, South Kensington) showed in Room B, Exhibit No. 10, a few of their specialities, namely: Liquor Quinine Salicylatis: This is a very useful preparation, salicylates of quinine in this form being more readily absorbed than when administered as powders, pills, or suspended in a mixture. Cachets, which were being shown in England for the first time. Cachet Machines, an improved style, being specially adapted for their cachets. Sinapine Tissue: this is an extremely convenient form of plaster. Specimens of Pills. Pastils of Cocaine, Red Gum, Cascara Sagrada, Sulphonal, Aconite, Bismuth, Pepsin, Compound Sulphur, Phenacetin, etc.

Messrs. CURRY and PAXTON (195, Great Portland Street) showed Ophthalmoscopes, after Couper, Morton, Juler, Lawford, Jessop, Cross. Perimeters, after McHardy and Priestley Smith. Optometers, after Couper, Doyne, Tweedy, etc. Trial Cases, with Lenses mounted in rings and unmounted. Trial Frames as designed by Landolt, Lang, Rockliffe, Toss-will, etc. Eyeglasses for Astigmatism, after Dodd, fitted with the new system of bifocal lenses. Eyeglasses of the horizontal pattern for constant wear. Spectacles of the latest and most approved forms. Electrical Branches for Ophthalmoscopes.

Messrs. Down Bros., St. Thomas's Street, Borough, S.E., showed a selection of their instruments, including Aseptic Surgical Instruments, and Aseptic Cases of Instruments suitable for all departments of Surgery. Anatomosis Buttons in various forms designed by Dr. J. B. Murphy (Chicago). Decalcified Bone Tubes, etc., by Dr. Paul. Mr. Mayo Robson's Bobbins, and Senn's Plates. Anæsthetic Apparatus: New Inhaler, by Mr. Norman Porritt; Ether Inhaler with double

water jacket, by Mr. Tyrrell; The Rumbold-Biroh Gas and Ether Inhaler; Celluloid Inhaler for Ether and A. C. E. Mixture, by Dr. Silk; Transparent Face Pieces, by Dr. Silk. Antitoxin Syringes: Various models, including Debove's and recent much improved model, by Dr. Roux. Antrectomy Instruments: Recent models, by Mr. Bark (Liverpool), Mr. Arbuthnot Lane, and Mr. Charters Symonds. Artery Forceps: Mr. Greig Smith's new model. Aseptic Furniture for the operating theatre, and the wards of hospitals, also for surgeon's consulting and private operating rooms. Cage for undescended Testicle, by Mr. Watson Cheyne. Cleft Palate Instruments: Complete aseptic cases including designs by Mr. Davies Colley, Mr. Durham, Mr. Mason, and Mr. Smith. Craniectomy Instruments: Forceps, by Mr. Victor Horsley and Mr. Arbuthnot Lane; Trephines, by Mr. Walsham; and Trocars, by Professor Macewen; Mr. Arbuthnot Lane's V-shaped Gouges. Colotomy Truss, by Mr. Clement Lucas. Dr. Paul's Glass Tubes. Diagnostic Bag designed at the suggestion of Mr. Arbuthnot Lane. Dissector and Probe, by Mr. Watson Cheyne, for isolating nerves and veins in fine dissections. Ear Instruments: New designs, by Mr. Cresswell Baber (Brighton), and Dr. Adolph Bronner (Bradford); New Spare, by Mr. Ballance, and Osteotome for cutting through the tympanic ring, by Mr. Ballance; New Auriscope with electric light, by Dr. Hopwood; and new Polypus Forceps, by Mr. Wyatt Wingrave. Electric Light Apparatus: Latest improved models, including the Washington Isaac's Search Light and new Urethroscopes, by Mr. Burghard. Exploring Syringe combined with Director, designed by Mr. Arthur Pritchard (Clifton). Eye Instruments: Aseptic sets in cases; Aseptic Douche, by Mr. Lawford; Metal Frames to cover Dressings, by Dr. Adolph Bronner and Mr. Stephenson; Nasal Duct Probes, by Mr. Simeon Snell. Trachoma Forceps, by Mr. Stephenson; Mr. Simeon Snell's Platinum Cautey; Self-supplying Syringe for Lacrymal Duct, by Mr. Lumley. Gall Stone Forceps, by Mr. Anderson, and Gall Stone Scoop, by Mr. Morison (Newcastle-on-Tyne). Hernia Needles, by Professor Macewen and Mr. Watson Cheyne. Hypodermic Syringes, latest improved aseptic model, including new patent made entirely of metal, with metal piston in metal case. Hystereotomy Instruments: Broad Ligament Forceps, several new models; Dr. Galabin's Needle for the broad ligaments; Elastic Ligature Instrument, by Professor Pezzi; Péan's Retractors; Jordan Lloyd's Vulsellum. Ice Cups: Sister Louise's A.N.S. Patent Ice Cups in various forms suitable for hospital wards and sick rooms. Intestinal Operation Instruments: Bowel Clamps; Dr. Murphy's Buttons for lateral and end-to-end approximation; Decalcified Bone Preparations, various; Mr. Allingham's Clamp for Inguinal Colotomy, and Mr. Morison's Clamp Forceps combined with tube; Dr. Paul's Truss for extension of rectum. Laryngeal Instruments: Dr. Adolph Bronner's Aseptic Syringes; Dr. Watson Williams's Syringe for subcutaneous injection; Forceps by Moritz Schmitz. Ligatures and Ligature Holders, aseptic, new portable model, by Mr. B. Alcock of Burslem. Lymphectomy Instruments: Dr. Arnison's Guarded Chisels; Forceps, by Mr. Victor Horsley and Mr. Arbuthnot Lane. Lithotripsy and Lithology Instruments: New forms of Lithotrite, by Mr. Minton, of Cairo; Mr. Golding-Bird's Evacuator. Mastoid Instruments: New models by Mr. Ballance and Mr. Arbuthnot Lane. Nephrectomy Instruments, by Mr. Clement Lucas. Nose Instruments, by Mr. Cresswell Baber, Dr. Adolph Bronner, and Mr. Charters Symonds. Oesophageal Instruments, by Mr. Charters Symonds. Operation Bag, by Mr. Greig Smith. Operation Coats and Dresses for the operating theatre capable of being sterilized. Operation Table, portable, by Mr. Jordan Lloyd. Ophthalmic Atlas, by Mr. Frank Hayden, for recording diagnoses. Ophthalmoscopes: New models, by Mr. Simeon Snell, and Down's Patent Modified Morton's, with additions by Mr. Wark Dodd. Ovariectomy Instruments: Trocar with wings to open inside cyst, by Mr. Stannmore Bishop; Pressure Forceps, various forms, by Mr. Greig Smith; Abdominal Suture Needles, by Dr. Cullingworth. Peritoneum Forceps, by Mr. Greig Smith. Pocket Case, Aseptic, by Professor Calhoun and Dr. Leeson. Post-Nasal Instruments: Curettes, by Mr. Ballance, Mr. Golding-Bird and Gottstein; Mr. Symonds's modification of Lowenburgh's Forceps. Rectal Ointment Introducer, by Mr. E. O.

Ryall. Retractors: Automatic, by Mr. Jordan Lloyd and Dr. Maunsell, also Mr. Watson Cheyne's Retractor for use in Intestinal Operations; Mr. Durham's and other Retractors fitted with Down Brothers' new model handles. Set of Instruments for Operating in Cases of Liver Abscess, by Mr. W. Edmunds. Scalpels in Aseptic Cases, by Professor Macewen, and Mr. Jordan Lloyd's Aseptic Scalpels combined with Raspatories. Spring Compresses for Wounds, by Mr. Lenthal Chestle. Splints on new principle for fractures of the lower extremities, by Mr. Arbuthnot Lane. Sponge Holders: Down Brothers' new registered aseptic pattern. Sterilizers: Cutchart's and Schimmelbusch's for surgical instruments and dressings; also special forms of Sterilizers for catheters, ear instruments, eye instruments, ligatures, etc. Stethoscopes: Dr. Herschell's improved Binaural (Down Brothers' patent), various forms of new patent Chest pieces. Tonsil Guillotines: Improved model, by Mr. Ballance, and modification of Mackenzie's, by Mr. Roper, of Lewisham; Raault's Forceps for excising the Tonsil. Tracheotomy Instruments in aseptic cases, including several new models. Tourniquets: Dr. Samway's Patent Clip and Grapnel Tourniquets. Urethral Instruments made for Mr. Hurry Fenwick for Curvature or Internal Urethrotomy under control of the electric light, as carried out in the distended urethra by means of the aëro-urethroscope; New Electric Urethroscope by Mr. Burghard; Dr. Nicoll's, of Glasgow, new Steel Dilators. Uterine Instruments: New form of Curette, by Dr. Herman; Hegar's Dilators in metal, modified by Dr. Hawkins-Ambler; Aseptic Uterine Sound, by Dr. Horrocks. Vaginal Specula: New forms, by Dr. Arnison, of Newcastle, Dr. Auward, Mr. Spanton, of Hanley, and Dr. Galabin. They also exhibited Surgical Instruments formerly belonging to Dr. Leonard Gillespie, who served as Physician to the Fleet with Nelson in the *Victory*; lent by Mr. H. Nelson Hardy.

Mrs. A. M. DOUGLAS, Inventor and Patentee (Dalkeith House, Leamington), exhibited the "Facile Princeps" Bed, which enables a nurse to remove the sheet on which the patient lies without disturbing or touching him. The operating table in combination with it obviates entirely the necessity of lifting or moving the patient after operating. The whole appliance is marked by simplicity, ease, and strength.

MESSRS. EVANS, LESCHER, AND WEBB (60, Bartholomew Close, London, E.C.) showed Pharmaceutical Products and Specialities of the house, such as Fluid Extracts, Savarasse's Capsules, Evans's Saline, Montserrat Lime Fruit Juice, etc.

MESSRS. FASSETT AND JOHNSON (32, Snow Hill, London, E.C.) showed Medicinal and Surgical, Adhesive, Isinglass, Mustard and Spread Plasters all descriptions in approved forms; Mead's Adhesive Plasters in various sizes; Absorbent Cotton, Lint, Gauze, Bandages, Wool, Jute, Oakum, Oiled Silk and Muslin, Protective Oiled Silk, Catgut and Silk Ligatures, Surgical Dressing Paper, Drainage Tubes, Hospital Oiled Paper, and every variety of Surgical and Antiseptic Dressings, also Compressed Antiseptic Tablets. Seabury's Airtight Aseptic Container (patented) for medicated bandages, cottons, gauzes, etc., which received a special highest award at the World's Columbian Exposition, Chicago, 1893. It consists of wood fibre package into which is incorporated an antiseptic; the package is coated within with antiseptic lacquer, the joints overlap, giving great strength, and are made doubly secure by overlapping label, and further rendered perfectly airtight by lacquering its entire surface. Seabury's Standard Antiseptic Gauzes, prepared with absorbent gauze manufactured expressly for the purpose; every precaution is taken to ensure aseptic conditions throughout the process of manufacture and putting up. They are thoroughly impregnated with the percentage of medication stated upon the label, so that by taking a given weight of gauze the surgeon may know exactly the quantity of antiseptic he is using. Seabury's Sulphur Candles, for disinfective purposes.—They are sold in two forms, the larger candle, in a decorated tin container, holds 1 pound of sulphur, burns for about two hours, and is capable of yielding 300 litres, or nearly 12 cubic feet of pure sulphurous acid gas (SO₂) at normal temperature and pressure. The smaller candle, which is the subject of a recent patent, is in a porous container; the efficacy of sulphurous acid gas for disinfecting purposes is greatly intensified by being generated in a moist state, and

as the water comes into more immediate contact with the burning sulphur in this container, a better result follows.

The FLITWICK CHALYBEATE COMPANY (63, Borough High Street, S.E.) showed their Water from a medicinal spring discovered in Bedfordshire, which yields a chalybeate of the highest therapeutic value, and contains a large amount of iron entirely in the ferric state, with a moderate amount of alumina and small amounts of lime and magnesia, combined mainly with sulphuric acid as sulphates and very marked amounts of the organic compounds derived from peat. The water is of a slaty colour, perfectly clear and bright. The peculiar manner in which the iron is held in solution in the water renders it capable of being readily absorbed and assimilated; it does not affect the teeth nor produce constipation; for anaemia, chlorosis, and general debility it is invaluable. Wilko, a sparkling non-alcoholic pick-me-up, containing some of the natural chalybeate water of Flitwick, and forming an extremely palatable beverage, and a pleasant medium for taking iron, especially suitable for ladies and children.

Messrs. R. W. GRIFFITH AND CO., 13, Eastcheap, London, E.C., exhibited Airoi, Bismuth Subiodide Gallate, an iodoform substitute containing iodine; Gallanol, Gallic Anilide, a non-toxic substitute for pyrogallol acid, recommended in eczema, psoriasis, etc.; Gallobromol, Dibromogallate Acid, an antiseptic and sedative in hemorrhagia; Salol, Phenyl Salicylate, free from uncombined carbolic or salicylic acid; Saccharin, Pure Orthobenzoic Sulphonide, free from impurities; Salicylic Acid and Salicylates, Phenacolin, Sulphenal; Salipyrin, Salicylate of Antipyrin, recommended in influenza and menstrual difficulties; Thiol, a substitute for ichthyol; Thioform, Dithiosalicylate of Bismuth, invaluable in the treatment of wounds and skin diseases; Liquid Pepsin (Dr. Byk), a concentrated and active dissolved pepsin.

The HARROGATE CORPORATION had on show a collection of their Waters, and also Photographs of Baths and Buildings.

Mr. GUSTAV HERMANN, JUN. (Representative of Ichthyol Company, Cordes, Hermann and Co., Hamburg, 20, High Holborn, London, W.C.), was present showing Ichthyol, which is the ammonium salt of ichthyol-sulphonic acid, obtained from a bituminous deposit containing the fossilised remains of maritime animals and rich in sulphur; it is a natural product that has undergone chemical treatment to reduce it to a practical form for employment in medicine. Besides the ammonium salt of the dibasic ichthyol-sulphonic acid, the percentage composition of which is represented by the formula $C_{12}H_{10}S_2O_4NH_4$, the preparation contains water and volatile oil, which communicates a characteristic odour, and cannot be removed without fear of decomposition and destruction of the therapeutic activity.

Messrs. HERBICK AND CO. (39, Snow Hill, London, E.C.) showed their Malted Milk; it is a prepared food for infants and invalids, containing no starch or cane sugar, requiring no cooking or addition of milk, and will, it is claimed, keep indefinitely in any climate.

JOHN AND CO., LIMITED, exhibited their Table Waters, in the shape of a trophy of siphons and bottles, together with illustrations of their laboratory methods. One of their chemists was in attendance to show their various methods of analysis and examination. Among their other specialities is to be noticed their Patent Glass Tubing, which is invaluable for the conveyance of pure table waters. They also exhibited a Model of their Factory.

Messrs. INGRAM AND ROYLE'S show of Waters included Maculap, Carlsbad, Vichy, Grande-Grille, and Hôpital. They also showed Vichy Salts and Pastilles as extracted from the waters.

JAYES' SANITARY COMPOUNDS COMPANY, LIMITED (64, Cannon Street, E.C.), exhibited their Fluid, a sanitary coal tar disinfectant, and non-poisonous. Jayes' Sanitary Powder, a dry disinfectant for cellars, floors, outhouses, etc. Creolin, a refined preparation of Jayes' Fluid. Lano-Creolin Ointment, in collapsible tubes, for wounds, eczema, and skin affections, and for anointing the fingers in examinations. Creolin Surgical Powder, a substitute for iodoform. Creolin Gauze, made with the finest bleached gauze, and impregnated with 10 per cent. of creolin, and used as a substitute for iodoform gauze. Creolin Surgical Soap, for disinfecting the hands be-

fore and after operations, etc. Creolin Capsules, for internal use. Disinfectant, Household, Toilet and Fancy Soaps in all varieties. Symphorol (caffeine-sulphonic acid), a new diuretic, manufactured by Messrs. Meister, Lucius, and Brünning; increases urinary secretion without producing secondary symptoms. They also exhibited some new Medicinal Preparations for the first time: Jayes' Soluble Fluid, an active germicide, giving with water clear solutions, and having otherwise all the properties of creolin and Jayes' Fluid. Lano-Creolin for the toilet. Migraine, a new double salt of antipyrin and caffeine, useful in migraine, sick headaches, and neuralgia complaints. Lysidine, a new solvent of uric acid. Carniferine, an iron salt of phospho-carnic acid, recommended in anæmic conditions, particularly owing to its non-disturbance of the digestion. The Indispensable Automatic Toilet Box and Paper, useful in the interest of hygiene and prevention of infection. Nosophen (tetra-iodo-phenolphthalein), a new iodoform substitute manufactured by the Chemische Fabrik Rheinania. Antinosine, a soluble sodium salt of nosophen, for washing wounds and cavities. Eudoxine, a bismuth salt of nosophen.

The JOHANNIS COMPANY had a stall for exhibiting their Water.

An excellent exhibit of Sanitary Appliances was that of Mr. JOHN JONES (40, Sydney Street, Chelsea, S.W.). We had occasion before to call attention to the various articles manufactured by this firm, the excellence of which is well known.

Messrs. S. KUTNOW AND CO. (66, Holborn Viaduct, London, E.C.) showed their improved Effervescent Carlsbad Powder. This preparation is a pleasant and effective aperient; it will also be found valuable in diseases of the stomach, kidney, liver, and bladder, as well as in diabetes, gout, rheumatism, acid dyspepsia, constipation, and hemorrhoids. Kutnow's Anti-Asthmatic Powder (Polvis Kutnowi Anti-asthmaticus), and Kutnow's Anti-Asthmatic Cigarettes, for asthma, bronchitis, catarrh, influenza, hay fever, and ordinary colds. These preparations consist of a judicious admixture of various herbs, possessing a sedative action upon the lungs and air passages, with potassium nitrate.

The LIQUOR CARNIS CO. (London) were showing their Virol, a preparation which has been devised by the Liquor Carnis Company to supersede cod-liver oil, and also to supplement the heat-producing capabilities of oleaginous substances by the introduction of nitrogenous and bone-forming ingredients. It consists of beef marrow fat from marrow bones which are sawn in sections, and the marrow scooped out. The marrow, when separated, is dissolved at a very low temperature, and afterwards combined with raw eggs, the shells of which are also brought into the preparation by the aid of lemon juice. To this is added the carbohydrate in the form of malt extract. Caffyn's Malto-Carnis, the formula of which is: Liquor Carnis (Caffyn), 66 parts; cocoa essence, 10 parts; ext. malt, 24 parts. Misce sec. art. (L.C.C.). Liquor Carnis Suppositories, a raw beef juice suppository. Caffyn's Liquor Carnis. Marrol: Ox-bone marrow, plus the carbohydrate-extract of malt—in physiological proportions. A palatable substitute for cod-liver oil. This preparation is analogous to Virol, but it is not so sweet, and the fat and proteid of eggs are replaced by ox-marrow, selected partly on account of its easy digestibility, and partly because the red portion of marrow contains hemoglobin and organic compounds of iron and phosphorus. Meat Juice for invalids' and travellers' food. This is a preparation of meat juices, manufactured by the Company. It contains the albumins and albuminoids in their raw condition. Virol sans Sucre, a preparation of red and yellow bone marrow rich in hemoglobin and organic compounds of iron and phosphorus. It is a substitute for cod-liver oil, and constitutes a good form of administering fat.

The LEAMINGTON TOWN IMPROVEMENT ASSOCIATION showed the Leamington Spa Mineral Waters.

HOSPITAL SUNDAY FUND.—A meeting of the Council of this fund was held on July 29th at the Mansion House, when, on the recommendation of the Committee of Distribution, awards were made to 179 general, special, convalescent, and other hospitals, the total amount available for distribution being £44,410.

BRITISH MEDICAL ASSOCIATION.

SUBSCRIPTIONS FOR 1895.

Subscriptions to the Association for 1895 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches are requested to forward their remittances to the General Secretary, 429, Strand, London. Post-office Orders should be made payable at the General Post Office, London.

British Medical Journal.

SATURDAY, AUGUST 10TH, 1895.

THE ADDRESS IN PHYSIOLOGY.

In selecting the subject of internal secretions for his address Professor Schäfer is to be congratulated, for the study of this deeply interesting problem is not only important to the scientific physiologist, but is of the greatest practical value to the practitioner. Those in busy practice formed the great bulk of the audience, and they have often but little leisure to study the rapid advances of science; they therefore owe a deep debt of gratitude to Professor Schäfer for placing before them in a concise and lucid form the main facts relating to the subject.

The term "internal secretion" is of recent origin, though many of the main facts have long been recognised. Removal of the organs of generation markedly modifies the whole build and temperament of an animal; such an operation causes more than a mere cessation of the generative function. This, of course, has been known for centuries; the effects of the removal of the thyroid have not been known so long, but forty years ago Schiff did the experiment, and noted many of the results; his work was forgotten until it was unearthed subsequently to the important researches of Ord, Koehler, and Horsley. So, too, in the case of the pancreas, the association of pancreatic disease and diabetes was noted by clinicians long before the time of von Mering and Minkowski. Professor Schäfer points out that some glands can be removed without injury to life, such as the salivary and mammary glands. If these organs produce an internal secretion similar to that produced by other glands, the loss after removal must be repaired vicariously.

The address may be subdivided into sections, according to the different glands considered, and evidence is adduced that the liver, the kidney, the pancreas, the thyroid, the pituitary body, and the suprarenals, all produce something which is poured into the venous blood, and is of benefit to the whole body, producing widespread effects on nutrition. In the case of the pancreas, there is also the external secretion, the pancreatic juice, to be considered, and Professor Schäfer makes a new point when he suggests that the newly discovered internal secretion of the pancreas, the removal of which produces diabetes, is connected with the epithelial islands in the organ, which have for so long puzzled histologists.

The thyroid naturally comes in for a large share of notice, for it is in relation to this organ that the best practical results have followed close on the heels of experimental investigation. Professor Schäfer is, however, careful to point out that the successful treatment of myxœdema with thyroid injection or thyroid grafting does not necessarily mean a similar success in the treatment of diseases of other organs by injections of extracts of those organs. He, however, has a small amount of evidence to show that cases of Addison's disease are benefited by the exhibition of extracts of suprarenal capsules taken by the mouth.

The section relating to the pituitary body and suprarenal capsule will be read with especial interest, because most of the facts brought forward are new. In conjunction with Dr. George Oliver, Professor Schäfer has been working at the subject for the last two years, and the result may be read *in extenso* in the current number of the *Journal of Physiology*. With regard to the pituitary body, the theory that this gland takes on a vicarious action when the thyroid is diseased or removed falls to the ground when examined by the experimental method. Extracts of thyroid produce no obvious effects on the heart and cause relaxation of the arterioles, while extracts of the pituitary body produce great augmentation of the heart's force and contraction of the small vessels, leading to a rise of blood pressure.

The suprarenal is treated at greater length; the work of Addison and of Brown-Séquard is alluded to, and then more recent observers, like Abelous and Langlois, who have taken up the subject afresh within the last few years, are considered. These French physiologists confirmed Brown-Séquard's observation that extirpation of the suprarenals is invariably fatal; the blood of such animals is, moreover, poisonous and produces effects which are stated to be similar to curare poisoning.

Schäfer and Oliver confirm the work, in so far as to show that the effects manifest themselves chiefly in the muscular system, but the toxic effects are those of veratrine rather than of curare. The effects of injecting an extract of suprarenal capsules on involuntary muscle is equally marked. The enormous rise of blood pressure which immediately follows the injection is partly due to increase of the heart's force and frequency. This is seen best when the vagi are cut; if these nerves are intact the heart is slowed; the increase of arterial pressure is, however, chiefly due to contraction of the arterioles, and this is a direct action rather than an indirect one through the vasomotor centre, as it is considered by Cybulski.

The nature of the poisonous agent is still uncertain, but the interesting facts have further been made out that it is confined to the medulla of the gland, that it is absent from the suprarenals in cases of Addison's disease, and that the physiological effects are produced by doses compared to which those of homœopaths are gigantic. One-millionth of a gramme per kilogramme of body weight is sufficient to produce physiological effects. The effect is transitory, the poison apparently being packed away and rendered innocuous in certain organs which cannot at present be satisfactorily specified.

Professor Schäfer considers in the case of the suprarenals, as in those of the other organs he discusses, that the theory of internal secretion has more to be said for it than the rival doctrine of autotoxication. To put it more specifically:

one hypothesis is that the suprarenal is excretory; it gets rid of something which accumulates when the gland is removed; this is the theory of autotoxication; the other theory, that of internal secretion, teaches that the organ forms something, in the present case something which is distributed to the muscles, and essential for their normal tone; when the gland is removed, toxic effects are the result of the absence of this internal secretion.

We think that Professor Schäfer has the best of the controversy, but the steps in the argument we must leave to our readers to unravel for themselves; the address will amply repay a full and careful perusal.

OVER-OPERATING IN GYNÆCOLOGY.

SIR WILLIAM PRIMSTLEY'S address, delivered in the Obstetric Section, deserves more than passing notice—it should not be forgotten. The same might be said of any other good address; unfortunately, a speech full of important advice is more often applauded than remembered. The best way to utilise Sir William Priestley's address is to scrutinise closely the work not of charlatans but of enthusiasts. Among the gravest features of the question is the attitude of certain Continental schools. Verneuil, as Sir W. Priestley explained, was violently opposed to many novel radical measures. Unfortunately, several European authorities of high repute continually advocate extreme courses such as total extirpation of the uterus with the appendages in cases of chronic, or even acute, inflammatory affections of the tube and ovary.

Last June the German Gynæcological Association met at Vienna. A leading authority laid down the law that in gonorrhœal disease of the appendages it is absolutely wrong to leave the tube and ovary on one side, even if they seem healthy, and that it is much better to remove the uterus as well. Another authority supported him on the score that many "parenchymatous bleeding areas" are to be found in the uterus in these cases, so he always removes that organ. He does the same, he adds, in cases of malignant ovarian tumour—a clinical and pathological condition quite different from gonorrhœal inflammation. Veit, of Berlin, spoke in a vein of satire. The advocates of amputation of the uterus insist that when the appendages alone are removed, exudations on the two pedicles set up pain, and cause adhesions to the intestine, or else fix the uterus. Veit attributes the exudations to fresh gonorrhœal infection; therefore, says he, "castration of the husband is the best treatment for the patient." Unfortunately in France, as well as in Germany, hysterectomy is extensively carried out. It is difficult to conceive anything more unsurgical than extirpation of the internal female organs for damage done by gonorrhœa; yet foreign authorities seem to go further—they recommend radical operations for pelvic cellulitis after labour. Sir William Priestley makes a note of this great abuse, and rightly adds that the operation is sometimes undertaken because the patient is too impatient to wait for the slow recovery which would have taken place in due course. The truth is, that an operation followed by successful results is not necessarily justifiable, and impatience on the part of the patient is not by any means more absolute justification than her more tardy consent after injudicious advice.

AUTUMN HOLIDAYS IN SCOTLAND.

If the "Great Wizard of the North" had been told that it would be practicable and usual to do a morning's work in London and lunch there, and to sleep the same night in Edinburgh or even Perth, having partaken comfortably of a good dinner served on the road, he would probably have considered the statement as much of a romance as any he had ever invented. Yet Sir Walter Scott has been dead but little more than half a century, and his descendants can now leave Easton at 2 p.m., dine leisurely in the admirable corridor train that departs at that hour, and reach Edinburgh before eleven, and Perth about midnight; while those who prefer night travelling can dine in London and take an early breakfast the next morning in Perthshire. Thus, by the admirable enterprise of the Northern railway companies the Highlands of Scotland are brought, as it were, to our very doors, and we can finish our work in London in the evening of one day, and be shooting on a grouse moor or fishing in a salmon river the next morning in the very heart of Scotland.

Scotland has unsurpassed attractions as a holiday resort for many. It is the paradise of the sportsman. Its grouse moors, its deer forests, its salmon rivers and trout streams, its lochs (many of them yielding admirable sport to the fisherman, salmon, loch trout, sea trout, and in some the beautiful and daintily coloured char,) offer to the sportsman irresistible attractions.

But Scotland has charms also for others. Many distinguished members of our profession who have not been notable sportsmen have found rest and refreshment amidst its wild mountain scenery and in its invigorating, though somewhat rough, climate. The late Sir William Gull spent his autumn vacation for many years at Tulliemet, a fine residence beautifully situated in the highlands of Perthshire. We had the pleasure of finding Sir William there some years ago in his very best "form"—his remarkable conversational powers, his keen sense of humour, his wide and fruitful observation of men and things were far more notable and enjoyable after his mental energies had been recruited by a few weeks' repose in his Highland retreat than they were in the midst of the stress and strain of his London work. The same year we found the late President of the College of Physicians (then Dr. Andrew Clark) occupying that classic abode Abbotsford, a little tormented, we thought, by the constant visits of American and other tourists.

Sir William Priestley, well known as a keen and skilful fisherman, has spent many an autumn vacation on his favourite river, the Spey, and Lady Priestley has written a charming account of the trials attending the creation of a hygienic "Highland home." Sir Richard Quain is proud to exhibit the many trophies of his exploits in Scotch deer forests; and others of the more highly favoured members of our profession who are able to afford the luxury of a "Highland home" think there is no place like Scotland for an "autumn holiday."

But our object now is to offer a few seasonable counsels to those who desire to make acquaintance with some of the more attractive parts of Scotland in the few weeks of an autumn vacation and who are in search of the picturesque and of good bracing air rather than sport. Now there are

certain undoubted drawbacks to touring in Scotland for those who have pleasure and the picturesque only in view. Scotland is in many parts exceptionally wild, picturesque, and beautiful if only its beauties could be seen, but, alas, too often its scenery is out of sight, enveloped in mist and cloud. Louis Stevenson has described the northern summer as a "few flaws of fine weather," and that tourist is indeed fortunate who does not find during many days of his tour some of the finest scenery "veiled in white mists." The damp misty atmosphere, the gloom of the overcast skies, the boggy ground covering the mountain slopes, and the downpouring of chill rains, especially in the Western Highlands, are apt to disappoint those travellers who are accustomed to the clear skies and dry atmosphere of the mountain districts of Italy and Switzerland.

Then the accommodation for travellers is in many parts of Scotland very primitive and rough, and in those places of considerable resort where the accommodation is somewhat better the hotel charges are very high, and the tourist is ordered about by the hotel people much like a schoolboy; he must eat his breakfast and dinner at a particular hour, and he must eat what is given him and not grumble but be thankful, or he will be told to "move on" in order that someone else may have his place. Indeed, it is a common practice in some hotels in favourite resorts in Scotland to refuse to allow guests to remain longer than three or four days at a time, as it is more lucrative to the hotel keepers to have frequent changes. The best accommodation is, moreover, often to be found in those palatial buildings which are noteworthy objects in many a fine landscape in the Highlands, and are well known by the name of "hydros"—although we are assured fluids stronger than water are liberally consumed in them. These, however, are often overcrowded in the height of the season, and visitors who wish to see Scotland in comfort and are at the same time dependent on hotel accommodation should choose the month of June or the latter half of September for their visit, "when guests are few and innkeepers are civil." The weather, too, is often better in Scotland in early summer and in late autumn than it is during the height of the touring season.

Those who enjoy a "sea blow" can hardly do better than take a berth by steamboat from London along the east coast to Leith for Edinburgh, and, if desirous of prolonging the sea trip, it can be continued further north along the east coast of Scotland to Aberdeen, and thence by Cromarty to Inverness. This is a fine sea trip, with interesting coast scenery throughout nearly the whole of the journey. Steamers sail to and from Edinburgh and London three days a week, or oftener; or a Scottish tour may be begun by taking steamer from Liverpool to Glasgow; there is a departure from Liverpool four or five times a week, and this tour may be continued through the Western Isles of Scotland.

Another attractive tour can be begun at Glasgow by taking advantage of the new West Highland Railway which, starting from Helensburgh, passes through some of the finest, most characteristic, and wildest scenery in Scotland; the grand mountain scenery on the banks of Loch Lomond, the wild Highland scenery at Orianlarich, where the railway passes between the high peaks of Ben More and Ben Lul, and then, plunging into the very heart of the Highlands, crosses the hitherto almost inaccessible Moor of Rannoch,

and reaches at Roy Bridge, the Valley of the Spean and Glen Roy, with its singular parallel roads, and continues along the course of the Spean under the frowning mass of Ben Nevis to Fort William, where the tourist, going further north, can take steamer for Inverness, through the Caledonian Canal, or, turning westward, reach Oban by Loch Linnhe, stopping on the way at that beautifully situated spot, Ballachulish, on the shores of Loch Leven, whence he can visit the sombre pass of Glencoe. From Oban numerous attractive excursions can be made, and no finer centre can be chosen for exploring this perhaps the most beautiful and picturesque district in Scotland.

The climate of this side of Scotland is, it must be remembered, remarkably "soft" and damp, and less bracing than the uplands to the North and East, as it is exposed to the mists and fogs of the North Atlantic, but the coast scenery is particularly fine, sea and mountain views being beautifully blended. Oban is well suited for a prolonged stay; it possesses numerous fine hotels and abundant lodging-houses, but all these are apt to be overcrowded during the height of the season, and the wisest course is to time one's visit so as to arrive a little before or a little after this period.

The situation of Oban is itself attractive, and the possession of a fine and commodious harbour enables the visitors there to take a variety of sea-trips such as cannot be found in any other of our coast resorts. It would occupy a column of our space merely to enumerate the steamboat routes, the coaching tours, and the railway trips that can be made daily from Oban. The sea-trips to the remarkable islands of Staffa and Iona should not be missed, the circular tour to Glencoe by steamer and coach is not likely to be omitted, nor the readily accessible charms of Loch Awe. Many tourists prefer to approach Oban by steamer from Glasgow, which enables them to see the fine scenery of the Clyde and the Western Isles to much advantage.

Those who are visiting Scotland for the first time will not be willing to miss seeing Edinburgh, one of the most beautiful cities in the world. From Edinburgh the "Waverley" country can easily be visited in a long day, including Abbotsford House, Dryburgh and Melrose Abbeys, Hawthornden, and Rosslin.

Another very fine excursion is from Edinburgh to Stirling, and thence by Callander through the Trossachs, steaming down Loch Katrine and Loch Lomond, and returning by train to Stirling. Close to Stirling is the celebrated field of Bannockburn; close to it, also, are the Bridge of Allan, a frequented health resort with mineral springs, and Dunblane, where a pleasant stay may be made in the fine "hydro" established there.

An hour or two by train will convey the tourist from Edinburgh or Stirling to the highlands of Perthshire, where he will find himself in the midst of true highland scenery, and enabled to breathe fine bracing highland air. Pitlochry, less than thirty miles from Perth, is an excellent centre for exploring this part of Scotland; it is beautifully situated close to Loch Tummel, the Queen's View, the Falls of Tummel, the Pass of Killierankie, Blair Athole, Dunkeld, Binnam, and many other attractive objects of interest. It has good hotels—Fisher's is well known—and the "Athole Hydro," here situated, is one of the best and most commodious in Scotland. Loch Tay, Loch Rannoch, Loch Erricht, can all be visited from Pitlochry by the aid of the High

land Railway and its branches. In fine weather a carriage drive (or a hardy pedestrian can accomplish it on foot) through wild and grand highland scenery from Pitlochry to the popular mountain resort, Braemar, by the highland pass known as the "Spital of Glenelg" can be commended. Braemar is about fifteen miles from the Spital of Glenelg, and for the pedestrian the distance between Pitlochry and Braemar is only about thirty miles. Braemar is perhaps the highest frequented highland resort for prolonged residence in Scotland, and it is within a few miles of the Queen's highland home at Balmoral, and shares its fine bracing climate. It is stated to be 1,100 feet above the sea level, and it has come to be regarded as the best representative of a high mountain climate to be obtained in Great Britain.

We have not space to dwell on the charms of the surrounding district: they are now familiar to most travellers in Scotland. A fine drive from Braemar to Ballater, passing Balmoral Castle on the road, brings us to the Deeside Railway; thence by rail to Aberdeen, skirting this fine river along a great part of the route, in about two hours. The tourist passing still northwards will take the train at Aberdeen, and passing through Keith, Elgin, Nairn, Inverness, and Beaulieu, will reach Dingwall in five or six hours, from which place Strathpeffer is only four miles distant, and is reached by a branch of the Dingwall and Skye Railway. Strathpeffer is certainly rising in reputation as a health resort, and vigorous claims are being made on the attention of the medical profession in favour of the curative virtues of its sulphur and iron springs, its peat baths, and the invigorating influence of its mountain climate. Here the pedestrian can ascend Ben Wyvis, a not very interesting excursion; but few visitors to Strathpeffer will fail to take that most interesting and picturesque excursion by the Dingwall and Skye Railway to Auchnasheen, and thence by coach and steamer to Kinlochewe, Loch Maree, and Gairloch Head.

Few besides sportsmen are in the habit of exploring the fine scenery of Sutherlandshire. With many sportsmen, however, it is the favourite county; the numerous lochs—such as Loch Shin and Loch Inver—abound in fish, and as much of the county is beyond the reach of railways it escapes the influx of tourists—the bugbear of sportsmen.

Scotland has some fairly attractive seaside resorts on its eastern coast. The most frequented are North Berwick (near Edinburgh), St. Andrews, Stonehaven, and Nairn. North Berwick is one of the most fashionable of Scotch watering places, and its fine golf links are celebrated; it also offers great facilities for sea bathing. St. Andrews is reputed a great resort for men of letters and men of science, and it is the great centre for golf worshippers; it is crowded in the season, and accommodation there has generally to be secured some time beforehand. Stonehaven is quiet and pleasant, and might possibly be found dull by English visitors; it also has golf links. Nairn has many advocates as a bracing, dry, and pleasant seaside resort; it is said to enjoy an exceptionally equable and dry climate, and to be well suited both for summer and winter residence.

But it would be impossible to enumerate in a short article like this the many attractive resources Scotland presents to the autumn tourist. Many take up their abode in one chosen spot, generally in the neighbourhood of loch and river, and spend quietly the few weeks of their autumn

holiday enjoying the calm and simple out-of-door life, even though climatic conditions may not be the most favourable. Loch Awe, Loch Lomond, Loch Tay, Loch Earn (the celebrated "hydro" at Crieff is near at hand), Loch Raunoch, Loch Laggan, Loch Maree, Loch Shin, Loch Inver, and many others are suitable resorts for this purpose.

One word of advice in conclusion. In no place of holiday resort are warm and even heavy waterproof garments so needed as in Scotland—witness the heap of heavy wraps, stout boots, etc., that form an essential part of the Scotch sportsman's outfit when he starts for the Highlands. To our tourist brethren we wish fine weather, to our sporting friends good sport.

In the Section of Pathology, on Friday, Dr. St. Clair Thomson and Hewlett made the somewhat startling announcement that each dweller in London inhales on an average 14,000 microbes per hour. All these organisms remain within the human body, for the air we breathe out is quite free from germs. It is satisfactory to hear, however, that in ordinary conditions of health these armies of intruders are speedily arrested and placed *hors de combat*.

THE WORK OF THE ANNUAL MEETING.

The record of the brilliant meeting which closed last week would be very incomplete without some public acknowledgment of the services of the men whose devoted labours and self-sacrificing zeal contributed so largely to making the gathering one of the most successful in the annals of our Association. Where all worked so well it is almost invidious to select any for exceptional commendation, but it is only bare justice to pay a special tribute of praise to the officers of the various Committees. The success of the meeting was unquestionably in great part due to the manner in which the work was organised by the Executive Committee. The bulk of the work fell upon the Secretaries, Mr. Andrew Clark and Dr. Isambard Owen, and to both these gentlemen, but more particularly to the former, who for six months gave himself heart and soul to the heavy task of organisation, the most cordial thanks of all members of the Association are due. The Secretaries were greatly assisted in their labours by the President (Dr. Leonard Sedgwick), and Mr. George Eastes discharged the duties of Treasurer with the skill and tact born of long experience. Dr. Tirard's well-directed energy as President of the Museum Committee did much to make that department successful even beyond the standard of former years. As Secretary of the Foreign Reception Committee, Mr. Makins earned the personal gratitude and goodwill of all who came in contact with him. Great credit is also due to Dr. Ord as Chairman, and to Dr. Dundas Grant as Secretary, of the Dinner Committee; the arrangements were perfect, and the banquet was admirably managed, especially considering the difficulties caused by the very large number of persons to be accommodated. To Lady Priestley and the other members of the Ladies' Reception Committee the meeting owed the brilliant success of the social functions which relieved the austere side of the proceedings. All who took part in the organisation of the sixty-third annual meeting of the British Medical Association may fairly feel the most lively satisfaction at the result of their labours.

THE CHOLERA.

A TELEGRAM from Cracow, dated August 1st, states that cholera is spreading in South Russia, 409 cases having already been reported. It is reported from Tarnopol (Galicia) that in the towns of Visnovice and Vyzogrod, in Russian Podolia, near the Austrian frontier, Asiatic cholera

has broken out. In the vilayets of Asia Minor the disease had recently much increased. Between May 23rd and July 24th there were 1,194 attacks and 77 deaths officially reported. A case of Asiatic cholera has occurred at the town of Nyireghyha, to the north of Debrecen, in Hungary. The official precautions for checking the epidemic in South Russia have led to a number of encounters between the authorities and the inhabitants. Directly the epidemic assumed serious proportions doctors were sent to the affected spots, and temporary hospitals for the sick were erected, but in several places the inhabitants showed themselves hostile, and force had to be employed to repress antisemitic demonstrations. Ten days' quarantine has been announced at Cyprus on arrivals from the coast between Alexandria and Beyrout, excluding the latter place, and also on arrivals from Cape Khelidonia to Beyrout exclusive.

DINNER AT THE TOYNBEE HALL, WHITECHAPEL.

On the evening of Saturday, August 3rd, Canon Barnett, Warden of Toynbee Hall, entertained at dinner a number of members of the medical profession, including many from Bristol and Manchester, who had been attending the annual meeting. The guests, most of whom were known to take an interest in what Carlyle called the "condition of the people question," especially as exemplified at the East End of London, had an opportunity of seeing the possibilities of usefulness of Toynbee Hall, as a residence for medical students who wish to see how the poor live, and of generally investigating some aspects of its social work. A very pleasant evening was passed.

THE ASSOCIATION AND THE CITY OF LONDON.

Some little criticism has been offered upon the circumstance that, though the British Medical Association held its annual meeting in the metropolis, the presence of so distinguished a body was ignored by the Corporation of the City of London. The following semi-official explanation and apology is offered in the *Daily Telegraph*: It has been pointed out that last year at Bristol, and in 1893 at Newcastle-on-Tyne, the Association received the most generous hospitality at the hands of the local municipal authorities, and that this is quite in accordance with precedent. On the other hand, it is complained that in the City of London, where the Shahzada was but recently entertained, the Association has not been officially recognised. An investigation of the facts seems, however, to entirely dispose of any suggestion of civic discourtesy. It appears that long before the visit of the Shahzada was contemplated, and that visit surely stands apart as possessing international importance, the Lord Mayor received a letter from Sir J. Russell Reynolds, the President of the British Medical Association, with reference to the meetings which are now being held. According to the records of the Court of Common Council that letter was on January 17th last referred to the City Lands Committee, of which Mr. Edward Lee is Chairman, and apparently about the same time a similar communication with regard to the meetings of the Geographical Congress, which had been received from Sir A. Fairbairn, was referred to the same body. At all events on March 14th last the City Lands Committee submitted a report to the Common Council, in which they expressed regret that they could not recommend the Court to give a favourable response to these communications. Their recommendation undoubtedly was based upon the condition of the City finances, coupled with the fact that an application had also been received in respect of a third Congress, and that if one body was entertained the others must be similarly treated. Probably, indeed, the City would have been compelled to spend not much less than £10,000 upon the three Congresses, whereas the cost of the entertainment of the Shahzada,

taking as it did the form of a *déjeuner*, was kept well within £1,500. In the case of the British Medical Association, application was subsequently made for the use of the Guildhall, a request which the Corporation willingly granted on the condition that the Association furnished the necessary expenses; but there was apparently some hitch in this regard, as Sir Russell Reynolds wrote at a later stage, thanking the Corporation for their courtesy, and intimating that the proposed function at the Guildhall had been abandoned. From these facts it is apparent that the British Medical Association was not only dealt with in precisely the same way as two other congressional bodies, but that it was not the fault of the City Corporation that the Guildhall was not placed at its service.

THE OFFERTORY AT ST. PAUL'S.

The offertory collected after the special service in St. Paul's Cathedral on the opening day of the meeting amounted to £42 11s. 6d., being £9 10s. in gold, £32 5s. 9d. in silver, and 15s. 9d. in copper coins. In accordance with the resolution of the Executive Committee, the offertory has been devoted in equal proportions to Epsom College and the British Medical Benevolent Fund.

ANNUAL MUSEUM.

ONE of the best organised departments of the meeting was the Annual Museum, which occupied the whole of the first floor of the Examination Hall, and which focussed all recent advances in pharmacy, foods for invalids and babies, sanitary specialities, surgical and electro-medical instruments, aseptic appliances, books, and the thousand and one items which form the armamentarium of the fully-equipped practitioner of to-day. We elsewhere methodically describe the various exhibits, but we desire here to draw attention to the fact that the museum owed its success chiefly to the labours of the indefatigable Chairman of the Museum Committee, Dr. Nestor Tirard, and to the Secretary, Dr. J. W. J. Oswald, who were assisted by a loyal committee. The excellence of the arrangements was obvious to every member of the Association who visited the museum; whilst the exhibits both gratified and instructed all who devoted any time to their examination. It is not too much to say that the whole community is advantaged by the improvements in drugs, instruments, and appliances of all kinds which such an exhibition renders palpable to practitioners from all parts of the country.

VISIT TO THE POPLARS, SUDBURY.

By special invitation of the British Institute of Preventive Medicine a large party of members of the Association visited the Institute's farm at Sudbury on Thursday, August 1st. The guests were received by Dr. and Mrs. A. Ruffer, and, after Sir Henry Roscoe had expressed the gratification felt by the Institute at receiving so many well-known sanitarians, Dr. Ruffer gave a careful explanation of the methods used for preparation of "curative serums" for diphtheria, tetanus, puerperal fever, etc. At the close of the lecture the guests inspected the laboratories and stables, and, having partaken of refreshment, returned to town after a most enjoyable visit. It was only too manifest that Dr. Ruffer had not as yet recovered from his recent attack of diphtheria, but it is to be hoped that he will return to duty after his much-needed holiday fully restored to health. One point in connection with the above visit which appears to be specially worthy of note is the indifference of the horses. The visitors were much struck with the total absence of any manifestation of fear displayed. If the operations they are subjected to were painful, it might be reasonably expected that the animals would shrink from the hand of any person. As a matter of fact, they appear to be perfectly happy and in excellent condition. One

animal was injected with toxic serum whilst the party were present, but no sign of fear was displayed. The evidence of indifference on the part of the horses is a complete answer to the virulent attacks made on this work by certain societies which cannot be called humanitarian, as the welfare of man appears to be the last item of their programme.

OLD WORKS ON ANATOMY.

In the Section of Anatomy Dr. Payne read a paper on an Unpublished English Anatomical Treatise of the Fourteenth Century and its Relation to the Work of Thomas Vicary. The manuscript contained an incomplete treatise of surgery and a short treatise on the anatomy of the human body. The work was said to be by an English surgeon whose name is not given in the work, which was dated 1392. Dr. Payne said that from the writing, the substance, and the language of the work it had been written during the latter part of the fourteenth century. Professor Anderson and Dr. Payne also exhibited a collection of old anatomical treatises, among which were examples of Bidloo, Browne, Cowper, Coiter, Cheselden, Camper, Duval, Duverney, Eustachius, Highmore, Godifredi, Mondini, Rummelin, Spigolini, Vesalius, and Vicat.

POLICE SURGEONS' ASSOCIATION.

The annual meeting of this Association was held at King's College on July 30th, when Sir H. D. Littlejohn, of Edinburgh, took the chair as President for the ensuing year. The report from the Council dealt principally with the deputation to the Home Secretary in the early part of this year, and its results. Three out of the four points asked for having been granted, it was resolved to approach the new Government on the subject of the payment of adequate fees to medical witnesses, and to ask that another deputation be received. The following officers and Council were elected:—*President*: Sir H. D. Littlejohn, M.D. *Vice-Presidents*: T. Holmes, F.R.C.S., and T. Bond, F.R.C.S. *Treasurer*: H. Nelson Hardy, F.R.C.S. Edin. *Honorary Secretaries*: F. W. Lowndes, M.R.C.S. (Liverpool), H. C. Hopkins, M.R.C.S. (Bath). *Council*: J. R. Baumgarten, M.R.C.S. (Newcastle), J. Paul Bush, M.R.C.S. (Bristol), G. Harrison, M.R.C.S. (Chester), W. J. Heslop, F.R.C.S. Edin. (Manchester), E. K. Houchin, L.R.C.P. (London), H. W. Roberts, M.R.C.S. (London), W. G. Lowe, M.D. (Burton-on-Trent), D. McDonnell, M.D. (Belfast), L. Maybury, M.D. (Portsmouth), W. M. Roccoft, L.R.C.P. (Wigan), C. Templeman, M.D. (Dundee), and S. Wolferston, L.R.C.P. (Plymouth). A vote of thanks to the Right Hon. H. H. Asquith, M.P., for his courteous reception of the deputation from the Council, and for carrying out some of their principal recommendations before leaving office, was unanimously agreed to, and has since been greatly acknowledged by the right honourable gentleman.

THE CONTINENTAL ANGLICAN AMERICAN MEDICAL SOCIETY.

ADVANTAGE was taken of the presence in London at the British Medical Association's meeting of a large number of members to hold the annual meeting this year for the first time in the metropolis. A goodly sprinkling of members assembled on Friday, August 2nd, at the Savoy Hotel, under the presidency of Sir Richard Quain, M.D., F.R.S., one of the Society's Honorary Presidents. After the usual routine business had been transacted, five new members were elected, the places where they practise (Paris, Boulogne, Monte Carlo, Gibraltar, and Tangier) sufficiently illustrating the wide scope of the Society's usefulness. Dr. Barnard (Paris), the Honorary Secretary and Treasurer, stated that the total number of members of the Society now reached ninety-six, and that the cry was "still they come." In view of the difficulty of arranging a well-attended gathering in Paris, it was decided on the proposition of Dr. Barnard

to hold next year's meeting at the same time and place as the British Medical Association. The meeting was followed by a luncheon at the same hotel, when fifty-four sat down, Sir Richard Quain again presided, supported by Mr. Ernest Hart, Dr. Theodore Williams, Dr. Symes Thompson, Mr. Malcolm Morris, the Hon. Alan Herbert, M.D. (Paris), Dr. Sturge (Nice), Dr. Faure Miller (Paris), the Hon. Gerard Walpole, and a great number of other leading Anglo-Continental physicians. After the toast "The Queen and the President of the United States" had been drunk, Sir Richard Quain proposed "Prosperity to the Society," expatiating in eloquent terms on the need supplied by such a body. Responding to the toast of "Our Guests," Mr. Ernest Hart expressed his pleasure at having an opportunity of meeting such a representative gathering of Continental, British, and American practitioners, whom it was most important that physicians and surgeons in the Old Country should know personally. The Society was one which had a very useful future before it, and he wished it a career of ever-growing usefulness and prosperity. Dr. Barnard (392, Rue St. Honoré, Paris) will gladly supply any information on the Society's working, together with the revised list of members, which will be ready in a few weeks.

THE EDINBURGH EXTRA ACADEMICAL SCHOOL OF MEDICINE.

For some time back it has been felt that to give cohesion and solidarity to the Edinburgh Extramural School of Medicine there ought to be a Central Board, or Court, or Committee. Time was when the school was under the *agis* of the Royal Colleges of Physicians and Surgeons, but this arrangement had long ago fallen into abeyance, and the school now consists of a large number of independent teachers, each pursuing his own independent course. Thus organisation, representation, and discipline are lacking, and to the detriment of the School. While no definite scheme has yet received the *imprimatur* of the lecturers and schools and colleges concerned, the probability is that a Board, consisting of an equal representation of the Royal College of Physicians, the Royal College of Surgeons, and the lecturers themselves, will be formed. The matter is to come formally before the Colleges on an early day.

MEDITERRANEAN FEVER IN THE LEVANT SQUADRON.

WE understand there has been an increase in the number of cases of Mediterranean fever in the squadron cruising in the Levant, due in a great measure to the exceedingly hot weather which has recently prevailed in that locality. Apart from this increase in the number of cases of fever, which is not unusual at this season of the year, the general health of the officers and crews would appear to be very good.

SMALL-POX IN WORKHOUSES: OFFICIAL CIRCULAR.

THE Local Government Board have issued to all clerks to Boards of Guardians a circular letter, dated July 30th, relative to the steps requisite to check the spread of small-pox in casual wards and workhouses, the letter resulting from the occurrence therein of cases of the disease in different parts of the country. The letter reproduces the salient paragraphs of the Board's circular on the same subject of February 13th, 1893, and emphasises the need for early notification to the medical officer by the master of the workhouse or the superintendent of the casual wards of every case of small-pox or suspicious illaens in paupers, as well as for great care in the discharge of those likely to be suffering from the disease or recently convalescent therefrom; also the desirability of prompt isolation of patients ill of small-pox away from the workhouse, preferably by concerted action with some adjacent sanitary authority possessing suitable hospital accommodation, the workhouse only being

used in emergent cases. All requisite vaccination and re-vaccination of inmates, nurses, etc., are pressed as important factors; and the Board desires to be kept informed of the occurrence of all dangerous infectious diseases in workhouses and casual wards, and of the measures of prevention adopted in reference thereto.

A WAR SCARE.

An official letter from the War Office was read at the last meeting of Boards of Guardians at the East End inquiring what number of beds would be available in case of war or the invasion of London for the public service. As all the East End workhouses are full, it was not easy to give a definite answer to this unexpected question, and the War Office will probably be referred to the Local Government Board for information on the subject, which can in any case only be conjectural. Much surprise and some disquietude were expressed at the receipt of this communication, which was somewhat rashly and no doubt incorrectly connected with disquieting rumours concerning the unfriendly attitude on various pending questions of a neighbouring European Power.

THE THROAT HOSPITAL, GOLDEN SQUARE.

THE letter published last week in the *BRITISH MEDICAL JOURNAL* and other newspapers signed by the Duke of Sutherland, Mr. R. Courtenay Welch, and Dr. Greville Macdonald intimating their entire severance of all connection with the Throat Hospital, Golden Square, has drawn attention afresh to the affairs of that institution. After looking into the matter with some care it seems clear that, whatever the final cause of difference, personal matters are so far involved as to render it difficult to discuss the situation without entering upon questions regarding which there is no public advantage in expressing any opinion. The chief point of interest, we consider, so far as the profession or public is concerned lies in the illustration once more thus afforded of the facility with which, in the case of small special hospitals, a few individuals can, by concerted action, obtain large influence in the management. So long as special hospitals are conducted in the uncontrolled and unrestricted manner which now prevails, and so long as private interests, partialities, and prepossessions are permitted to hold sway, squabbles of this kind are likely to be of frequent recurrence. Sometimes they reach the character of public scandals, as in two recent notable instances—the Jubilee Hospital and the Chelsea Hospital for Women. In this case they do not show anything else than wrangling of a painful order. Something like a central control, such as Lord Sandhurst's Committee, might help to prevent these frequent disorders in the management of "special hospitals." These disorders, we may add, are by no means confined to London, but are inherent in the character of these minor institutions, most of which, while having a certain character of public usefulness, are devised, founded, and carried on with a "special" eye to private interests.

SALE OF POISONS.

THE necessity of statutory regulations of the sale of poisons was manifested in a striking manner by the facts brought out in evidence at the Mansion House, when Messrs. Spiers and Pond were charged with having infringed the Pharmacy Act by selling an article described as "weed killer," and containing sufficient arsenic to kill six thousand persons. The prosecution was instituted by the Pharmaceutical Society, whose duty it is under the Act to take proceedings in such cases, and the nature of the article sold was proved by Dr. Stevenson and Mr. Eastes. The case was so clear that the possibility of defending it was scarcely conceivable, though in point of fact it was attempted to contend that the article was not a poison within the meaning of the Pharmacy Act. In face of the evidence given as to the amount of

arsenic present in the "weed killer," and Dr. Stevenson's opinion that it was to be regarded as a preparation of arsenic, the contention of the counsel for the defence was too much for the Lord Mayor to accept, and he decided that the Act had been infringed, inflicting a penalty of £5, with costs. That no other result was anticipated may be gathered from the circumstance that the directors of Spiers and Pond had, previously to the hearing of the case, decided to discontinue the sale of the "weed killer." But it is none the less evident, as the Lord Mayor remarked, that it is the duty of the vendors of such proprietary articles to make inquiry as to their nature before supplying them in the ordinary course of business, and it must be added that it is equally the duty of the manufacturers of such poisonous articles to provide against their unlawful sale by labelling them in accordance with the requirements of the Pharmacy Act.

THE KENT COMBINED SANITARY DISTRICTS.

THE Malling Urban District has withdrawn from the West Kent combination, and at a conference of the remaining authorities it was decided that a medical officer of health should be appointed at a salary of £700, out of which he is to pay a clerk £100. In other words, the new officer will receive £600 for his services. The salary paid to his predecessor was £800. A secession is reported in East Kent, too. Whitstable having become an urban district and decided to appoint a medical officer of health of its own. It had formerly been part of the Blean Rural District, in the East Kent combination, of which Dr. M. K. Robinson is the medical officer of health. These defections are not calculated to promote confidence in the stability of voluntary combinations.

SUCCESSFUL LIGATURE OF THE INNOMINATE ARTERY.

MR. COPPINGER's patient, whose innominate and carotid arteries were simultaneously ligatured in 1893, and whose progress towards recovery was noted in the *BRITISH MEDICAL JOURNAL* during many weeks, is now about being presented for inspection in London. The operation was performed at the Mater Misericordie Hospital in January, 1893. The patient was shown six weeks later at a meeting of the Royal Academy of Medicine in Dublin as a case of successful ligature of the innominate artery, and was exhibited six months afterwards at the meeting of the British Medical Association at Newcastle-on-Tyne, as an instance of cure of subclavian aneurysm by simultaneous ligature of the innominate and common carotid arteries. The patient, a man, aged 55, is now in good health—two years and a-half after operation—and is the only living example as yet exhibited in Europe of cure of subclavian aneurysm by innominate ligature.

IS BANK HOLIDAY A FAILURE?

Do bank holidays really conduce to the greatest happiness of the greatest number? In theory, the feasts of St. Lubbock are a blessing to the people and a joy to the philanthropist—little oases in the desert of workaday existence, where the burden can be laid down for a moment, and a draught of fresh strength and hope drawn from the living spring of rest. But what are they in fact? Days of feverish rushing about; of scrambling for places in overcrowded trains and omnibuses; of hustling and being hustled; of noise, horseplay, and fighting; too often of drink and dissipation. Bank holiday is a paradise for roughs, but to decent folks, and especially to women, it must often be a veritable purgatory, without the redeeming feature of purification. If there be anything more pitiable than the sight of a weary woman plodding along with a child in her arms and half a dozen others clinging to her skirts it is the spectacle of these helpless innocents themselves being dragged ruthlessly about to make a parent's

holiday. We are said to take our pleasures sadly, but if this kind of thing be pleasure, it may well be asked, What is pain? It is argued by some that these people like crowds and find a pleasure in going about together in flocks like sheep. This may be true, but it only proves that they are not always wise in their likings. To say nothing of risks from bad weather—and Jupiter Pluvius seems to feel a malicious pleasure in drenching holiday makers—bank holiday is in itself a source of not a few dangers to health. The mere fatigue of travelling must be considerable, especially in the case of children, and there is pretty sure to be excess in eating and drinking, to say nothing of various forms of unwholesome excitement. It is safe to assume that a large number of illnesses date their origin from a bank holiday. It would be going outside our province to speak of the dislocation of business and the unsettling of habits of work—in many cases for several days after the feast—which it entails. The remedy lies in a more rational arrangement of holidays. Why should we all take them at the same time? Everything that Mr. Traill has lately been saying as to the absurdity of well-to-do people all going abroad or to the seaside together applies with tenfold force to bank holidays. By all means let there be even more holidays than there are now, but let each section of the population, or, better still, each individual, make separate arrangements. There would surely be no difficulty in making the monthly "day out" demanded by servant girls a compulsory clause in every agreement between employer and employed. Some, at least, of these days should be given to complete rest, either at home or in some place "far from the madding crowd;" occasionally a holiday might with advantage be spent in bed. On the whole, we think that bank holiday, if it is intended as a period of rest, is a failure. If, on the other hand, it is meant to be a kind of national Saturnalia, the sooner it is done away with the better.

THE ARUCCIO:

AN APPARATUS TO PREVENT THE OVERLYING OF INFANTS.

EVERY year, especially on the nights following some general holiday in the colder parts of the year, a large number of infants meet with their deaths in their mothers' beds, being "overlaid," or more probably suffocated under the bedclothes, during the sleep, sometimes, perhaps, the drunken sleep, of their mothers. Numerous cases of this kind were reported during the cold season in January and February last, and even more recently, and in many instances coroners' inquests have been held, but we are not aware that any practical means of checking this annual tribute of life has been suggested. The proposal to seek special legislation forbidding mothers to sleep in the same bed with their infants under special penalties in the event of injury has been made, but it is to be doubted whether such a proposal would meet with much support in Parliament, or indeed from public opinion.

Under these circumstances it may be interesting to call attention to an apparatus of a simple kind which is used in Italy, or in certain parts of it, designed to prevent the suffocation of infants in bed with their mothers or nurses. The apparatus is described briefly in the late Dr. Charles Clay's *Cyclopædia of Obstetrics*, which came to a premature close after reaching to "Auscultation" (Manchester, 1849). From the short article in this *Cyclopædia* we borrow the accompanying engraving. The appliance is there described under the name "Aruccio" and is said to have been "formerly used in Florence." It appears, however, that it is still well known in Florence under the name "Arcuccio." At our request Dr. Stuart Tidey kindly made some inquiries for us in Florence. He applied in the first place to an old servant in his employment, who is, he states, well acquainted with the popular customs and traditions of Tuscany. In answer to his question the old woman said that it was the general rule for the infant to sleep in the same bed with the mother or nurse. When asked whether infants were not

sometimes suffocated, she replied at once, "No, Signor, but then the arcuccio is always used. It is a wooden framework, with arches of iron to prevent the child being overlaid. It is placed in the bed between the husband and wife. In my country (Pistia) we call them 'arocchi.' In answer to the question whether they were in common use in Florence, she

replied in the affirmative, and offered to borrow one for inspection from a neighbour who had brought up a large family. Within five minutes the arcuccio arrived. It had evidently seen much hard use, but was still serviceable. It consisted of a wooden head piece, measuring 10 inches by 13 inches, two wooden sides 22 inches long and an inch or so thick, a top bar of wood of the same length, and a curved iron bar as a footpiece. The width was the same at the head and foot, but the headpiece was 3 inches higher than the footpiece. This arcuccio was said to be larger than usual, and a second arcuccio, borrowed from another neighbour, and designed for the protection of a newly-born infant, was 22 inches long, 8½ inches wide, 9 inches high at the head, and 8 inches high at the foot. The dimensions given by Dr. Charles Clay in the work cited above were 3 feet 2½ inches long, and 1 foot 1 inch broad. The framework of the arcuccio is frequently bound with flannel.

The arcuccio is also used as a protection to the infant by day. If the peasant mother go out to work she will leave her child in the bed protected by the arcuccio, over which the bedclothes are drawn, but so as to leave a space for air near the head. It would appear therefore that the arcuccio, in addition to preventing suffocation in bed, has the further virtue of diminishing the risk of falling out of bed which is a frequent accident in the homes of the poorer classes in this country, and the cause of much distress and impaired health, and sometimes of serious injury.

In the *Cyclopædia* it is stated on the authority of *The Art of Nursing* (London, 1735), "in respect of the aruccio, that every nurse in Florence is obliged to lay the child in it, under pain of excommunication."

As to this Dr. Tidey's informant stated that the country priests do exhort mothers not to leave their infants unprotected by the arcuccio; should a death occur through such neglect, the mother would incur ecclesiastical censure. There appears to be no special law upon the subject in any part of Italy, but the use of the arcuccio is enforced partly by public opinion, which would judge very severely any mother whose child lost its life owing to failure to use a well recognised precaution, and partly by the injunctions and threats of the Church.

On the whole it would seem that the use of the arcuccio is very general in Tuscany at the present day. It is used Dr. Tidey thinks "invariably when the child is left in bed in the day time, and generally at night to prevent its being overlaid." We are indebted to Professor Boncinelli, who personally investigates the causes of deaths in Florence, for the information that deaths of infants from suffocation are extremely rare. He has only met one such case in the course of the seven years he has been entrusted with the duty of making medico-legal inquiries in Florence.

Dr. Luigi Concetti, Professor of the Diseases of Children in the University of Rome, in a private letter, confirms fully the accuracy of the information obtained for us by Dr. Tidey. He states that the arcuccio is in general use in Tuscany, to prevent the suffocation of infants either by the bedclothes or by their mothers. It is placed, he says, in the middle of the bed, with the child within it. He adds that there is no special law with regard to the use of this appliance, but in the case of the suffocation of an infant in bed action would be taken for homicide by negligence. He says, also, that the statement that the Church would excommunicate the mother in the event of the death of the infant is incorrect.

¹ Diminutive from *Arco*, a bow, an arch.

BRITISH MEDICAL ASSOCIATION. SIXTY-THIRD ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION IN LONDON, 1893.

EXCURSIONS.

Windsor.—About 200 members, nearly all of them provincial, availed themselves of the excursion to Windsor and Hampton Court. Leaving Waterloo at 8.55 by special train, the party reached Windsor before 10, and spent about two hours in visiting the State apartments of the Castle, the Memorial Chapel, and St. George's Chapel. Proceeding to the river, three steam launches were found ready to convey the excursionists to Hampton Court, and a start was made punctually at 12 o'clock. The journey down the river occupied about 4½ hours, and the pleasure was somewhat marred by two or three heavy showers of rain, but thanks to the commodiousness of the boats all were able to get under cover. On arrival at Tater's Island tea was provided, and a start was about to be made to Hampton Court Palace soon after 5, but a very heavy shower detained the party upwards of half an hour, so that there was no time to visit more than the gardens. These, however, and the large vine, which was specially kept on view, were considered well worth the visit, and the party assembled at Hampton Court Station at 7 o'clock, quite satisfied with their day's outing. Waterloo terminus was reached at 7.40.

Oxford.—The party reached Oxford about 11 o'clock, and were met at the station by Dr. Dixey and Dr. Merry, who conducted them by way of the High Street and Radcliffe Square to the Sheldonian Theatre. Here they were received by Mr. H. P. Symonds, the President of the Oxford Branch of the Association, who welcomed the visitors in a short address. After inspecting the Bodleian Library and the Old Schools Quadrangle the party proceeded to Wadham College, where Dr. Dixey referred briefly to the scientific and medical traditions of that foundation, which was the cradle of the Royal Society, under Wilkins, and the scene of early chemical and physiological experiments by Christopher Wren, John Mayow, and Robert Boyle. Passing through the beautiful gardens of Wadham College the company next arrived at the University Museum, where Professor Burdon Sanderson gave an address, explaining its history, structure, and uses. Further remarks were added by Dr. T. Acland. The different departments of the museum—*anatomical, physiological, zoological, chemical, and physical*—were then visited, under the guidance of Professor A. Thomson, Drs. Pembrey, Turrill, Benham, Hobhouse, Freeborn, and others. The Radcliffe Library was also seen and each visitor received a paper containing a short account of the library, with regulations, etc., by the kindness of the Radcliffe Librarian, Sir Henry Acland. Luncheon was served in the Hall of Christ Church. At the conclusion Dr. Merry, the Public Orator of the University, proposed the health of the guests, to which response was made by Dr. Moore (Dublin) and Professor Tillmanns (Leipzig). Speeches were also made by Dr. Stoker, Mr. Symonds, and Viscount St. Cyrus, representing the authorities of Christ Church. After lunch the company, led by Dr. Collier, Mr. Wimsell, Mr. D'Arcy Power, and others, visited various places of interest, including Magdalen College, shown by the President of Magdalen; Merton (the College presided over by Harvey, shown by the Rev. A. Johnson; and New College, shown by Mr. Bourne. After tea in the hall of Exeter College, the visitors returned to the Great Western Station, whence a special train at 6 o'clock took them back to town.

Eastbourne.—A party of 150 were conveyed to Eastbourne by special train, where they became the guests of the Eastbourne Branch of the British Medical Association, and were entertained at a sumptuous lunch at the Town Hall, Dr. Ewart, the President, being in the chair. The Sussex Militia Band played during lunch. Dr. Ewart, in a brief speech, welcomed his guests, which was responded to by Mr. Robert O'Callaghan and the Mayor of Eastbourne (Mr. Skinner), the latter giving a cordial invitation to the British Medical Association to meet at Eastbourne next year. Mr. O'Callaghan thanked the

President, in the name of the Metropolitan Counties Branch, for their hospitality and courtesy in helping them to entertain the members who had visited the London meeting. After luncheon half a dozen four-in hands were ready to convey the party, under the guidance of Dr. Ewart, to Beachy Head, the Lighthouse, Birling Gap, over the Downs to Wannock Glen, and back to Eastbourne. At Wannock Glen tea was served, with delicious peaches, fresh fruit, and cream galore. Every member enjoyed himself immensely, notwithstanding the damping effect of several showers, and returned to London greatly pleased with the hospitality so lavishly extended to them by Dr. Ewart and the members of the Eastbourne Branch.

Hastings.—Those who chose this trip left Victoria at 10 A.M. in the same special train which conveyed the party to Eastbourne. On arriving at Hastings they were met and given a hearty welcome by many of their resident *confrères*, who conducted them to the Concert Hall, where a sumptuous repast was provided. Dr. Bagshawe presided, and was supported by the Mayor (with his chain of office), Sir Alfred Garrod, Canon Jones, Major-General Sherer, and a large number of the medical profession of the town. After lunch and the usual loyal toasts Dr. Bagshawe proposed the health of "The Visitors," for whom Sir Alfred Garrod and Dr. Drysdale returned thanks. Mr. Brodribb proposed "The Mayor and Corporation," to which the Mayor replied. Dr. J. W. Hunt, who conducted the party, proposed "Our Hosts and the Chairman," and Dr. Bagshawe replied. Arrangements had been made for an excursion to Battle in the afternoon, but the unpunctuality of the train prevented this. Instead the visitors were conducted in carriages to various places of interest in the town, including the Castle and the Hospital. At 5 P.M. Mrs. Bagshawe received at "afternoon tea" all the visitors, and a most enjoyable hour was spent, which was enlivened by the performance of an excellent string band. The visitors left delighted with the courtesies which had been showered upon them by their host and hostess and the profession of the town. The arrangements were all that could be desired, and reflected the greatest possible credit on Dr. Christopherson, the Secretary of the Entertainment Committee.

Maidenhead, Marlow, and Greenlands.—This was the most popular excursion provided for members and their ladies, if one may judge by the great rapidity with which all the tickets were disposed of. Unfortunately its success was marred by many showers of rain, but with this exception everything went well, and the ninety-four guests who took part in the excursion expressed frequent satisfaction at the entertainment provided. Notwithstanding the fact that the day was one of the busiest in the whole year on the railways, the journey on the Great Western line was accomplished with punctuality, and on arrival at Maidenhead the party left the railway, and was thence conveyed by road through the pleasant uplands of Maidenhead Thicket to Cookham Dean, where Mr. and Mrs. Noble Smith entertained the members at their country house. Mr. Eastes and Mr. Parker Young escorted the party, and the former expressed the thanks of all present to the host and hostess for their generous hospitality. The carriages were again requisitioned, and conveyed the party through the lovely Quarry Woods to Marlow. Hence a large steam launch carried the visitors up the Thames, through some of the best of its many lovely scenes, to "Greenlands," the seat of the Hon. W. F. D. Smith, who had provided luncheon in a large marquee at the side of his house. Mr. Parker Young proposed as a toast "The Health of Mr. Smith," and Dr. Ward Cousins (President of Council of the Association), who was of the party, added his appreciation of the hospitable entertainment provided. Unfortunately Mr. Smith, being away in Devonshire, was unable personally to meet his guests or reply to the toast. The members enjoyed a walk through the gardens and greenhouses; and, embarking again on the launch, were conveyed back to Marlow, and partook of tea at the Compliant Angler Hotel. Dr. Ward Cousins, in the name of the visitors, thanked Messrs. Eastes and Young for their efforts to render the day enjoyable. A train, somewhat delayed by the heavy traffic on the line, at length landed the visitors in safety at Paddington, and thus brought to a close this memorable and successful week of the 63rd annual meeting of the Association.

Reading.—A party of ladies and members, numbering over 100, under the guidance of Mr. Jessop, proceeded to Reading from Paddington on Saturday. They were met at Reading Station by several members of the Reading Branch, including Dr. Guilding (President) and Dr. Phillips-Conn (Secretary), and were escorted to the Town Hall. After inspecting the reproductions of the Bayeux tapestry, they were entertained at a most excellent luncheon by the Branch at the Town Hall. The company included the most prominent members of the Branch, the Mayor of Reading, and several ladies. After the loyal toasts and the health of the Mayor had been drunk, Dr. T. O. Maurice proposed "The Guests," which was responded to by Mr. Jessop. Sir Charles Cameron proposed "The Branch," coupling with it the name of the chairman, Dr. Guilding. The party then embarked at Caversham Lock on two steam launches, and went up stream to Goring. On the return journey tea was provided at Caversham Bridge Hotel, and thus was brought to a close a very enjoyable day, notwithstanding the inclement state of the weather. Everything had been most carefully arranged and provided by the Branch and Dr. Symons Eccles.

Haslemere.—The weather was not propitious on the occasion of the visit to Haslemere, on the invitation of Mr. Hutchinson: the sun hardly showed his face, and occasional furious rainstorms drifted down the valleys and drove across the moorland of Hindhead; nevertheless the air was sweet and pure, the view, a study in grey and purple, was superb, and the attentions of a genial host and charming hostesses invested with pleasant memories much that climatic influences tried to spoil. In fact, the humanising influence of muddy boots was well displayed, for with such appendages formality was impossible. On the arrival of his guests at Haslemere, Mr. Hutchinson invited them to the new museum, where a most welcome lunch was prepared for their entertainment. When this had been partaken of, he explained the leading features of the museum to which the building is to give a home—a museum in which everything is to be educational, and into which "curiosities," as such, are not to be admitted. On the side will stand geology, the space being divided according to the estimated duration of the different epochs in geological time; within the building will be biology, specimens of plants and animals being arranged to show their various orders and relationships, the specimens being such as can be handled by the students, and the pictures being movable, so that they can be carried about for comparison with the various specimens; and then, in a separate room, will come the museum of man, displayed historically, the wall space being ruled off into centuries, the events of each of which, growing more crowded as time goes on, fall into their proper place, a plan by which it is hoped that a general view of history will be obtained which will supplement and knit together the local histories taught in books. After inspecting the museum the visitors set out for Hindhead, the beauties of which point of view are well known, and on their return were entertained again by Mr. Hutchinson, at his house at Inval, where "high tea" was provided. After Mr. T. Holmes had in suitable terms thanked Mr. Hutchinson for his hospitality, the party drove to the station well pleased with their excursions, notwithstanding what Mr. Holmes had euphemistically spoken of as the "dampness" of the afternoon.

Andover.—On Friday Dr. Poore personally conducted a large party to view the arrangements for the disposal of excreta and slops at his house at Andover, described in his work on *Rural Hygiene* and elsewhere. He had given strict orders against any preparation for the visit, except that gutters, etc., were not to be cleaned for several weeks previously; and the success of the system from the sanitary and economic standpoints alike, the utter absence of anything to offend the sight or smell, the purity of the streams and ground water, and the luxuriance of the crops of every kind could not but impress the most incredulous. The essential features are the burial of the faecal matters collected from the earthclosets or dry catches while still fresh, and within a few inches of the surface, in different parts of the garden as each is cleared of crops, or in trenches between the rows of currant, etc., bushes, and around the roots of fruit trees. In two to four weeks, or six in wet weather, all visible traces of excrement have disappeared, but of green crops the cabbage tribe alone

tolerate the raw manure; other vegetables, from roots to peas, following one another in rotation for about three years before the turn of the plot—with the available quantity of manure, the excreta of 100 persons to the acre for manuring comes again. Household slops, together with the rain water, are conveyed by open tile gutters to a larger open rectangular channel, with a floor of perforated tiles or overlapping slates to serve as a coarse strainer, beneath which a bed of loose stones, and forms a sort of elongated sump. The foul water from the scullery sink undergoes a preliminary filtering before joining the other slops, the filter being built up against the wall, cement lined, filled with broken limestone, and covered with perforated zinc. It is in two compartments, the waste having a reversible nozzle, so that when one has been long in use it can be emptied, and the material exposed to the purifying action of the air. The subsoil is here a sandy loam overlying the chalk, and the ground water rises to within 3 or 4 feet of the surface; yet that in a well in the centre of the garden, though rich in nitrates, contains no ammonia and not more than twenty bacteria to the cubic centimetre; and a stream crossing the garden, which was formerly a fætid ditch, is now a rapid pellucid brook.

Epping Forest and Claybury.—The Epping Forest and Claybury excursion was in charge of Dr. Kitchin (Crocker, Dr. Baxter Forman, and Mr. Kraine. The party went by special train to Woodford, where they were met by coaches which conveyed them to the Claybury Lunatic Asylum. At this model institution they were met by Dr. Jones, the superintendent, and the other officers of the asylum, by whom they were shown all over the building, and were able to see not only the latest appliances in the administration of so large a community, as the asylum accommodates some 250 lunatics, but also that the poorest lunatic has every possible care and comfort, and many advantages over the best managed private asylums. After lunch, which was furnished by the steward of the asylum at the expense of the metropolitan members of the Association, the party re-entered the coaches and drove through some of the most beautiful portions of the Forest to the charmingly situated hotel and Chingford, where tea awaited them, and after being photographed in commemoration of their trip, they returned to town, having had a pleasant excursion, marred only by a heavy thunderstorm just after leaving Claybury.

ENTERTAINMENTS.

The Conversazione at the Royal College of Physicians.—For the conversazione on Friday, August 2nd, at the Royal College of Physicians, the officers of the College had made great preparations, and the building was tastefully decorated with flowers, etc. Refreshments were provided in the Small Library, and the band of the Royal Artillery played in the hall, but the attendance of visitors was not commensurate with the preparations made for their reception, partly owing, perhaps, to the counter-attraction at the sister College, and partly to the exclusion of ladies on account of the limited space at the disposal of the entertainers.

The Conversazione at the Royal College of Surgeons.—On Friday, August 2nd, the Royal College of Surgeons hospitably entertained the members of the British Medical Association. The guests were received by the President, Mr. Christopher Beath, and the Vice-Presidents, Mr. Reginald Harrison and Mr. T. Pickering Pick, in the New Large Museum, and then passed onwards through the extensive suite of rooms in which, besides the ordinary contents of the Museum, many objects of interest were displayed for their inspection. In the Western Museum the String Band of the Royal Engineers gave an admirable performance, the London Welsh Glee Singers were in the Theatre, and the Edison Kinetoscope was on view in the New Small Museum. Various objects of interest were displayed in the Council Room, and the Hunterian relics in the Library Committee Rooms attracted considerable attention. The conversazione was very largely attended, and the scene was brilliant; the music, the bright dresses, and the constant movement making it difficult for habitués of the place to believe that they were indeed in the same rooms to the sober and serious aspect of which they were so well accustomed. Refreshments were liberally provided, and the large library in which they were served became

a place of reunion in which many people met who, in the more scattered work of the Sections, had not had many opportunities of coming across each other. All the arrangements were most admirably planned and carried out, and everyone felt that this hospitable reception by the Royal College formed a fitting finale to the many festivities which had marked the London meeting of 1895.

Ladies' Evening Party.—This was arranged by Lady Priestley and the members of the Ladies' Reception Committee, and took place at the New Gallery, Regent Street, on Thursday evening, August 1st. The summer exhibition of pictures by many well-known artists was on view, and the Blue Zouave Ladies' Orchestra performed a fine selection of music during the evening. The extensive rooms of the Gallery were all illuminated and opened to the visitors, and a brilliant company assembled in response to the invitation. Lady Priestley and other ladies received the visitors, about a thousand in number, who were much gratified with the well-considered arrangements made for their entertainment. Altogether this was certainly one of the most pleasing functions of a week in which, from the multiplicity of such receptions, it was difficult to excel.

Reception at the Temperance Hospital.—On Thursday, August 1st, between thirty and forty members attended a reception at the London Temperance Hospital, Hampstead Road. Dr. Long Fox, a Vice-President of the British Medical Temperance Association, received the guests on behalf of the President (Sir E. W. Richardson), who was unable to be present. The hospital was inspected, and various interesting cases shown by Dr. W. J. Collins, Dr. Fletcher Little, and Dr. Ridge, members of the staff. After refreshments a short meeting was held, Dr. Long Fox presiding, who said that that hospital was a great object lesson, not only because its success would compare favourably with other hospitals, but because its experience proved the truth which all physiologists would support that alcohol was neither a food nor a stimulant. Preventive medicine was the great feature of modern teaching, but while we fought against micro-organisms, on the other hand we encouraged the use of alcohol which injured the system far more. Greater efforts should be made to diminish the terrific death-rate from alcohol among doctors, who were bracketed with potboys. If abstinence were general there would be an enormous diminution of misery, poverty, and disease. Medical men should stand shoulder to shoulder with the clergy against this great evil. Drs. Collins, Norman Kerr, Fletcher Little, and Ridge also spoke.

Garden Party at Normansfield.—A most enjoyable afternoon was spent at Normansfield, Hampton Wick, on August 1st by all who availed themselves of the splendid hospitality of Dr. and Mrs. Langdon Down. Arrangements had been made to entertain 1,000 guests and invitations for that number were issued, but counter attractions elsewhere kept many away. The extensive grounds around the house, the appliances for education and pasture of its youthful inmates, and the whole working of this successful establishment were on view. Military bands were stationed in the gardens, a steam launch took parties of the guests for short trips upon the adjacent Thames, and in every way the kind host and hostess had thoughtfully provided for the amusement of their visitors.

Garden Party at Gaiders Hill.—Many hundreds of members and their ladies accepted the tempting invitation of Sir Spencer Wells, Bart., and Mrs. Wells to a garden party at Sir Spencer's beautiful residence on the northern slopes of Hampstead Heath; and all who made the journey were well repaid by the scene which met their view and the hospitality offered by the host and hostess. The extensive park-like grounds, studded with noble trees, were in the height of summer glory, and refreshed by the generous rains of the previous week. A military band was in attendance, and played a programme of music, and a performance on the organ in the house, at which Dr. F. T. Roberts also sang was greatly appreciated by the guests.

Children's Hospital.—On Thursday afternoon Mr. John H. Morgan, President of the Section of Diseases of Children, entertained about 150 members of the British Medical Association in the gardens of the Hospital for Sick Children, Great Ormond Street. Owing to the large demand for invitations, the number was with much regret limited owing to the fear of overcrowding the wards. Demonstrations of interesting cases were given by members of the staff, and

after inspecting the wards, which were prettily decorated with flowers, they were served with refreshments in the garden, where tables were laid out. A large number of ladies and several foreign visitors were present, and expressed their admiration of all the arrangements.

Among the other social events of the meeting must be mentioned highly successful garden parties given by the Baroness Burdett-Coutts at Holly Lodge, Highgate; by Mrs. Tuke at Chiswick House; and by Mr. and Mrs. Stacey at Elmshurst, Bruce Grove, Tottenham. Mrs. Griffith Wilkins's reception at 15, Hyde Park Street, was a brilliant affair, as was also Mrs. Stephen Mackenzie's evening party at her house in Cavendish Square; and those members who availed themselves of the facilities offered them for seeing the fireworks at the Crystal Palace on Thursday evening witnessed an effective display. Most of the Presidents of Sections entertained large parties at dinner from day to day during the meeting. Mr. Jonathan Hutchinson gave a smoking *conferenza* at the Clinical Museum, and a Masonic smoking concert was held at the Portman Rooms, Baker Street, by invitation of the Æsculapius Lodge and Chapter. Bro Jacob Pickett, M.D., W.M., filled the chair, and many well-known artistes contributed to the entertainment of a numerous company. A supper followed by a highly successful entertainment was given on Saturday evening by the Savage Club, which extended the privileges of membership to all the foreign visitors during the week of the annual meeting.

DEMONSTRATIONS IN HOSPITALS AND INFIRMARIES.

CHARING CROSS.

On Thursday, August 1st, a clinical demonstration was given in the wards of Charing Cross Hospital between the hours of 2 and 4 P.M. by members of the medical and surgical staff of the hospital. It was largely attended by members of the British Medical Association, and much interest was evinced in several of the cases, which were selected with a view to demonstrate either typical examples of disease or to show the results of the more recent improvements in medical and surgical treatment. The cases were so numerous and important that it would be impossible to describe them individually. We therefore select a few examples which came more particularly under our notice.

In the medical wards Dr. T. Henry Green demonstrated a case of uncomplicated aortic obstruction in a girl, 25 years of age, the result of acute rheumatism; also a case of post-diphtheritic paralysis of the ciliary muscle and of the soft palate, accompanied by marked loss of co-ordination and delayed appreciation of sensation in the lower limbs.

Dr. Mitchell Bruce showed a case of locomotor ataxy in a woman, 42 years of age, presenting all the classical symptoms of the disease; also a case of aneurysm of the transverse part of the arch of the aorta, which had been treated by diet and rest since January 23rd, 1893. Since March 5th, 1895, this patient has taken with comfort a diet never exceeding that suggested by Tufnell. The aneurysm now shows diminution in size and very marked diminution in pulsation, the patient being in good health.

In Dr. Abercrombie's wards a most interesting case was shown. A man, aged 40, was admitted for "vomiting blood," and brought up 5½ pints of blood during one day whilst in the hospital under observation. Dr. Abercrombie regards a ruptured varicose œsophageal vein as being the source of the blood. Dr. Abercrombie demonstrated another interesting case of a male patient, aged 22, who suffers from congenital malformation of the heart, and in whom cyanosis and clubbing of the finger tips are well marked. There is a systolic murmur confined to the left infraclavicular region.

In the surgical wards the cases demonstrated were particularly numerous. We select for special notice only a few of the more noteworthy examples.

Mr. Bloxam showed a case of excision of both condyles of the lower jaw for ankylosis following traumatism. The operation was performed six months ago. The patient now has separation of an inch and a-half, thus being able to open the mouth very satisfactorily. There is, however, very little lateral movement.

Mr. John H. Morgan showed a female patient in perfect health after enucleation of a large hydatid cyst from the

liver. Also two cases of successful wiring of the patella, and one of the olecranon. In all three cases there was free movement of the neighbouring joint. Mr. Morgan further showed a case of imperforate anus with recto-vaginal fistula, which had been greatly improved by operation, the incus now passing almost entirely by the newly-formed anus. The child looked well, and Mr. Morgan intends to close the fistula by a further operation.

Mr. Stanley Boyd showed a series of cases of radical cure of hernia and operations for undescended testis. In all these cases the testis had been brought down to the scrotum, and had remained there for some time—in some instances three or four years. Also a case of naso-pharyngeal growth after operation, which had consisted in temporarily displacing one superior maxilla forwards and outwards, and by means of the room thus gained removing the growth from the body of the sphenoid. Further, a series of cases, among them a fractured os calcis and two excisions of the knee, in which "screwing" had been performed in place of wiring. Mr. Herbert F. Waterhouse showed a case of excision of the elbow in a girl, aged 24, for tuberculous disease of five years' duration. The movements of pronation and supination were perfect, those of extension and flexion nearly so. Also a case of orbital cellulitis, in which the protrusion of the eyeball had been extreme, the organ having been almost entirely outside the cavity of the orbit for several days. A nebula, the result of superficial corneal ulceration, somewhat impaired vision. There was no optic atrophy.

Our thanks are due to the medical and surgical registrars, Dr. H. D. Senior and Mr. Charles Gibbs, F.R.C.S., for aid in the compilation of these notes.

GUY'S.

On Friday afternoon about 150 members of the British Medical Association visited Guy's Hospital, and were conducted over the wards, college, museums, and laboratories by the staff and students. A number of interesting cases had been collected from the out-patient department, and cases in the wards were demonstrated by the members of the staff. Operations were performed in the theatre and eye wards, and demonstrations in operative dental surgery were made in the conservation room. In one of the rooms a collection of drawings by the hospital artist was shown, together with microscopical preparations and museum specimens. Messrs. Down Brothers exhibited surgical instruments. Refreshments were provided in the governors' committee room and in the reading room of the College.

DEMONSTRATION OF CASES OF WOUNDS AND ULCERS TREATED BY EXPOSURE TO OXYGEN GAS.

On Thursday, August 1st, at King's College, Dr. Stoker showed an interesting series of cases, either cured or in various stages of healing. He said there were several points of importance that must be borne in mind in considering these cases: 1. They were without exception cases in which every other form of treatment had been tried and had failed—rest, grafting, antiseptic applications, etc. 2. Cases in which the healing in some cases had been much more rapid than in others; that rapidity of healing was in direct relation with the healthiness of the surrounding skin and tissue. Healthy skin would not grow from unhealthy skin, and in some instances the first effect of oxygen was to increase the size of the ulcer till a healthy area was reached and then, and then only, new and healthy skin rapidly formed. 3. The bacteriological aspect of one case was surprising and rather upset one's preconceived ideas. 4. That the new skin and tissue formed by this system seemed different from the usual cicatricial tissue. There was no contraction, and in some instances it was difficult to say where the new skin began. Among the cases shown were: 1. A man, G. L., who had had a poisoned hand, with three ulcers, which had quite healed in three weeks, and left hardly any cicatrix. His hand became covered with hair. 2. A woman, M. W., who had had thirteen ulcers on her leg for four years, the result of typhoid fever. She was quite healed in nine weeks and had now been walking about for two months without any sign of recurrence. 3. A case of a girl, D. W., aged 16, whose back had been severely burnt last November. She had been six months in hospital with very little improvement. Under oxygen the ulcer was rapidly healing, being reduced in ten weeks from

9 by 10 to 3 by 5. 4. A woman, aged 71 years, who had had an annular ulcer on her leg for thirty years. She had rest in bed for three years and nine months, with various treatments. In six weeks under oxygen treatment the upper and lower borders had joined in three places, one place being 2 inches wide. 5. A woman, M. S., who had ulcers in either leg just above the ankle. That in the right leg had been in existence for fourteen years, that in the left for four. The ulcer on the left leg was being treated by the ordinary antiseptic method, and was not healing at the edges, though the surface of the ulcer had become more healthy. The ulcer was absolutely aseptic. The ulcer on the right leg was being treated by oxygen, and was rapidly decreasing in size; the pus was full of all kinds of micrococci. 6. A girl, J. M., who had been bald for one year (from alopecia areata). In view of the remarkable growth of hair seen in case No. 1, it was decided to try oxygen to make the hair grow in this case. She was fitted with an india-rubber nightcap, which was filled with pure oxygen twice daily, with the result that in two months her hair grew 2 inches long and is now daily increasing. The hair was at first white, but was now becoming pigmented. Many other interesting cases were shown, and the various apparatus applied and explained. Dr. Stoker pointed out that in the infirmaries all over the Kingdom there were hundreds of cases of chronic ulcers occurring in persons who were otherwise able and willing to work, but who by reason of these ulcers were thrown on the rates, and cost the ratepayers a large sum. He had shown that these cases were easily healed by the oxygen treatment, and commended the system to all Boards of Guardians.

LOCK HOSPITAL.

The members of the British Medical Association visited the Lock Hospital, Harrow Road, on Thursday, August 1st, where they were entertained by Mr. Buxton Shillitoe and Mr. Edward Cotterell. Mr. Shillitoe gave a short demonstration with special reference to the changes that the treatment of venereal disease has undergone in recent times. Many interesting cases of syphilis in its various stages were shown to the visitors.

ST. PETER'S.

Demonstrations were given on Tuesday and Wednesday. Mr. Hurry Fenwick performed suprapubic cystotomy upon a patient who had applied three years previously to him for the relief of a severe left renal pain. The patient had been then cystoscoped (1892), and the cause for the renal symptoms had been discovered to be the pressure on the lower part of the left ureter of an encysted bladder stone of very small size. The nose of the calculus was all that was then visible, and it was about the size of the point of a knitting needle. As the symptoms had vanished after the cystoscopy, the case was published in its unfinished state (*Cardinal Symptoms of Urinary Disease*, 1893, p. 218). For three years the patient had remained well. Two weeks before the meeting sudden acute obstructive pyelitis had set in, and the bladder was opened on July 31st in order to remove the pressure on the left ureter by extracting the stone from its encysted position in the left wall of the bladder. The viscous was capacious. Few of the medical men present could feel the probe-pierced opening into the sac, though the ill-defined hardness of the stone in the subjacent sac was detected by all. The posterior wall was incised through the suprapubic incision over the hardness, and a large encysted stone was with difficulty removed. Mr. Fenwick showed a stone which he had removed in a similar case (*Clinical Transactions*, vol. xxiii, the extraction having been aided by cutting it up with a chisel and mallet. Patients were then cystoscoped, and various forms of vesical papillomata were demonstrated. A series of kidney cases were also shown.

ST. THOMAS'S.

On Thursday, August 1st, the treasurer of St. Thomas's Hospital gave a garden party to the members of the Association. As the day proved very fine, about 600 people accepted the treasurer's hospitality. All parts of the hospital and school were thrown open for the inspection of the visitors, but perhaps the larger number preferred promenading about the terraces listening to the strains of a band. To the members, the staff exhibited and demonstrated on a number of very interesting cases. Among these were cases of acromi-

galy, leucocythæmia in a child, urticaria pigmentosa, dwarf from fragilis ossium, traumatic meningocoele, a series illustrating disease of knee-joints in congenital syphilis, leontiasis ossis, symmetrical hypertrophy of breasts in a girl of 16, and others.

THROAT HOSPITAL, GOLDEN SQUARE.

On Wednesday, July 31st, Dr. J. W. Bond showed two cases of excision of larynx, both patients sufficiently well to perform their ordinary work. Also three cases of sarcoma of tonsil after operation, and a case of sarcoma of the palate operated on two years ago. Also two cases of malignant nasal polypi. Also six cases after operation for middle-ear disease, in which the antrum, attic, middle ear, and external meatus had been thrown into one cavity. Mr. Harvey showed: (1) A case of excision of larynx for epithelioma, the patient able to perform his work. (2) A case of malignant (?) disease of nose septum. (3) A case of malignant goitre, etc. Mr. Lake showed: (1) A case of successful thyrotomy for malignant disease. (2) A case of frontal sinus disease after operation, etc. Mr. Parker showed cases of lupus of larynx, sarcoma of naso-pharynx, gumma of nasal septum, double abductor paralysis, etc.

DEMONSTRATIONS IN THE PUBLIC HEALTH SECTION.

Pasteur Filters.—A number of members visited the premises of Messrs. Debenham and Freebody, and inspected their installation of Pasteur filters. By means of this an ample supply of filtered water is provided for their enormous staff, amounting to close on a thousand persons; and no trouble of any kind is found in the working. The installation was of a compact and convenient character, and should serve as an object lesson to those who are under the impression that the Pasteur filter is a laboratory apparatus capable only of yielding minute quantities of water.

Disinfectant Spray.—During the meeting Mr. Wolf Defties gave demonstrations, by request of the Committee, in regard to the Equifex disinfectant spray, which, though new to this country, has been used for some years with great success in France and elsewhere. Mr. Defties showed that by means of the arrangements for providing a minute spray and distributing it by a stream of air, of which the strength can be regulated, a dew or cloud of liquid disinfectant is produced over the whole of the surface to be disinfected, which dries off slowly in the saturated atmosphere created by the process, while not injuring even those surfaces which most readily suffer, such as either common wall papers or rich plushes, of both which samples were sprayed and exhibited.

THE PRESS AND THE ANNUAL MEETING.

In concluding the reports of the proceedings of the meeting of the British Medical Association, the *Times* says:

"The proceedings of the Association were brought to a conclusion yesterday, after a meeting which has surpassed all its predecessors in point of numbers, and by common consent has in all respects been most successful. The organisation has throughout been admirable. The comfort of the visitors was amply provided for, and the entertainments, public and private, have been so many that no one could have needed himself of more than a portion of them. Every courtesy was afforded to the reporters, and particular acknowledgment is due in this respect to Mr. Andrew Clark, Dr. Jeanbard Owen, Dr. Dawson Williams, and Mr. Francis Foxton."

The *Daily Chronicle* says:

"From every side the opinion is expressed that the London meeting of the British Medical Association has been a great and unqualified success. Not less than that it must have been, in any case, if only because the social side of the gathering was admirably organised, and the practical details of the sectional meetings considered with due regard to the comfort and convenience of members."

The *Speaker* for August 3rd contains the following:

"Never was there a time in the history of the world when the art of medicine enjoyed so much consideration as at the present day; and the British Medical Association, which has

been in congress this week, has had plenty of material wherewith to reward the public attention which it was certain to attract. The Presidential Address gave an encouraging account of the progress of medical knowledge since the Association last met in London two-and-twenty years ago. There is a marvellous improvement in teaching, an immense increase in real knowledge—indeed, the medical science of 1873 seems, from Sir Russell Reynolds's description, to have too often resembled an imperfect and unsteady bridge over a bottomless quagmire—and an extraordinary extension of the means of cure. Our physicians have now whole departments of knowledge open to them that were hidden from their predecessors; for instance, as to the functions of obscure and minor organs in the human body, their inter-relation with the rest of the system, and the means of supplying their absence through the medium of food. But few things are more notable than the growth of the science of public health—which, as Mr. Ernest Hart reminds us, is wholly English in its inception and development—and the extraordinary extension of that other branch of preventive medicine in which, though its later accretions are due to French and German influence, the impulse was given by the work of Jenner. Sir Russell Reynolds wound up his address by some valuable words on the moral influence of the medical profession. For many a family, he might have said, the physician has taken more than the place Comte claimed for him. He is their only spiritual adviser; the only recipient of confessions and family secrets; the only outsider likely to speak with effect. It is fortunate that this year no speaker at the Association has presumed on this position of authority. For example, the treatment the higher education of women has sometimes received at these congresses is a proof that the medical calling has its mental limitations no less than the sacerdotal."

MEDICAL SICKNESS, ANNUITY, AND LIFE ASSURANCE SOCIETY.

THE twelfth annual meeting of the Medical Sickness, Annuity, and Life Assurance Society was held in the Ethical Section Room, King's College, on Wednesday, July 31st; Dr. DE HAVILLAND HALL in the chair.

Among those present were: Dr. de Havilland Hall, London; Dr. J. Brindley James, London; Dr. F. Wallace, London; Dr. Walter Smith, London; Dr. P. James, London; Dr. J. Pickett, London; Dr. T. V. Jackson, Wolverhampton; Dr. R. E. Yelf, Moreton-in-Marsh; Dr. W. T. Evans, Baywater; Dr. W. K. Sibley, London; Dr. A. R. F. Evershed, Penzance; Dr. G. St. George, Lisburn; Dr. F. D. Grayson, Raleigh; Dr. E. Bartlett, London; Dr. J. B. Ball, London; Dr. R. J. Pye-Smith, Sheffield; Dr. F. A. Parcell, London; Dr. J. K. Brigham, London; Dr. C. Porter, Stockport; Dr. N. W. Barrington, Bexley Heath; Dr. Stewart Low, London; Dr. T. Davies, Liverpool; Dr. F. J. Allan, London; Dr. Hugh Jones, Dolgelly; Mr. C. H. W. Parkinson, Wimborne Minster; Dr. W. H. Day, London; Dr. W. Bartlett, Bideford; Dr. J. W. Mason, London; Dr. O. H. Wise, Walthamstow; Dr. D. M. Wilson, Edmonton; Dr. J. Heath, Edmonton; Dr. D. de Vere Hunt, Cardiff; Dr. Costelloe, Galway; Dr. G. Stoker, Dublin; Dr. R. H. Barkwell, London; Dr. Macdonald, Bristol.

In his address, Dr. DE HAVILLAND HALL, the Chairman, said he would take the earliest opportunity of thanking the members for the honour they had done him last year in electing him Chairman. The retirement of Mr. Ernest Hart from this position was a great loss to them, for he had always brought to bear upon their interests his great business and financial knowledge. Mr. Ernest Hart had, however, occupied the position of President of the Society, so they still had the command of his services, and quite recently he had been of great use to them, and had shown that they might continue to count upon his kindly interest in their affairs. The Society having been founded in 1881 was now in the twelfth year of its existence, and he was sure that the members would agree with him that of the many benefits Mr. Ernest Hart had conferred upon the profession, there was none greater than the part he took in founding this Society. He was glad to say that there was a continued addition to the number of the members, the funds were steadily growing, and the

ever-increasing demand upon the sickness fund was good evidence of the success of the business. During the first year after the institution of the Society less than a thousand pounds was paid in sickness claims, while last year the amount was more than four times as much—namely, £4,399. The members would see that this was a very large increase in usefulness and a considerable addition to the work of management thrown upon the shoulders of the members of the Committee. That there was a very great need of such a Society as this in the profession was admitted on all sides, and although their numbers had rapidly grown, he did not think they should rest satisfied till they had within their ranks something like 5,000 members. Then, perhaps, they might be content to rest for a while. During the year £5,000, out of a surplus of £7,137 shown at the last valuation, had been distributed as bonuses to members of the sickness branch, and this distribution, he trusted, gave satisfaction to the members. The expenses of management were still kept well within 5 per cent of the premium income, which was rather less than half the amount—namely, 10 per cent.—allowed by the actuary for the working of the society. When they compared the cost with which their business had been worked with the experience of older companies, they would see how much was saved by the voluntary work of the committees. A very useful suggestion made by Mr. Ernest Hart some two years ago was the formation of what was called the "investment fluctuation reserve fund"—that was to say, all interest received over 2½ per cent., the rate assumed in the valuation, was put by in a separate fund, and that fund had now reached £1,325. As they had before them the list of sickness claims paid within the last twelve months it would be quite unnecessary to speak further on the advantages of the Society. Taking, for instance, the first on the list, a member who was suffering from locomotor ataxy. He had been on he (the Chairman) believed ten years. A year or two ago his brother (a clergyman) had told him that if it had not been for the Society he would have been in the workhouse. Such a case as that was in itself sufficient to establish the utility of the Society. There was one point in the operations of the past year which had been to him a source of gratification, and that was that the Committee had consented to vote a sum of 20 guineas a year to the Royal Medical Benevolent Fund. It was felt that with the surplus the Society possessed it was desirable to do all they could to assist their brethren in the battle of life and that they might also have a kindly thought for their children, so the Committee agreed to subscribe, and he hoped the members would endorse their action. They subscribed on the understanding that the votes should be given to the children of deceased members. At the last election the children of three deceased members came up, the votes were equally divided, and he was glad to say that one of the three was admitted into Epsom on his first application. So it would be seen that not only was the Society benefitting the members still alive, but even after their death there were still benefits which might accrue to their children. The next point was certain alterations in the rules, which the Committee recommended as essential to the welfare of the Society. The details were in the hands of the meeting. He would urge upon every member of the Society that they should do their utmost to induce their friends to join it, as the more members there were the less in proportion would be the cost of carrying on the business. He had much pleasure in moving:

That the annual report be received and adopted.

The resolution, on being put to the meeting, was carried unanimously.

Several matters relative to the bonuses of the Society being reserved, and constituting a provision for old age, and as to voting by proxy were referred to the Committee for consideration.

Mr. T. V. JACKSON moved the following resolution:

That the officers and members of the Committee as per list be and are hereby elected.

This was seconded by Mr. BRINDLEY JAMES, and carried unanimously.

Dr. EVANS proposed a vote of thanks to the officers and committee of the Society, which was carried unanimously.

Dr. BALL, in replying on behalf of the officers, said he

begged to return thanks for the vote which had just been passed. The work they did was a great pleasure to them; it was a labour of love.

Dr. BOLT said he would ask the members to endorse a vote of thanks to the *BRITISH MEDICAL JOURNAL* for the very ample advertisement and the very useful help given to the Society by the *JOURNAL*. He might say that were it not for this advertisement their expenses would be much larger. He was sure that there was no occasion to say how thoroughly and earnestly Mr. Hart felt in regard to the Society, and although he was not actually at their head, he was quite certain he was thinking of them at the present time.

Dr. HUNT said he had much pleasure in seconding the resolution, as he knew the great interest Mr. Hart took in the Society.

The resolution, on being put to the meeting, was carried unanimously.

A vote of thanks to the Chairman, proposed by Mr. BRINDLEY JAMES, seconded by Dr. WISE, which was carried with acclamation, brought the meeting to a close.

ROYAL COLLEGE OF SURGEONS.

An ordinary meeting of the Council was held at the College on Monday, July 23rd. Mr. HEATH was in the chair, and the minutes of the last quarterly meeting were read and confirmed.

A report was received from the Finance Committee stating that the College accounts for the year ending Midsummer, 1895, had been duly audited and that the usual statement of receipts and expenditure had been signed by them.

The Committee on the proposed arrangements for the Third and Fourth Examinations recommended that no separate examination in Ophthalmic Surgery should be instituted, and that they should be authorised to consider and report upon the general scheme of examinations as well as upon the details, and that they should further be authorised to consult the medical schools if they should think it desirable.

A letter was read from the Royal College of Physicians, stating that the petition from the London School of Medicine for Women had not been referred to a committee for report, but that its consideration had been proposed to a special meeting of the College in the autumn. It was resolved that the resolution referring this petition to the Committee of Management of the College of Surgeons be rescinded, and that the petition be considered by the Council on November 14th.

The following motion was also carried:—

That the question of the admission of women to the Conjoint Examinations for the diploma of Membership be submitted to the next meeting of Fellows and Members on November 14th, 1895.

The Secretary reported the presentation to the College by Mr. Jabez Hogg of 16 daguerreotypes of physicians, surgeons, and others, mostly taken by himself in "the early forties," of 9 volumes of scientific pamphlets, and of a portrait in oil of a surgeon (name unknown), date, 1677. The best thanks of the Council were given to Mr. Jabez Hogg for his valuable donation.

The following resolution was received from the Association of Fellows:

That the attention of the President and Council of the Royal College of Surgeons, England, be drawn to the fact that the half-yearly meeting of the Fellows on July 4th was closed without any discussion being possible in respect to the business on the agenda; and that, in the opinion of the Committee of the Association of Fellows, such a mode of conducting these meetings would be destructive of the privileges conceded by the Council to the Fellows, and would render their meetings nugatory.

The Council resolved that, in reply to the Association, they wished to point out that the meeting of Fellows was held and conducted in strict accordance with the regulations appertaining to the meeting; and that, as there were no notices of motion on the agenda, no discussion could properly take place, the regulations of the meeting requiring previous notice of twenty-one days.

UNIVERSITY OF EDINBURGH.—The graduation ceremonial in medicine, science, and law, of the University of Edinburgh, took place on Thursday, August 1st.

BATHS AND HEALTH RESORTS OF THE UNITED KINGDOM.

THE REPORT OF THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY.¹

(Concluded from page 234.)

II.

Dr. MITCHELL BRUCE also furnishes the reports on the climate of Dorset and Hampshire. In the former he has little to say about the county as a whole, confining himself to descriptions of the principal health resorts. Of these, Shaftesbury is said to be suitable for persons in want of a bracing country holiday; it is also on its trial as a hill station for tuberculous subjects during the summer and autumn months. The climatic merits of Weymouth and Swanage are conscientiously appraised. In treating of Hampshire, Dr. Mitchell Bruce is moved to unwonted enthusiasm in speaking of the charms of the New Forest, which he describes as "peculiarly adapted as a health resort in convalescence from acute disease; as a retreat in certain nervous diseases and some forms of neurasthenia; as a place for a quiet holiday in early spring and summer for the town dweller." Bournemouth naturally receives a good deal of attention. While the great natural advantages of its situation and climate are ungrudgingly admitted, it is pointed out that, like many other prosperous health resorts, it is increasing too rapidly in area and polluting its atmosphere with smoke. This we take it is one of the chief reasons why people go abroad in search of what they might easily find near home were not the trail of the speculative builder over nearly every spot in this country which Nature had intended for a place of rest, amid pure air and beautiful scenery. The Isle of Wight receives its due meed of discriminating praise. Here, as at other seaside places, the prevalence of anemia among young girls of the well-to-do as well as of the poorer classes seems to have struck most observers.

Dr. W. Ewart deals exhaustively with the climate of the south-eastern counties, comparing it with that of Cornwall, which, though warmer and more equable, is more relaxing. The therapeutic value of the south-eastern district is summed up in the statement that while famed for the relief of many ailments, it is not the special home of any. Again, the special virtue of its inland as compared with its marine climates is indicated epigrammatically as follows: "Inland is the place to enjoy health, the seacoast to make it." In general all conditions of delicacy, and therefore of irritability of tissues or of functions, are best suited by the south coast; whilst torpor in all its forms, and debility associated with nervous depression or loss of tone, are benefited by the quickening influence of the northern, and especially of the eastern, coast of Kent. Dr. Ewart also treats of Surrey, Sussex, and Kent separately, the geology, physical characters, and climatology of each county being described and compared with a fulness and elaboration which are likely to have a somewhat confusing effect on the mind of a hasty reader. The health resorts in each of the three counties are also described at considerable length, the local reporters in not a few instances being allowed to speak for themselves, and availing themselves freely of the privilege. Hence the reports are unequal in merit, in some cases (among which we may note the report of the Brighton and Sussex Medical-Chirurgical Society on Brighton, that of the East Sussex Medical-Chirurgical Society on Hastings and St. Leonards, and that of Dr. R. L. Bowles on Folkestone) being really instructive and helpful, while others are little above the level of the ordinary guidebook.

Only about one-sixth of the book is devoted to medicinal springs. Dr. Ord, in his "Introductory Remarks" while patriotically standing up for our British spas, has to admit that besides the general inferiority of the waters in richness of mineral constituents, such advantages as they possess are seriously handicapped by our climate. He adds that in our watering places "the resources of Nature are not on the whole sufficiently utilized"—surely a very mild way of charac-

terising the pitiful lack of enterprise shown by the persons in whose hands is the direction of affairs at most of our spas. Bath and Buxton are described by Dr. Ord and Dr. A. E. Garrod. Dr. Garrod is also the *rates sacer* of Matlock, Bakewell, Stoney Middleton, Droghda, Nantwich, Leamington, Cheltenham, and Tunbridge Wells. Mr. Malcolm Morris and Dr. F. Penrose treat of Harrogate and Strathpeffer, Mr. Morris adding a brief note on Moffat; Dr. Robert Barnes gives an account of Woodhall Spa; and Dr. Frederick Roberts hymns the praises of the healing springs of Wales—Llandrindod, Llanwrtyd, Llangammarch, and Builth. Brief descriptions are also given by anonymous writers of Askrigg Spa, Stafford and Saltburn-on-Sea, and Ashby-de-la-Zouch. The therapeutic effects of the various spas are clearly indicated, and the credulity of the reader is never taxed by exaggerated statements of the thauumatargic virtues of any waters in all diseases.

The work contains a large number of meteorological and statistical tables, an excellent map of the South of England, with contours, winter isotherms, etc., and a very full index. The few errors which we have succeeded in discovering are quite unimportant, and Dr. Archibald Garrod deserves the greatest praise for the zeal and diligence with which he has discharged his responsible duties as editor.

To sum up: In this work the medical profession has not only a storehouse of carefully sifted information on the climate of the South of England, on the health resorts of that part of the kingdom, and on the chief medicinal springs of Great Britain, but an authoritative exposition of the therapeutic effects of these places and a trustworthy guide to their use whether in the way of treatment or for holiday purposes. The information in some parts of the work might have been conveyed in a somewhat less austere form, but perhaps the august society under whose auspices it is published may have thought that its dignity would suffer from the slightest appearance of bending the literary knee to the Baal of popularity.

SIDMOUTH.

MR. ROBERT F. MCARDLE (Stoke-on-Trent), writes in praise of Sidmouth, on the coast of South Devon, where, after an accident, he recently spent some time. He recommends the climate as equable—cool in summer, and warm in winter. The mean temperatures of London, Bournemouth, and Sidmouth, are shown in the following table:

Winter.

	Jan.	Feb.	March.	Oct.	Nov.	Dec.
Sidmouth	40.8	41.0	41.9	50.1	45.3	41.5
Bournemouth	39.9	40.4	41.5	49.5	45.6	40.2
London	39.4	39.3	41.4	48.7	44.3	38.3

Summer.

	May.	June.	July.	August.	Sept.
London	53.5	59.3	62.4	61.4	57.3
Bournemouth	52.1	57.5	60.5	60.6	57.0
Sidmouth	51.5	56.7	59.4	59.3	56.4

The number of hours of sunshine in winter is high as compared with the record in other south-coast stations, while as compared with northern stations the record is (October to March): Sidmouth, 560 hours; northern stations, 340 hours. The scenery is beautiful, the red cliffs contrasting with the luxuriant vegetation. For amusements there are golf, cricket, and boating; and steamboats run to Torquay and Bournemouth.

New baths were opened in May, and are provided with sea and fresh water in any proportions and at any temperature. The baths are well fitted, and the Nauheim treatment can be applied. Massage and douche baths can also be obtained, and adjoining the baths is a comfortable club.

¹ The Climate and Baths of Great Britain, being the Report of a Committee of the Royal Medical and Chirurgical Society of London. Vol. I.—The Climate of the South of England, and the Chief Medical Springs of Great Britain. London and New York: Macmillan and Co. 1896. Penny two. 25s. net.

bourhood surrounding this bath, as well as an account of the composition and characters of the spring itself. This mineral spring is rich in iron, and contains also small quantities of manganese, arsenic, and lithium, together with much calcium and magnesium sulphate. The water is warm, and is used—as well as the red mud it deposits—for baths, especially in skin affections, and it is drunk also in these and other maladies of a debilitating and anæmic type. An excellent map of the locality and some good plates illustrate the text.

THE CANARY ISLANDS AS A WINTER RESORT.

Mr. C. A. GRIFFITHS, F.R.C.S., of Cardiff, sends us a few notes of a three months' residence last winter in the Canaries. Mr. Griffiths left England early in February last for Santa Cruz, the chief town and harbour of Teneriffe, and travelled thence by carriage to Orotava. He found the climate remarkably equable. The days as a rule were fine and sunny, and even at the end of April, when the heat was getting more intense, they were never sultry. The nights were pleasantly cool, but not cold enough to prevent sitting out in the open air. He complains that the streets are dirty and ill-paved, and the sanitary arrangements primitive, "the porous nature of the volcanic soil being made to do duty for the drainage pipes of more modern and civilised communities." Mr. Griffiths thinks "A great point in favour of the Canaries as a winter resort is that invalids can spend the greater part of their time in the open air. The more weakly can be carried about in hammocks, go for drives, or lie about on the *patios* of their hotels, while the more robust can go in for walking, lawn tennis, riding, sea fishing, etc. He points out that in this climate sea bathing can be indulged in even in winter, and also mountain climbing, from the smaller hills to the snow-capped peaks. Choice of residences can also be made from the sea level to four or five thousand feet above it. The town residents retire to these mountain resorts in the summer months. He found, even in advanced cases of phthisis, the equable climate very acceptable; and for "milder cases" he thought it "little short of perfection." He estimates the cost of living at the English hotels at 10s. or 12s. a day.

SOCIETY OF MEDICAL PHONOGRAPHERS.

THE first general meeting of the members of this Society was held on July 30th at 29, Hanover Square, W., when there was a very fair attendance of members and visitors, the latter including Sir Henry Howorth, M.P., F.R.S., and Sir William Broadbent.

The chair was occupied by Dr. Gowers, F.R.S., first president and founder, who gave an inaugural address, which will be subsequently published. Supporting him were Dr. Gray, Oxford (Treasurer), and Dr. Nell (Secretary). Letters were read from General Sir C. Wilson speaking of the recognised value of shorthand to staff officers; from Dr. J. H. Gladstone, who has used shorthand constantly in science since 1840, and invariably employs it for recording observations and preliminary writing; and from the Bishop of Hereford, who said the establishment of the Society of Medical Phonographers was an event of no small importance. It would do a great deal to popularise the study in all our higher schools, as it would help to brush away the prejudice that shorthand was chiefly useful for trade purposes, and might be neglected by the profession without loss.

Sir Henry Howorth, in responding to the President's invitation, said that in writing his books his great despair and difficulty had been the copying down verbatim, in the ordinary writing, the material from a very wide field, pertinent to the subject. Had he been able to use shorthand in the process he would have spared his eyes and saved both time and temper. He felt so strongly on the matter that he was insisting on his boys learning the art. He referred to the great use made of the art by the President in the compilation of his published works, and went on to speak of the value of the phonetic principle. In conclusion, he considered the President a great evangelist in the movement, and spoke in flattering terms of the *Phonographic Quarterly Review*.

Sir WILLIAM BROADBENT said he was present to testify to his sympathy with the work of the Society, and he agreed

with every word of the Presidential address. He also had to look back with regret to the fact that he did not persevere sufficiently with his shorthand to make use of it, but he recognised to the full the utility of the art for taking notes at the bedside. In some cases circumstances were such that record at the moment in the ordinary longhand was impossible, whereas with shorthand no postponement was necessary, so that both vividness and accuracy were preserved. He could only look forward to the time when it would be the rule that all men who seriously worked in the cause of hospitals would make use of that very great advantage. He wished the Society success, and felt sure it would be extremely useful to the medical profession.

Mr. THOMSON (Dublin) said he was an old shorthand writer, and could testify to the value of the art in one's work. He thought the sphere of the Society would extend from day to day. He did not agree that there was an age beyond which shorthand could not be learned, and felt sure that if the last speaker would give a daily hour to the study for a few weeks he would acquire sufficient facility to make use of it at least for private cases.

The PRESIDENT stated that Dr. Langdon, of Cincinnati, who was 45 years of age, obtained in a fortnight sufficient power to write a letter which he (Dr. Gowers) could read as swiftly as he could speak.

BRITISH PHARMACEUTICAL CONFERENCE.

THE meeting held last week at Bournemouth, under the presidency of Mr. N. H. MARTIN, of Newcastle-on-Tyne, though not so largely attended as some previous meetings, was in every respect a marked success. The arrangements made by the local Committee were thoroughly well devised and efficiently carried out. As in the previous year of Mr. Martin's presidency his address was mainly devoted to the consideration of various influences tending to promote or obstruct the development of a professional spirit among those engaged in the practice of pharmacy. Regarding that occupation as necessitating acquaintance with various branches of science and as being definable in the same manner as the practice of medicine, Mr. Martin forms a high estimate of the functions and duties appertaining to it. From that point of view he considers that at the present moment the position of pharmacy in this country is most unsatisfactory, for while on the one hand pharmaceutical science is sneered at and flouted by false assumption and pretence the whirlwind of modern trade threatens to extinguish the true art of pharmacy. That there is much to justify such a view of the situation cannot be denied, and in some respects Mr. Martin's protest against exaggerated scientific pretension is no less timely than that against the practice of "the baser methods of trade." But while making that admission the fact must not be overlooked that the higher and more professional practice of the art of pharmacy is almost invariably associated with an essentially trade factor which cannot in any case be neglected and is sometimes the pharmacist's chief means of existence. The ills and hardships experienced by those engaged in the business of pharmacy are not to be remedied by deceiving the trade part of their business but by convincing the public that their qualification for performing its higher duties is also essential for the proper conduct of the trade they carry on.

There is no other basis on which pharmacists can hope for protection and advancement in regard either to their trade or to their more professional work. That may be regarded as the real purport of Mr. Martin's remarks, and among the means by which the desired result is to be attained, there is none likely to be so effective as the organised association of those engaged in the business. Since the foundation of the Pharmaceutical Society the recognition of that principle has extended, and found expression in the formation of local associations, and of the British Pharmaceutical Conference itself. Of late years further evidence of this tendency has been given by the project of federating local associations, but it is strange that the advantages offered for this purpose by the Pharmaceutical Society are still to a large extent overlooked. In referring to this point, Mr. Martin mentioned the benefits which have been derived from the British Medical Association as a general organised representative of the medical profession, and strongly urged the desirability of

a similar association for pharmacy on the basis of membership of the Pharmaceutical Society. Until such a general organisation of persons engaged in the business is effected, improvement in the position of pharmacy and of its followers cannot be looked for, and amendment of the Pharmacy Acts will be limited to matters which affect the public interest only. The great want of an adequate system of scientific education and technical training as a necessary preliminary to qualification is one which must be provided for by those engaged in the practice of pharmacy from a conviction that it is the only means of securing for themselves advancement and the protection which they find to be necessary.

The papers read at the several sections of the Conference dealt with a number of subjects of pharmaceutical interest, but they were not equal in importance to those of previous years. The remarks on the *British Pharmacopœia* by Dr. Charles Symes, of Liverpool, were directed towards securing for that work more general recognition by prescribers not only at home but also in the colonies. He advocated the introduction of the metric system of weights and measures as well as its extension to doses by giving the equivalents of the doses stated according to the present system, and suggested that new drugs under trial and old ones becoming obsolete should be included in a secondary list, so as to avoid too frequent changes in the body of the work.

The social features of the meeting were particularly agreeable, the headquarters of the Conference being the Mont Dore Hotel, where the President held a reception on Monday evening. The excursions to Swanage and to the New Forest, as well as the garden party concert in the winter garden of the hotel, and the smoking concert on Wednesday evening, afforded much enjoyment and satisfaction.

DEATH UNDER ANÆSTHETICS.

CHLOROFORM.

We are indebted to Dr. Duff (St. John's, S.E.) for the report of a case of death under chloroform which occurred in his practice. He writes: H. W., an infant 12 days old, was brought to me on July 6th by the nurse who had been attending the mother during her confinement, to see what could be done to stop the convulsions and difficulty of micturition from which the child had been suffering. On examining the child I found the prepuce all but imperforate, hardly permitting the passage of a probe, the orifice being further closed by a flap of mucous membrane acting as a valve inside. I recommended circumcision, which was accordingly done at the District Home of the Nursing Sisters of St. John the Divine on July 8th. Chloroform was administered, which the child took well, and was sent home to be dressed daily, and brought up again if necessary. On the 15th the child was again brought, as there had been some hæmorrhage. I found that the stitch on the dorsum had cut its way out, allowing the skin of the penis to come forward on the glands, forming extensive adhesions. I told the mother to bring up the child next day to the District Home in order that I might put this right. She accordingly did so, and I again administered chloroform, which the child took as well as on the previous occasion, I then broke down the adhesions with the probe, trimmed and stitched the skin to the corona. I had finished bandaging and was giving some directions to the mother when the sister in charge called my attention to the fact that the child, who had been coming to nicely, had ceased breathing. I found the pulse still beating, but the child never revived in spite of the application of the battery, artificial respiration, etc. After the child's death I was informed by the father that another child of his, aged 8 months, had died in hospital under chloroform after a minor operation—a fact which would, if I had known it previously, have effectually prevented me from giving chloroform at all for so slight an operation as circumcision. At the *post-mortem* examination the body was found to be emaciated, but no organic lesion present. I cannot of course vouch for the accuracy of the parent's statement with regard to the other child's death, but if true it would seem to show that undue susceptibility to chloroform may, like other idiosyncrasies, run in families. In my own case the child, though fully, was never deeply under chloroform, the total amount given being about 3½ on a towel in a hot room.

MILKBORNE DISEASE:

AN APPEAL TO MEDICAL OFFICERS OF HEALTH.

MR. ERNEST HART is engaged on a general inquiry into milk-borne disease since 1881, in continuation of his paper of that year on the Influence of Milk in Spreading Zymotic Disease, and will be much obliged if those health officers who possess notes of outbreaks of disease traceable to the agency of milk will be good enough to furnish him with a brief statement of the facts, so far as known, in the shape of answers to the questions subjoined:

- | | |
|--|--|
| 1. Date. | 8. Number of such families invaded. |
| 2. Locality. | 9. Sanitary circumstances of farm or dairy from which milk was obtained. |
| 3. Reporter. | 10. Exciting cause of outbreak. |
| 4. Total number of cases. | 11. Circumstances implicating milk. |
| 5. Deaths. | 12. Facts showing special incidence of disease. |
| 6. Number of cases amongst drinkers of suspected milk. | 13. Reference to report. |
| 7. Number of persons supplied by milkman. | |

In addition to those whose names appeared in an earlier issue of the *BRITISH MEDICAL JOURNAL*, Mr. Ernest Hart desires to express his thanks to the following medical officers of health for the reports and information which they have kindly forwarded to him relative to the outbreaks of infectious diseases traceable to the agency of milk: Dr. Wm. Brown (Carlisle), Dr. Hiffe (Derby), Dr. Harvey Littlejohn (Edinburgh), Dr. Malet (Wolverhampton), Dr. Naemyth (co. Fife), Dr. Oliver (co. Roxburgh), Dr. Philpot (Croydon), Dr. Chas. Porter (Stockport), Dr. Sergeant (W. Lancs.), Dr. Walker (Spilsby Rural District), Dr. Whitelaw (Kirkintilloch), and Dr. Woodman (Exeter).

ASSOCIATION INTELLIGENCE.

NOTICE OF LAST QUARTERLY MEETING FOR 1895. ELECTION OF MEMBERS.

A MEETING of the Council will be held on October 23rd, 1895. Candidates for election by the Council of the Association must send in their forms of application to the General Secretary not later than twenty-one days before the meeting—namely, October 2nd, 1895.

Any qualified medical practitioner, not disqualified by any by-law of the Association, who shall be recommended as eligible by any three members, may be elected a member by the Council or by any recognised Branch Council.

Candidates seeking election by a Branch Council should apply to the Secretary of the Branch. No members can be elected by a Branch Council unless their names have been inserted in the circular summoning the meeting at which they seek election.

FRANCIS FOWKE, *General Secretary.*

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

MEMBERS are reminded that the Library and Writing Rooms of the Association are fitted up for the accommodation of the members in commodious apartments, at the offices of the Association, 429, Strand. The rooms are open from 10 A.M. to 5 P.M. Members can have their letters addressed to them at the Office.

BRANCH MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—The annual meeting, which was unavoidably postponed, will be held at Dumfries in the third week of August. Due notice will be given by circular.—J. ALTHAM, *Honorary Secretary*, Fenrith.

MIDLAND BRANCH: DERBYSHIRE DIVISION.—There will be a meeting at the Whitworth Institute, Darley Dale, on Thursday, September 6th. The President, Dr. Moxon, kindly invites the members to afternoon tea, and Lady Whitworth will throw open her gardens and grounds. Afterwards it is proposed to drive to Matlock Bath to dine at the New Bath Hotel. Members are requested to give notice of communications to be brought before the meeting before August 26th to J. A. BOUTHERN, *Honorary Secretary*, Friar Gate, Derby.

THE Norwich Corporation have conferred the honorary freedom of the city upon Sir Peter Eade, M.D., who is now serving the office of Mayor for the third time.

SPECIAL CORRESPONDENCE.

ST. PETERSBURG.

A New Disease.—A Vaccination Centenary and the Russian National Health Society.

AN article of considerable interest was published in the April number of the *Journal of General Hygiene* by Drs. Bieliavski and Riéshetnikof upon a hitherto little known disease, which they name *tarabagan* *tschuma*, that is to say, a plague or disease (*tschuma*) arising in connection with the *tarabagan*. The *tarabagan* is a rodent animal, closely allied to the marmot, and apparently of frequent occurrence in the Siberian province of Transbaikal, where all the cases of the disease in question have been met with. The authors of the article have collected twenty-six cases occurring in the Akshin *okrug* (or military district) of that province. They were distributed among six families, and occurred in the years 1888, 1889, 1891, and 1894. In addition, six corpses of Buriats (a Siberian tribe) were found in an earth hut, bearing signs of having died from this disease. That their death was so caused was confirmed by the fact that a medical man and a *feldscher*, who made necropsies on these bodies both contracted the disease and died from it. In fact, no case has yet been known of recovery from what appears to be one of the most malignant forms of disease yet observed. The symptoms are the following: The patient sickens with a feeling of heat and general feverishness; the temperature rises; there is giddiness, intense headache, flushing, restlessness, and distress. The pulse becomes rapid and weak. Some patients complain of oppression and pain in the chest, accompanied by occasional dry cough and scanty expectoration, which is sometimes tinged with blood. There is nausea, sometimes vomiting, and towards the end, which generally occurs on the second or third day, there may be diarrhoea. Weakness and general depression are marked features; consciousness remains more or less complete until death. The axillary glands may be swollen and red, but nothing is said as to the occurrence of suppuration. The incubation period seems to be from three to five days or more. As already stated, no case of recovery has yet been met with; death always occurred on the second or third day. This disease is regarded by the authors as a typical purely contagious disease. It can be contracted solely by coming into contact with the fluids escaping from the body of an animal who has died from it, or from using the flesh of such an animal in an insufficiently cooked state. In the same way it is transmitted from patient to patient only by direct contact with the fluid excreta, or with the liquids which escape from the body after death. It has never been contracted from the use of the dried skins of the *tarabagan*, nor of the melted fat of the animal. When the infectious fluids are dried, they also seem to lose their infective properties. The *tarabagan* is a hibernating animal; it sleeps from September to March. It is much hunted by the nomad Buriats and by the Cossack inhabitants of the Siberian steppes, who find its flesh a delicacy. Its fat is also greatly prized for greasing leather articles, straps, etc., and is also used for lighting purposes. In some years these animals sicken with some form of epizootic; they cease to bark, they become languid, and slow in their movements; they roll about like a drunken man, or lie half asleep on their earth mounds, and thus fall an easy prey to their enemies. Any human being who should now touch them would be certain to contract the fatal *tschuma*; on the other hand, animals of prey—wolves, foxes, or dogs—may eat the flesh from the bones with no bad result to themselves. No domestic animal has been known to contract the disease either from the *tarabagan* or from any of the human patients. The extreme danger of catching this disease is well known to the Siberians, and they are accordingly very careful in their dealings with the animals in question. This and the fact that most of the dead animals are at once torn to pieces by wolves or other beasts of prey, probably accounts for the comparative rarity of the disorder in man. The only earlier reference to it in print appears to be a short article in the *Zabaikalski Obshchestni Listnik* (Journal of the Transbaikal Province) for

1892, in the form of an official notice from the authorities warning the inhabitants against the disease.

The Russian National Health Society has selected May 2nd (14th) of next year as the day on which to commemorate the centenary of the introduction of vaccination. The Society intends to observe the centenary by offering four prizes for the best monographs upon vaccination; by publishing a history of the practice in Russia; by translating Jenner's works into Russian; and by holding an exhibition of objects connected with vaccination. The day itself will be kept by the holding of a special meeting of the Society.

NEW YORK.

The Meaning of "Percentage" in Medicated Dressings.—The Status of a Physician called to attend a Case of Criminal Abortion.—Isolation of a Leper.—Free Public Baths.—The American Medical Association.—The Gonococcus in the Male Urethra and the Vulvo-vaginal Tract of Children.

A CONTROVERSY between two prominent manufacturers of surgical dressings has directed attention to the meaning of the word "percentage" when used in reference to the proportion of a germicidal agent in such dressings. One party alleged that the strength of an antiseptic surgical dressing was measured by the strength of the solution with which the dressing was impregnated, without reference to the weight, bulk, or measure of the fabric which carried the antiseptic; in other words, a 5 per cent. carbolic gauze meant absorbent gauze impregnated with a 5 per cent. solution of carbolic acid, and a 1 in 1,000 corrosive sublimate gauze meant gauze impregnated with a 1 in 1,000 solution of corrosive sublimate. The other party held that the percentage strength of a prepared medicated dressing referred to or expressed the weight of the medicinal agent in 100 parts of the dried finished product—that is, free from alcohol, water, or any other menstruum for the antiseptic. While the majority of surgeons interviewed expressed their opinion that the latter definition was correct, there was a number of surgeons who held the contrary opinion. It would, therefore, seem to be desirable that the manufacturers of antiseptic dressings should explicitly state on the label of the package whether the percentage is that of the bulk of the dressing or of the strength of the solution with which the dressing is impregnated.

Mr. R. C. Taylor, the counsel of the Medical Society of the County of New York, has recently furnished that body with an opinion regarding the status of a physician who was called upon to attend a case of criminal miscarriage or abortion. Broadly stated, there is no definite or positive rule by which a physician may be guided in such a case, and the question is one of general good sense and prudence. Misprision or failure of an individual to report to the proper authorities any crime he has had reason to suspect, while a misdemeanour at common law, is not a crime under the penal code of New York. By no statute is it a physician's duty to report a case of illness which he suspects to involve criminal malpractice; consequently failure to make such a report does not render a medical man liable to any specific punishment. If, however, the patient should die, and the circumstances lead anyone to believe that malpractice has been committed, the physician runs a grave risk of suspicion of being accessory. The counsel advised that, as a physician cannot decline a call to attend an urgent case, if there is the slightest reason to believe that a criminal act has been committed or that death might ensue, it is his imperative duty to provide himself with the services of a consultant, whose evidence, added to his own, should suffice to prove the integrity and wisdom of the treatment. Further, if the patient is transferred to another physician or to a hospital, the physician and consultant should report the details of the treatment and communicate their suspicions. While by New York law a physician is incompetent to divulge information professionally acquired, nevertheless if he believe a criminal act has been performed, he should make a privileged communication to the coroner, thus casting upon that official the duty of ascertaining whether any crime was committed.

The New York Board of Health recently learned of the presence of a mild case of leprosy in the city, and exercising, in

the name of medical science, its prerogative of isolating persons affected with infectious diseases, at once separated the poor fellow from his friends and put him in an isolated hut on the island where the small-pox and typhus hospitals are located. This is on a par with the zeal of a Kentucky mob that recently burned down a post house erected five miles from town in order to prevent it being used by a prisoner, in gaol, affected with small-pox.

The State Legislature has enacted a law making it mandatory for cities which have a population of over 50,000 inhabitants to establish free public baths.

The recent meeting of the American Medical Association in Baltimore, Ind., was well attended, and the scientific papers were of the usual standard of merit. Dr. R. Beverly Cole, of San Francisco, was elected president, and Atlanta, Ga., was selected for the meeting in 1896.

At the meeting of the New York Academy of Medicine, on May 16th, Dr. Henry Heiman reported the results of a clinical and bacteriological study of the gonococcus in the male urethra and in the vulvo-vaginal tract of children. He concluded that Neisser's gonococcus is never present in the normal urethra; that the diplococci found in the normal urethra can be positively differentiated by the Gram stain; that the diplococcus described by Tarro in connection with his acid culture media experiments is not the gonococcus; that liquid sterilized chest serum is a better culture medium in every way for the gonococcus than the placenta serum used by Wertheim; that urine agar is not an ideal culture medium as Finger claims; that Gram's is the only crucial staining test for the gonococcus; that the normal vulvo-vaginal tract is never a habitat for the gonococcus; that there is reason to believe that there is a specific micro-organism in catarrhal colpitis, which is either the diplococcus described by Bockhart, or that of E. Fraenkel; that in specific colpitis the gonococcus found is identical with that found in specific male urethritis; and, finally, that the speaker's inoculation experiments on the human urethra confirmed the belief in the specific pathogenic power of the gonococcus.

CHICAGO.

"Fake" Hospitals.

A CRUSADE has very wisely been started against the so-called "fake" hospitals which have come into existence of late years. To the end of effectually getting at the evil, the Council has had presented an ordinance, a draft of which is here submitted. Whether or not the restrictions are drawn close enough to affect the illegitimate massage establishment or not must be left to the thought of your readers.

Section 1. That it shall be unlawful for any person, firm, association, or corporation other than the regularly constituted authorities of the State of Illinois, or the county of Cook, or the city of Chicago, to open, conduct, manage, or maintain any hospital as hereinafter defined within the corporate limits of the city of Chicago without first obtaining a permit therefor, to be issued by the Commissioner of Health of the city of Chicago, upon the written application of such person, firm, association, or corporation, which application shall state the location, or proposed location, of such hospital the purposes for which it is to be opened, conducted, or maintained, the accommodations or proposed accommodations for the inmates thereof, the nature and kind of treatment given or proposed to be given therein, and the name and address of the chief surgeon, physician, or intended chief physician or surgeon attendant thereat.

Section 2. It shall be the duty of the said Commissioner of Health, upon the presentation of such application, to make or cause to be made strict inquiry into the facts set out in such application, and if upon such inquiry he shall find that such hospital is or is intended to be constructed so as to afford proper accommodation for the care of the persons received or proposed to be received therein, and that the chief physician or surgeon, or intended chief physician or surgeon attendant thereat, gives or is under agreement to thereafter give such attendance thereat as does or will render him responsible professionally for the medical or surgical treatment given or to be given to any and all persons thereat, and that such chief physician or surgeon is regularly

authorised to act as such under the laws of the State of Illinois, and upon the payment to said Commissioner of Health of a licence, permit, inspection, or examination fee of ... dollars, he shall issue a permit in the name of the City of Chicago to such applicant to open, conduct, manage, or maintain a hospital at the place and in the manner and for the purpose in such application mentioned, which said permit shall cease and be operative the 31st day of December next following the issue thereof.

Section 3. It shall be the duty of such person, firm, association, or corporation permitted as aforesaid to open, conduct, or maintain a hospital within the corporate limits of the city of Chicago to make a report to the said Commissioner of Health on or before the 5th day of each calendar month, showing a complete record of such hospital during the preceding month, including the number of inmates received, discharged, and died during the month, causes of death, and such other information as may be necessary to an intelligent sanitary supervision of the establishment; such record to be furnished on blanks prepared and supplied by the Commissioner of Health, verified by the affidavit or affirmation of the chief physician or surgeon or superintendent attendant thereat.

Section 4. Every hospital permitted as aforesaid shall at all times be open to the inspection of the said Commissioner of Health or his duly appointed assistants or inspectors.

Section 5. The Commissioner of Health of the city of Chicago is hereby authorised and empowered to inspect, or cause inspection to be made, whenever and as often as he may deem proper, of any hospital permitted as aforesaid within the corporate limits of the city of Chicago, and if, upon any such inspection, he shall find the same to be conducted, managed, or maintained in violation of the terms of the application for the permit under which the same was opened, conducted, managed, or maintained, or in violation of any of the health or sanitary ordinances, rules, or regulations of said city of Chicago, then and in that event he is hereby authorised and empowered to revoke any such licence issued for the opening, conduct, management, or maintenance of the same.

Section 6. Any person or persons, or corporation other than the regularly constituted authorities of the State of Illinois, county of Cook, or city of Chicago, opening, conducting, managing, or maintaining a hospital as hereinafter defined within the corporate limits of the city of Chicago without first having obtained a permit therefor as provided in Section 2 of this ordinance, or after a revocation of such permit under the authority conferred in Section 5 of this ordinance, or in violation of any of the provisions of this ordinance, shall be and is hereby declared to be guilty of maintaining a nuisance, and upon conviction thereof shall be fined in a sum not less than ... dollars nor more than ... dollars.

Section 7. For the purposes of this ordinance a hospital is hereby defined to mean any place or establishment used for the reception or care of the sick, injured, or dependent, including women awaiting confinement, or used for the medical or surgical treatment of mental or physical disease or injury.

Section 8. This ordinance shall take effect and be in force from and after its passage and due publication.

CORRESPONDENCE.

THE HEALING OF GUNSHOT WOUNDS.

SIR.—I see in the report of the opening address in the Section of Surgery that Sir William MacCormac made the observation: "Longmore never saw a gunshot wound heal in this way," that is, without suppuration. As this is by no means true in the unrestricted way in which the statement appears, I hardly like it to remain on record without remark. I presume Sir William MacCormac has founded his statement on an observation of mine in the first edition of my book on *Gunshot Injuries*, which was published in the year 1877. At page 71 of that work I stated, with reference to John Hunter's remark that wounds by musket balls with reduced

welocities are often healed by first intention, that "I had never seen a musket shot wound heal by first intention, nor any part of one heal by this process." This statement, and the remarks which follow, as may be seen on consulting the work itself, was entirely restricted to wounds by the spherical musket bullets alluded to by John Hunter, and to the bullets nearly similar in weight and volume, familiar to all army surgeons who were engaged in field practice during the Crimean and Indian Mutiny wars. I confess I am rather surprised that at the final action of the wars of 1870-71 Sir William MacCormac should have often seen wounds by Chassepot bullets, though these projectiles were somewhat less in weight and size, heal without suppuration, for after the war I conversed with many French army surgeons, some of whom had been actively employed in the principal battles of the campaign, and they one and all told me that according to their experience the healing of even the most simple flesh wounds inflicted by either the Prussian needle gun or their own Chassepot bullets without suppuration was an extremely rare occurrence. With the narrow rifle bullets of the present time, improved applications of antiseptic surgery, and better arrangements of field hospitals, all the conditions which then existed are now totally changed.—I am, etc.,

Woolston, Hants, Aug. 8th.

THOS. LONGMORE.

WATERBORNE TYPHOID.

SIR.—I have read with intense interest the able and comprehensive report prepared by Mr. Ernest Hart, D.C.L., for the Parliamentary Bills Committee of the British Medical Association, on the above subject.

The relation of the use of water in a polluted state to the manifestation of typhoid has received universal medical consent in its favour, especially when such water, after careful chemical and bacteriological examination, is found to be specifically contaminated. My apology for presuming to suggest some other probable cause for the spread of the disease must consist in the fact that here in India we witness year by year outbreaks of enteric which are most difficult, if not impossible, to trace to a waterborne cause. To offer a possible solution to this proposition is the object of my letter, and in so doing I would draw attention to the part taken by the common house fly as a carrier and disseminator of the disease. Any person who has visited Egypt or the plains of India during the earlier months of the hot weather can, I think, bear corroborative testimony as to the clouds of flies everywhere met with. Observation soon teaches us as to their disgusting habits and modes of feeding, utter disregard being shown as to whether they swarm in unenviable competition on the stools recently passed by enteric, choleraic, or dysenteric patients, etc., or choose the articles of food and drink of which we are the unhappy partakers. In their rapid movements from one sort of filth or food to another, have we not got strong presumption, if not demonstrative evidence, as to a possible manner in which the morbid material may be conveyed to the alimentary canal? Those of us who have witnessed the marvellous way in which the comma bacilli of cholera can multiply on agar jelly within twelve hours from the minutest inoculation do not wonder why other bacilli (enteric, for instance) cannot act a similar part when carried and deposited by flies, either by their limbs or dejecta, on suitable pabula.

Considering the supposed immunity (?) of the native of India from enteric fever, it is difficult to account for the present prevalence of the disease among the European troops of the Chitral relief force. Marching into a country never before occupied by Europeans, the waterborne theory will scarcely account for it. We must, I think, conclude that the disease was brought with us from India, and is not due to pathogenic origin, especially as the first half dozen cases occurred well within the incubation period, and that from these initial cases as far as this brigade is concerned the specific poison has been conveyed to others, the most likely media being the myriads of flies that everywhere swarm around, and accompany us on the march from one camp to another.

Our water supply has in many instances been above suspicion, being procured from springs coming directly from the mountain side, and yielding no reaction as to oxidisable

organic matter when tested with permanganate of potash solution.

The universal prevalence of enteric fever among Europeans in India has become a question of the vastest hygienic importance, and any means which will diminish the number of cases yearly admitted to our military hospitals must be hailed with satisfaction. With this object in view I would suggest the adoption of small incinerators in all hospitals in which enteric fever patients are treated to ensure the annihilation of excreta, etc., passed by such patients. Under the present system for the removal and disposal of night soil it is to be feared that in many cases the *materies morbi* of the disease finds a too suitable habitat for its propagation and continuance, where, like mushroom spawn sown on a dung-hill, it will yield a heavy crop, and continue to do so, perhaps, for years.—I am, etc.,

J. O. BATTERSBY, M.B., D.P.H., etc.,

Surgeon-Major A.M.S., 2nd Brigade, Chitral Relief Force.

July 9th.

ON OVER-OPERATING IN GYNÆCOLOGY.

SIR,—As many of those who, like myself, listened with pleasure to the address with which Sir William Priestley opened the Section of Obstetric Medicine and Gynecology must have longed to (but of course could not then) discuss the burning questions dealt with in the address, I trust you will kindly find room in the columns of the BRITISH MEDICAL JOURNAL for some remarks thereon.

In the first place let me ask, Is there, as Sir W. Priestley avers, over-operating in gynecology? Is it not rather the fact that the surgery of diseases of the female pelvic organs has participated in the immense advance which has been made in recent years in the surgical treatment of disease in all other parts of the human frame? I feel sure the surgeons and obstetric physicians of this country will repudiate the words of Verneuil (which Sir W. Priestley quotes), in which he describes those who remove the ovaries or resect a slice of the oesophagus or stomach as indulging in a "sanguinary debauch"! Sir W. Priestley states that a demand for less operating comes from across the Atlantic, and it is right that this should be so, as in America lacerations of the cervix (no matter how slight) have so frequently been sown up and the uterine appendages removed for neuroses that discredit has been brought upon these operations; but I altogether refuse to believe that in this country such indiscriminate and unnecessary operating is ever indulged in.

Sir W. Priestley speaks "of the tendency in the present day of the obstetric physician to invade the domain of the surgeon in reference to what may be called external operations" (I presume he means operating on the uterus and its appendages *per ventrem*); and he goes on to say, "The College of Physicians will look askance at the claims for the Fellowship of those of its Members whose chief work is avowedly surgical," that is to say, that an obstetric physician may operate as much as he likes from below—remove fibroids, cure fistulae, extirpate the uterus and ovaries *per vulvum* as hitherto—but once let his knife wander above the mons *veneris*, even though he feels convinced he can save his patient more surely than by operating *per vaginam* he puts himself outside the pale—the Fellowship of his College is not for such as he.

This statement, Sir, is such a serious one that in the interests of many present—and of all future—obstetric physicians it surely calls for some definite ruling on the part of the authorities of the College. Of all the obstetric physicians and assistant obstetric physicians in London and the provinces, there are, I believe, only five who do not perform abdominal section. Of the five, one was a very successful ovariologist until the claims of an extensive midwifery practice caused him to cease doing these operations; two are prevented by the rules of the hospital to which they have become attached from continuing to perform abdominal section, and the remaining two have, I believe, never so operated.

Sir W. Priestley suggests that those obstetric physicians who perform abdominal sections should take the Fellowship of the College of Surgeons; but, as one who possesses this valuable diploma, I would respectfully point out to the President and Council of the College of Physicians that if they

refuse the Fellowship to obstetric physicians who operate on the female pelvic organs *per ventrem* and give it, as has been done for many years, to those who operate *per vaginam*, a grave injustice will be inflicted on many gentlemen who, on becoming obstetric physicians, looked forward to being made Fellows of their College in due course, provided they had done nothing derogatory to the dignity of the profession. By all means, if it is thought desirable, let it be a law that in future obstetric physicians who perform abdominal sections shall not be eligible to become Fellows of the College, but, in common justice, let such law not be retrospective.

Sir W. Priestley asks, "Are our antiseptic methods a sufficient safeguard against the possible contamination of lying-in women by one who undertakes extensive surgical work in addition to obstetric practice?" I answer emphatically, Yes, and a man who has operated on a pyosalpinx or a suppurating ovarian tumour can in a quarter of an hour make it perfectly safe for him to attend a lying-in woman.

Let me ask Sir W. Priestley this question: "Which is more likely to keep himself aseptic—the obstetric physician who performs abdominal section, and who, from the very fact of doing these operations is imbued with the profound importance of keeping himself and all his paraphernalia aseptic—or he who does not so operate, but who may at any moment have to attend a midwifery case soon after examining a patient suffering from a stinking vaginal discharge? The solution of the difficulty as to the obstetric physician operating Sir W. Priestley finds in "appointing a gynaecological surgeon to every hospital who shall work in conjunction with the obstetric physician." If by this he means that every disease of the female peculiar to her sex (caruncles, polypi, vaginal cysts, uterine cancer, etc.) may be diagnosed by the physician, but must be handed over to the surgeon for operation, then I say no obstetric physician of repute will hold office under such conditions, but if he means that the obstetric physician may (as at the Samaritan Hospital) do whatever operation he likes *per vaginam*, but must pass on all cases requiring abdominal section to the surgeon, then I say that in my humble opinion it is a case of "straining at a gnat but swallowing a camel."

For my part I agree with what Dr. Herbert Spencer, of University College Hospital, said in a paper which he read before the Medical Society, that it would be a wise and gracious act on the part of the surgeons in every hospital to hand over to the obstetric physicians all the cases of disease of the female generative organs requiring abdominal section. This has, I believe, been done for some years at King's College Hospital without friction between Professor Playfair and his colleagues.

In conclusion, let me repeat now what I said in the debate on Dr. Spencer's paper, namely, that as the art of obstetrics is in great part surgical, those who practise that art should be called obstetric surgeons, that the qualification for holding such a post at a hospital should be the F.R.C.S. and not the F.R.O.P., and that the existing anomaly was the fault not of the College of Physicians but of the College of Surgeons, which in years gone by refused to shelter under its wing the obstetrician.

Apologising for the length of this letter, I am, etc.,

Harley Street, Aug. 3rd.

WILLIAM DUNCAN.

"PUBLIC HEALTH LEGISLATION AND THE NEEDS OF INDIA."

SIR,—Will you be pleased to accord me permission to make a personal statement with reference to the address on the above subject delivered by Mr. Ernest Hart, D.O.L., at the meeting of the British Medical Association in London last week? Having served thirty-two years in the Army Medical Department, I desire to state that for the past fifteen years I have, both officially and by letters and articles in the public press, etc., advocated the view that enteric fever in India was chiefly a waterborne disease. For the proof I will just quote two paragraphs from a pamphlet I wrote in 1891 for submission to the Government of India, entitled, "The Hygienic Conditions of Indian Cantonments and the Necessity for Sanitary Legislation." One reads thus: "The water supply is generally derived from wells, and it is the burning question, because it is through the water supply that failure in the other hygienic conditions of a cantonment acts injuri-

ously on the general health." The other is as follows: "Granted a pure water supply and it is believed that enteric fever would disappear and cease to be the chief cause of the soldier's mortality in India." I acknowledge that my voice all these years was as that of one crying in the wilderness, but now that Mr. Ernest Hart has given the weight of his great authority to the question, it cannot fail to attract the public attention, and to compel official action.

My advocacy of improved sanitation for cantonments and for regiments in India has been treated with departmental indifference and even worse, but this is not the occasion for this discussion. It has been, therefore, gratifying to find one's views obtain so powerful a support.—I am, etc.,

W. HILL CLIMO, M.D.,

Brigade Surgeon-Lieutenant-Colonel, A.M.S. (retired).
Westfield, Aldeburgh, Aug. 3rd.

MALARIAL PARASITES IN THE BLOOD.

SIR,—An extraordinary statement, dated Haidarabad (Deccan), August 4th, from a correspondent, appears in to-day's issue of the *Times*, to the effect that Dr. Lawrie—I presume Surgeon-Colonel Lawrie—"reports as the result of an inquiry, in which he was assisted by Dr. Martyn Jordan, that there is no parasite in the blood in malaria. Through a readily-demonstrable staining error the nuclei of the white cells in the blood have been mistaken by the Italian and other investigators for parasites connected with the red blood corpuscle." I do not for a moment think that such a statement emanated from Surgeon-Colonel Lawrie, who must know very well that the malaria parasite has nothing to do with the white corpuscles; that it is for the most part located in the red blood corpuscles, and is readily seen in them without staining process of any description whatever—in fact, far more readily seen in them in fresh blood than in dried and stained preparations. If Laveran's body is not a parasite then it is most wonderfully contrived device in Nature for deceiving the pathologist. The malaria parasite has had a hard struggle to get recognised. Want of opportunity, want of knowledge of a very simple, but very necessary technique, inaccurate and careless observation have all conspired to keep it in the background. But it is a fact all the same; and I do not know of any competent pathologist who, having once seen it, has refused to recognise its parasitic and specific nature. I trust such statements as this which appears under Dr. Lawrie's name will not be accepted or be allowed to interfere with the gradual growth and ultimate general adoption of the new pathology of malaria for which the world stands so much indebted to M. Laveran.—I am, etc.,

Queen Anne Street, W., Aug. 6th.

PATRICK MANSON.

THE WEST SOMERSET BRANCH OF THE BRITISH MEDICAL ASSOCIATION.

SIR,—In the *BRITISH MEDICAL JOURNAL*, at page 332, I observe that Dr. Mackenzie is reported to have said, in speaking to Dr. Welsford's resolution, that he represented Devon and Somerset, and that only one-third of the practitioners in Devon and Somerset were members of the Association for a reason which he gave. Allow me to say that Dr. Mackenzie does not represent the West Somerset Branch, and as regards the number of practitioners who are members of the Association I think it can be shown that in this district the proportion is much larger than he is represented to have stated.—I am, etc.,

Taunton, Aug. 5th.

W. M. KELLY,

Honorary Secretary, West Somerset Branch.

FEES TO MEDICAL WITNESS.

SIR,—Medical men have the matter entirely in their own hands if they absolutely decline to attend a police-court unless served with a proper subpoena. On one occasion only did I attend at the local police-court here, on being warned by the police-sergeant to do so, to give evidence in a case of attempted suicide. I was at the court for three-quarters of an hour, when the prisoner was discharged with a lecture. I demanded my fee from the clerk, who very coolly informed me that the magistrates had no power to pay me, as I had not given evidence. The clerk further told me to apply to the prisoner's relatives for my fee. This I declined to do, and insisted upon the police obtaining the fee for me, in which

course I was successful. I then informed the magistrate that I should absolutely decline to attend on any further occasion unless subpoenaed.

I have had no difficulty since, although several times I have first been "asked" by the police to attend. This I have always declined to do unless served with a subpoena.—I am, etc.,

Northfleet, Kent, July 20th.

HUBERT T. SMITH.

P.S.—I much question whether Mr. Scott was served with a subpoena, otherwise he could have recovered his fee.

NAVAL AND MILITARY MEDICAL SERVICES.

ARMY MEDICAL STAFF EXCHANGE.

The charge for inserting notices respecting exchanges in the Army Medical Department is 5s. 6d., which should be forwarded in stamps or post office order with the notice. The last post on Wednesday is the latest by which these announcements can be received.

A SURGEON-LIEUTENANT-COLONEL, expecting to be ordered abroad late this trooping season, wants to exchange with an officer lately home, or would exchange to a Mediterranean station or colony for part expired tour. Address, Maxman, office of British Medical Journal.

A medical officer of field rank going abroad this trooping season wants to exchange with an officer who will have two or three years yet to remain at home. Liberal terms will be given. Address Surgeon, care of Messrs. Holt and Co., 17, Whitehall Place, London.

THE NAVY.

The following appointments have been made at the Admiralty: JOHN K. CONWAY, M.D., Fleet-Surgeon to the Royal Marine Depot, Walmer, August 2nd; JOHN E. FANN, Staff Surgeon to the *Palawan*, August 2nd; HENRY B. MARSH, Staff-Surgeon to the *Cornwall*, for Gibraltar Hospital, August 2nd; JAMES G. DOW, M.B., to the *Northampton*, August 2nd. Surgeon H. E. K. EARLE has been placed on the retired list of his rank, June 7th. He was appointed Surgeon, August 20th, 1895.

ARMY MEDICAL STAFF.

SURGEON-MAJOR-GENERAL JOHN BY COLE RAEDE, C.B., retired pay, is appointed Honorary Surgeon to the Queen, vice Deputy-Surgeon-General J. A. BOSTOCK, C.B., half-pay, deceased, July 21st. Surgeon-Major-General RAEDE entered the service March 24th, 1864, and became Surgeon-Major-General from February 15th, 1888, retiring in April, 1893. He was with the 2nd Battalion Rifle Brigade throughout the Eastern Campaign in 1854-5, and was at the battles of Alma and Inkermann, and at the siege of Sebastopol. He was wounded on November 14th, 1854, at the explosion of the French siege train (medal with three clasps and Turkish medal). He was also with the battalion during the whole of its service in suppression of the Indian Mutiny, including the action at Cawnpore, the capture of Lucknow, and numerous affairs during the Oude campaign (medal with clasp). He was likewise in the Afghan war in 1878-9, with the Candahar Column under Sir Donald Stewart (mentioned in despatches, medal).

Some of our contemporaries recently announced the death of Surgeon-Colonel C. MACDONALD, C.B., Principal Medical Officer at Alnashad. We are glad to be able to state that this is incorrect, and that, at his departure of the latest mail received, Surgeon-Colonel Cuffie was at Peshawar and in excellent health.

Surgeon-Major Lieutenant-Colonel J. H. MCGURR, M.D., has been appointed Principal Medical Officer at Cawnpore.

The undermentioned Surgeon-Lieutenants, having completed three years full pay service, are promoted to be Surgeon-Captains, July 24th: HARRY A. HARRIS, JAMES G. MCNATHAN, M.D., HENRY A. HAY, THOMAS M. JENNINGS, M.D., EDWARD W. SLAYTER, M.B., HUGH S. THURSTON, LANCELOT F. MOSE, M.B., CHARLES O. HODGINS, ARTHUR F. TYRRELL, THOMAS B. P. JONES, M.B., GEORGE S. MALDEN, M.B., WILLIAM J. SMYTH, M.D., WILLIAM R. EMMERSON, M.B., ARTHUR G. THOMPSON, M.B., ALEXANDER G. CHAMBERS, GEORGE A. MOORE, M.B., RICHARD C. LEWIS, REGINALD F. E. KENT, HENRY W. H. O'REILLY, M.B., B. THOMAS MARDEN, EDGAR H. CHISHOLM, M.B., GRAHAM H. MARSHALL, M.B., FREDERICK G. FAICHHIE, HAROLD W. K. REED.

Surgeon-Major ROBERT LEWINS, M.D., died at Nottingham Place, London, on July 2nd. He entered the service as Assistant-Surgeon, December 18th, 1861; became Surgeon, March 3rd, 1864; Surgeon-Major, January 21st, 1888, and retired April 25th, 1893. He served with the 2nd Regiment in the Eastern Campaign of 1854, and up to January 1861, 1862, including the battles of Alma, Sebastopol, and Inkermann, and signed the declaration, receiving the medal with four clasps and Turkish medal. He was also in the expedition to the north of China in 1860 in charge of the hospital ship *Marionette*, and was present at the capture of the Taku Forts, receiving the medal.

ARMY MEDICAL RESERVE.

Surgeon-Lieutenant JOHN C. WHEAT, having resigned his Volunteer medical appointment, comes to be an officer of the Army Medical Reserve, July 21st.

INDIAN MEDICAL SERVICE.

The undermentioned Surgeon-Lieutenants, having served three years in that rank, become Surgeon-Captains from July 21st:—BENJAMIN P. B. HAIN, M.B., T. W. A. FORTY, M.B., R. B. MARSH, M.B., E. V. WHEAT, M.B., H. G. MURVILL, M.B., A. O. HUBBARD, C. G. RUSSELL SCOTT, M.B., H. A.

SMITH, M.B.; D. R. GREEN, M.B.; G. M. G. SMITH, M.B.; H. M. EARLE, J. G. HUBBERT, M.B. MEDICAL OFFICERS: J. L. MACRAE, M.B. SURGEON F. Y. SWINTON, S. H. BARNETT, M.B.; THOMAS JACKSON, M.B.

The Secretary of State for India has decided that medical and veterinary officers, whether they belong to the Military, Medical, and Veterinary services, or are civil practitioners, who have served eighteen years on the staff of volunteer corps, and rendered substantial services, are eligible for the Volunteer Corps' pension.

The following rules have been laid down for the grant of pay to a Surgeon-Lieutenant-Colonel of the Indian Medical Service during the period he is attached to the staff of a principal medical officer for the purpose of acquiring a knowledge of military medical administration:—

(1) In cases where it is practical to attach the officer to the staff of a principal medical officer without his relinquishing his civil duties, his full civil pay will be continued to him; (2) in cases where the officer has been obliged to relinquish his civil duties, he will be allowed the grade pay of his rank, together with half the difference between that grade pay and the substantive pay of his civil appointment, the whole to be charged against the military estimate.

Surgeon-Lieutenant Colonel J. A. LAING, M.B., Madras Establishment, has been permitted to retire from the service from September 21st. He was appointed Assistant Surgeon, April 1st, 1870, and became Surgeon-Lieutenant-Colonel twenty years thereafter.

An extra pension of £200 per annum, due to the Bombay Establishment for 1895-6, is to be allotted to Surgeon-Lieutenant Colonel C. W. MACHURY, which is announced to take place from March 21st, 1896.

THE VOLUNTEERS.

MR. GEORGE ARTHUR TAILOR is appointed Surgeon-Lieutenant to the 1st Volunteer Battalion the King's Shropshire Light Infantry, August 3rd.

Surgeon-Captain H. COLCATH, M.D., 2nd Sussex Artillery, is promoted to be Surgeon-Major, August 7th.

The undermentioned gentlemen are appointed Surgeon-Lieutenants in the corps specified, dated August 7th: ALEXANDER BUTLER, M.D., 1st Kent and Durham Artillery; ALFRED DUKE, M.B., the Tynemouth Artillery (western division Royal Artillery); EDMOND WILLIAM ST. VINCENT EYAN, 16th Middlesex Rifle (London Rifle).

Surgeon-Lieutenant D. STEWART, 1st Volunteer Battalion the Northumberland Fusiliers, is promoted to be Surgeon-Captain, August 7th.

Surgeon-Major C. C. GILHO, 2nd Volunteer Battalion the Gordon Highlanders, is promoted to be Surgeon-Lieutenant-Colonel, August 7th.

Surgeon-Lieutenant P. M. YARLEY, 16th Middlesex Rifle (London Rifle), is now appointed Second Lieutenant in the same corps, August 7th.

ARMY MEDICAL SCHOOL.

The half-yearly session of the Army Medical School, Royal Victoria Hospital, Netley, was brought to a close on July 21st, when, in the presence of a large gathering of the medical officers and others, Surgeon-General Sir Joseph Fayrer, K.C.S.I., distributed the prizes, and the results of the recent examinations were announced. The principal medical officer of the hospital, Surgeon-Major-General GRAND, presided. The following are the lists of surgeons on probation of the Medical Staff of the British Army and of the Indian Medical Service who were successful at both the London and Netley examinations, with their combined marks. The prizes are awarded for marks gained in the special subjects taught in the Army Medical School, and the final position of the gentlemen are determined by the marks gained in London, added to those gained at Netley:—British Medical Service: I. F. ARTHUR, 2,141 marks; R. J. BLACKHAM, 1,951; S. H. FAIRFAX, 4,411; G. T. M. MAURICE, 4,431; R. FAWCETT, 4,117; J. V. FARRER, 3,341; H. W. GRANT, 3,371; P. E. GUNTER, 3,341; J. H. CAMPBELL, 4,411; J. GREECH, 3,441; M. J. F. SMITH also gained the second Montagu prize, and the Chevreul prize in Hygiene. Indian Medical Service: J. STEPHENSON, 3,531; G. S. WINDAR, 3,111; W. B. TURNBULL, 5,031; E. E. WATERS, 4,411; A. TREVES, 4,411; J. E. CAMPBELL, 4,411; A. HOUSTON, 4,411; A. E. W. KING, 4,411; R. J. MORGAN, 4,411; A. A. COBBE, 4,411; F. I. BISHOP, 3,371; M. G. 3,371; H. E. F. K. RAY, 3,371; E. M. HILLING, 3,371; E. S. WATSON, 3,371; E. G. WEBSTER, 3,371. Mr. J. Stephenson also gained the Herbert prize of £50, the Forbes Memorial Medal, the Martin Memorial Medal, and the prize in pathology. Mr. W. B. Turnbull secured the first Montagu prize of £100, and the bronze medal, whilst Mr. E. E. Waters was awarded the Madson prize for clinical and ward work. Sir Joseph Fayrer, in his address, congratulated the surgeons on their success, and addressed some other words of advice to those just starting on their career in the British Army and Indian Medical Services.

PAY OF F.M.O.'S IN INDIA.

DISSENTED writes that under the new Indian Army Estimate the pay of Surgeon-Major-Generals of army corps has been fixed at 2,000 rupees per month, and contrasts this sum with the pay of Major-Generals commanding divisions, Colonels on the staff commanding brigades, and senior Lieutenant-Colonels commanding stations, all of whom are better paid.

"We hear from other sources that the pay of F.M.O.'s of the new army corps is to be 2,200 rupees a month, not 2,000 rupees. The difference, although a tangible one, does not, we think, bring the pay up to what it ought to be, considering the responsibilities of the position and the relative scale of pay of the commandant ranks; and in so far as any correspondent is justified in his structure."

THE HEALTH OF EDINBURGH.—The death rate of Edinburgh was 15 per 1,000, as against 13 per 1,000 in the previous week. Sixty cases of scarlet fever were notified during the past week, without death; as against 65 cases and 2 deaths in the preceding week.

OBITUARY.

SIR JOHN TOMES, F.R.C.S., F.R.S.,

Consulting Surgeon-Dentist to the Middlesex Hospital; late Surgeon-Dentist to the Dental Hospital, London.

It is with much regret that we record the death, at his house in Caterham Valley, of Sir John Tomes, who may justly be called the father of the dental profession in this country.

John Tomes, who came of an old yeoman family, was born at Weston-on-Avon in 1815. He was apprenticed as a surgical pupil to an old-fashioned, hard-riding, hard-working general practitioner at Evesham, with whom he remained until he entered at King's College in 1836, the same year as Sir Wm. Bowman. He afterwards became house surgeon to the Middlesex Hospital, a post which he retained for two years. While holding this office he invented the tooth forceps, with jaws accurately adapted to the form of the necks of the various teeth, which were the first exemplars of the modern type of forceps. This early interest in dentistry, reinforced by the advice of the late Sir Thomas Watson and the late Mr. Arnott, who thought that there was a great opening for a man of higher attainments than had generally practised dental surgery, led him to devote himself to that branch.

His reputation as an authority was at once established by the publication of a course of lectures, delivered in 1845 at the Middlesex Hospital on dental physiology and surgery. These lectures were the first scientific treatment of the subjects, and placed him at once in the first rank; yet we read in his diary: "I am resolved not to deliver any more lectures unless I have a class of at least six." In 1840, whilst still house-surgeon at the Middlesex Hospital, he was feeding a nest of young sparrows and a sucking-pig on madder; such of these bones as he did not rub down still exist.

In 1846 Dr. Morton, a dentist of Boston, Mass., had introduced ether; in 1847 Sir John was using it at the Middlesex Hospital for tooth extraction with varying success, sometimes using a mixture of sulphuric and chloric ethers. On January 14th, 1847, he writes in his diary: "Gave ether to Arnott's case of lithotomy eight minutes and insensibility came; the operation then commenced and lasted twelve minutes." And, after notes of other administrations, February 23rd, 1847: "Gave ether to eight patients for operations with great success; Earl Cadogan (a governor of the hospital) and many others present."

Between 1840 and 1856 he contributed an important series of papers to the *Philosophical Transactions* of the Royal Society on dental tissues. He wrote, in conjunction with the late Mr. Campbell de Morgan a paper on the structure of bone, which has become classical, and communicated also to the Royal Society the paper which established the existence of the soft fibrils in denture, which have since been known by his name. In 1859 he published his *System of Dental Surgery*, which has gone through many editions and still holds its own as an admirable textbook. He received the gold medal of the Society of Arts for a machine for reproducing exactly the irregularities of a surface, intended primarily for carving bone for artificial teeth, but applicable to other purposes.

He early took a deep interest in the status of the dental profession, and was one of those who first in 1843, and again in 1855, approached the Royal College of Surgeons on this subject, though without success at that time. He, however, never allowed his interest in the subject to decline and was finally the chief actor in this successful attempt to induce the Royal College of Surgeons of England to grant (in 1858) a Licence in Dental Surgery. His intimacy with Mr. Arnott, at one time President of the College, contributed to bring about this result. He was one of the chief founders of the Odontological Society. He was also one of the founders of the Dental Hospital and the first to give systematic clinical demonstrations there.

After the Dental Licentiatehip had been established for some 20 years it furnished a large body of qualified dentists, and the various schemes for obtaining parliamentary recognition were mooted and many suggestions made. Sir John Tomes threw his great influence into the movement, working with Mr. J. S. Turner as his chief lieutenant, and having secured the good offices of Sir John Lubbock the Dentists

Bill was introduced in 1878, and became an Act in the same session of Parliament. The services of Mr. Tomes to science, and to the dental profession were recognised by his election as a Fellow of the Royal Society, and as a Fellow also of the Royal College of Surgeons, the latter honour falling to him at the same time as it did to the late Professor Huxley. In 1886 he received the honour of knighthood.

For many years, and down to the time of his retirement in 1876 he enjoyed a large practice. The secret of his long record of successful work was his untiring energy, the practical cast of his mind which distinguished the essential from the accidental, and the practicable from the inexpedient. He was absolutely disinterested so that he was respected by his most ardent opponents, and was moreover a very keen and accurate judge of character. He took a great interest in art, and was a good judge of art work. From his earliest boyhood he was a keen sportsman and noted as an excellent shot.

Till within a few weeks of his death he retained all his faculties undimmed, and retained also his interest in science as is shown by the fact

that within the last few months he was working out some points not hitherto described in the structure of the teeth of the horse. For six months however, his strength had gradually been failing and on July 29th he passed quietly away.

Dr. Sibley writes: It may be said of Sir John Tomes that his life was a truly consistent one, and everyone who knew him alike respected and admired the man. His views were of the broadest and most charitable. It would be difficult to imagine a more ideal home than Upwood Gorse, presided over by Sir John's keen and in many respects unique intellect and Lady Tomes's courteous manner, combined with great musical talents, most fully appreciated by her husband. His was indeed a most appropriate crest and motto: "Nil sine Labore," and may be truly said to have been the keynote of his long and useful life.

On Sunday last, August 4th, one of the oldest members of the Royal College of Surgeons, Mr. C. H. GARNLEY, died at

Kilburn from an attack of paralysis on the preceding night. Mr. Greenly was admitted to Membership in 1827. He left Bristol, where he had practised for over half a century, about ten years ago, and migrated to London, where, however, he visited a few patients till he was about 85. Mr. Greenly's mode of life was simple and regular. He was an abstainer for nearly sixty years, and till a few years ago was in the habit of rising every morning at five o'clock to read Greek and Hebrew. His charities were numerous, and his death will be deeply lamented. He has left one son, Mr. Edward Greenly, F.G.S.

UNIVERSITIES AND COLLEGES.

UNIVERSITY OF EDINBURGH.

SECOND PROFESSIONAL EXAMINATION IN MEDICINE UNDER THE OLD REGULATIONS.

Pass List.—H. Dewar, M. A. Ghany, A. Hosking, G. Liddell, B.A.; G. H. List, M. Nuttall, G. Sander, A. E. Scott, Alexandra Mary Campbell Geddes, W. H. Brandon, B.Sc.; G. L. Chisno, E. H. Irwin, K. Selby, R. S. Young, N. H. Ross, W. A. Skinner, G. W. Payne, J. R. Atkinson, B. M. Bone, J. H. Dorman, J. Graham, S. J. Grinsell, M. Jackson, E. H. Jones, W. M. Milne, M.A.; J. Muir, T. H. Stevenson, G. C. Thomas, R. H. Walter, J. G. Bailey, G. S. Brown, J. Stevenson, I. J. Van der Merwe, W. W. Wood, T. Johnstone, T. V. Lockhart-Mure, J. Nicoll, A. J. Orchard, G. W. Reid, W. M. Williams, R. Beattie, M.A.; L. M. Cairns, R. Craven, T. W. A. Daman, B.A.; J. Prentice, M.A.; D. G. M. Teague, J. E. Bennett, A. W. Bowie, S. O. Browne, C. A. Bruggan, C. C. Lall, A. G. Carment, J. D. Doherty, J. C. Hastings, C. H. Kruger, David MacAskie, A. L. Owen, J. F. Wilson, W. A. Young, and G. C. Forrester.

Anatomy and Physiology.—H. L. Apthorpe, A. M. Little, F. W. Price, G. F. Waterston.

SECOND PROFESSIONAL EXAMINATION IN MEDICINE UNDER THE NEW ORDINANCE.

Anatomy, Physiology, and Materia Medica and Therapeutics.—T. J. T. M'Intyre, E. F. M. Neave, C. P. B. Wall, A. G. Worrall, J. Donaldson, H. F. Roland, E. P. Baumann (with distinction), R. B. Black, R. C. Cunningham, L. W. Davies, G. Gatenby, G. W. Miller, J. D. S. Mullin, C. M. Robertson, J. D. Slight, M. A. (with distinction), W. R. Somerset, W. M. A. Smith, J. W. Struthers, W. M. Wilson, V. G. Alexander, L. Boyer, D. Clow, J. Forrest, G. L. Finlay, R. Hill, G. E. Hollings, A. B. MacCarthy, W. Martin, and G. A. Vincent.

FIRST PROFESSIONAL EXAMINATION UNDER THE NEW REGULATIONS.

Chemistry.—C. S. Clark, J. W. Falconer, H. Falconer, S. E. Goggin, G. D. Hamilton, W. J. Jones, P. A. Leighton, E. W. Martin, A. C. Murray, J. Orr, W. M'Kay, H. L. Orr, G. C. Ghose, M. King, G. A. Davidson, E. Loch, S. Malin, R. M. Mitchell, D. K. Nariman, S. C. Pritchard, P. J. Rodington, A. C. Brown, F. J. Hathaway, R. Inrie, W. Park, D. Fenton, W. T. James, C. G. S. Leeds, L. W. Macpherson, A. C. Neeshing, E. J. Pell, S. Southall, H. Stracey, J. B. Thorburn, A. White, W. G. Williams, A. Cartner, G. C. V. K. Davidson, J. Jeffrey, H. E. Gibbs, H. A. H. Gilmer, A. N. de Gruchy, S. H. Morris, A. W. Nankervis, T. E. Richards, E. M'K. Young, V. G. S. Adams, Mary Booth, Agnes J. S. S. Coghlin, Dorothy Gilliland, Edith Hudson, Elsie M. Inglis, Bessie G. Macdonald, Mary R. M'Dougall, Beatrice A. M'Gregor, Jessie M. MacGregor, Marion B. Marshall, Mary J. Menzies, Mary F. Nannett, Annesa Sayba, Ethel L. Starnier.

Botany.—T. H. W. Alexander, Tina M. Alexander, Eliza M. Anderson, J. D. Anderson, J. Anderson, J. Anderson, B. H. R. Aylward, A. J. Baird, H. Baird, J. A. Balck, C. Balfour-Paul, S. A. Ballantyne, W. J. Barclay, M. C. Beatty, H. Bell, J. M. Benson, Harriet A. S. Bird, J. A. Black, Mary Booth, L. P. Bracey, G. Brogden, W. J. D. Bromley, A. Brown, J. M. L. Brown, W. Brown, L. Bruce, E. H. Brunt, A. Brydon, J. Bulst, E. Cameron, Isabella D. Cameron, P. C. Camparolo, M. Campbell, J. B. Cassels, K. Chapel, C. Chilton, W. Clegg-Newton, W. J. Collinson, Jane A. Craig, G. C. Cumming, G. A. Davidson, H. S. Dodds, S. E. Ellis, D. E. Evans, E. Ewart, E. Faxon, D. Fenton, D. J. Fergusson, R. Fernandez-Jardim, D. C. L. Fitzwilliams, A. B. Elliott, S. S. Frank, Y. Fukuda, J. Fullarton, P. Gouteaux, A. B. George, H. E. Gibbs, J. C. Gilchrist, Dorothy, Gilliland, H. A. H. Gilmer, W. Girdwood, B. K. Goldsmith, T. Graham, T. G. Stewart, J. L. Green, G. Grey, A. N. de Gruchy, R. Hamilton, F. W. Hampton, G. H. Hanna, A. C. Heath, A. E. Henton, I. K. Hermon, C. H. Watson, A. M. Holmes, R. D. Hudson, Alice M. Hutchison, W. Hutchison, Elsie M. Inglis, J. G. Jack, F. F. C. Jagger, J. Jamieson, P. J. Jude, J. W. Kerr, T. C. Lauder, I. Laurie, E. G. Leach, C. G. S. Leeds, J. Leggate, L. R. Leasing, E. Loch, J. L. Louis, G. Lowther, C. B. M'Donagh, Bessie G. Macdonald, W. C. Macdonald, Mary R. M'Dougall, W. M'Farlane, Beatrice A. M'Gregor, Jessie M. MacGregor, Robina M'Gregor, A. F. Mackay, W. M'Kay, H. M. MacKenzie, T. C. Mackenzie, T. A. Mackenzie, G. Mackie, H. J. M'Lean, G. MacLennan, R. A. M. Macleod, E. Marshall, J. M. A. MacMillan, J. Macpherson, L. Macpherson, G. P. Maitland, S. Malan, Marion B. Marshall, A. Martin, A. A. Martin, Ruth Massey, Christina A. Mayne, E. J. McIlhenny, K. D. McIlhenny, D. R. Merry, H. A. D. Moore, R. H. Morris, Janet A. M. Mount, A. M. Murray, A. W. Nankervis, Mary F. Nannett, D. K. Nariman, H. C. Nison, T. H. A. Orr, A. S. M. Peabie, K. F. Pell, Faith Philpot-Crowther, A. Preston, K. N. Pringle, J. E. Richards, P. C. Rayner, W. Reid, J. L. Rendall, G. L. Rhye, T. E. Richards, R. A. Ross, G. C. Rowley, Annesa Sayba, F. D. Simpson, H. O. Smith, V. E. Sorapure, S. Southall, G. E. Southon, H. B. Spratt, E. Sproutie, Ethel L. Starnier, B. Stracey, L. Ten Koks, W. G. Thompson, R. G. Thomson, J. B.

Thorburn, J. Thornhill, R. B. Turnbull, G. E. Turner, E. H. H. Udmann, C. Varian, N. N. Wade, D. L. Wall, W. Wallace, E. Weatherston, A. T. White, A. Whyte, W. G. Williams, W. R. E. Williams, A. J. Williamson, A. W. Wilson, Ruth M. Wilson, T. J. G. Wilson, J. Wood, E. M. Young, F. Young.

Zoology.—J. D. Anderson, J. J. Anthony-Jones, A. J. Baird, J. A. Balck, S. A. Ballantyne, G. M. Beatty, P. E. Belandier, J. A. Black, W. J. D. Bromley, A. Brown, D. M. Burden, M. Campbell, G. J. R. Carruthers, W. J. Collinson, H. C. Comber, A. D. S. Cooke, J. Cullen, G. A. Davidson, E. Ewart, D. J. Fergusson, V. G. Fergusson, D. C. L. Fitzwilliams, C. Fraser, G. C. H. Goss, H. E. Goss, J. C. Gilchrist, H. A. H. Gilmer, W. Girdwood, T. Graham, J. L. Green, A. N. de Gruchy, H. Harris, A. C. Heath, I. A. Holcroft, J. G. Jack, J. Jamieson, J. Jeffrey, S. H. Johnson, I. Laurie, J. Leggate, I. R. Leasing, E. Loch, C. B. M'Donagh, W. M'Farlane, D. W. M'Farlane, P. A. MacLagan, H. J. M'Lean, A. G. M'Lean, J. M. A. MacLennan, S. Malin, A. Mann, A. Martin, M. M. McIlhenny, E. T. McIlhenny, E. Menzies, D. B. Merry, R. M. Mitchell, M. C. Morgan, S. H. Morris, A. W. Nankervis, B. K. Nariman, A. D. Nimmo, J. H. C. Orr, T. S. A. Orr, W. Paterson, A. Preston, S. C. Pritchard, W. Purves, G. L. Rhye, J. Richardson, W. Ross, G. E. Smith, C. Spencer, F. T. Thompson, J. A. Thompson, T. J. G. Wilson, J. Wood, E. M. Young, F. Young, Violet G. S. Adams, Tina M. Alexander, Eliza M. Anderson, Harriet A. S. Bird, Mary Booth, Isabella D. Cameron, Agnes J. S. Coghlin, Jane A. Craig, Jane E. Cullen, Dorothy Gilliland, Edith Hudson, Elsie M. Inglis, Mary R. M'Dougall, Beatrice A. M'Gregor, Jessie M. MacGregor, Robina M'Gregor, Marion B. Marshall, Ruth Massey, Christina A. Mayne, Mary J. Menzies, Janet A. M. Mount, Faith Philpot-Crowther, Winifred J. Pirrie, Annesa Sayba, Ethel L. Starnier, Esther M. Stuart, M. Ruth Wilson.

Physic.—G. Lowther, E. J. Pell, A. Whyte, J. Bulst, P. C. Camparolo, J. B. Cassels, K. Chapel, H. B. Dodds, R. Faxon, Y. Fukuda, J. Fullarton, P. Gouteaux, B. K. Goldsmith, T. G. Stewart, R. Hamilton, G. H. Hanna, A. E. Henton, I. K. Hermon, A. M. Holmes, R. D. Hudson, E. F. Jardine, J. W. Kerr, E. Liddell, J. L. Louis, W. C. Macdonald, T. C. Mackenzie, T. A. Mackenzie, G. Mackie, G. MacLennan, A. A. Martin, H. A. D. Moore, W. A. Murray, A. S. M. Peabie, K. N. Pringle, P. C. Rayner, R. A. Ross, G. O. Rowley, F. D. Simpson, V. E. Sorapure, C. E. Southon, E. Sproutie, K. L. Tegg, R. G. Thomson, R. B. Turnbull, G. E. Turner, N. N. Wade, D. L. Wall, W. Wallace, W. R. E. Williams, J. M. Benson, A. F. Mackay, H. M. Mackenzie, L. D. H. Raugh, J. S. Bostock, E. N. Brebner, H. E. Coghlin, A. Dods, J. Inglis, Florist Myers, T. R. Robertson, J. Small, H. E. Wareham, Dorothy Gilliland, D. R. Evans, H. E. Gibbs, H. A. H. Gilmer, A. N. de Gruchy, W. E. Herbert, K. T. McIlhenny, S. N. Morris, E. M'K. Young, G. V. K. Davidson, H. Dedgson, J. Jeffrey, W. M'Farlane, C. B. Smith, V. G. Fergusson, W. Paterson, P. J. Rodington, A. G. Bryden, A. C. Brown, A. W. Fuller, Frank S. Hathaway, W. Park, F. G. Ralston, W. Girdwood, P. A. MacLagan, E. Menzies, D. B. Merry, W. Sloss, W. J. D. Bromley, T. H. W. Alexander, J. Anderson, J. Anderson, B. S. H. Aylward, H. Baird, W. J. Barclay, L. Bruce, A. Brydon, D. Fenton, W. T. James, C. G. S. Leeds.

UNIVERSITY OF ABERDEEN.

The following candidates have received the Degrees in Medicine and Surgery:

Degree of M.D.—G. A. Craig, M.B., C.M.; J. Leys, M.A., M.B., C.M.; W. L. MacKenzie, M.A., M.B., C.M.; J. F. Morrison, M.B., C.M.; W. Scatfield, M.A., M.B., C.M.; R. Soutar, M.B., C.M.; R. R. Suttie, M.B., C.M.

The thesis of W. L. MacKenzie was considered worthy of "highest honours."

Degrees of M.B. and C.M.—L. Adam, P. H. Bannister, F. Beelham, G. A. Bruce, G. Cameron, A. G. Campbell, W. Christie, G. Cowie, W. Cowie, M.A., W. P. Crombie, D. H. Danks, J. L. Dickie, H. Duns, M.A., E. K. Gawn, J. A. Gibb, J. M'ulloch, A. H. Mackie, M.A., J. MacLennan, M.A., A. Milligan, M.A., A. G. Milne, G. A. Reid, C. Ritchie, T. M'K. Ross, A. Thomson, J. W. Thomson, M.A.

J. W. Milne has passed the Examination for the Degrees of M.B. and C.M., but will not graduate until he has attained the necessary age. The John Murray Medal and Scholarship (to the most distinguished graduate of the year) has been awarded to A. H. Lister, B.A., M.B., C.M.

The George Thompson Fellowship has been awarded to W. G. Grant, M.B., C.M.

The following candidates have passed the First Portion of the First Professional Examination:

Old Regulations.—J. E. de Silva.
New Regulations.—E. Bisset, W. J. Bruce, J. Catto, R. D. Clark, W. F. Croil, A. R. Davidson, H. A. Davidson, G. G. Farquhar, K. Fraser, J. A. S. Grant, E. G. King, G. V. M. E. Le Fanu, J. Low, D. M. Macdonald, Miss Myra MacKenzie, B. McKilliam, J. McPherson, G. Moir, C. G. R. Munnik, A. M. Rose, F. Sellar, J. A. Simpson, H. T. Skae, G. L. Smith, H. E. Smith, J. A. Stephen, A. W. M. Sutherland, H. B. Tawse, J. Taylor, J. A. Tolmie, J. A. Watt, A. Westerman, J. Wilson, T. H. Worgan.

The following have completed the First Professional Examination:
Old Regulations.—G. Chalmers, L. Costeril, D. A. R. Farquharson, J. Haddell, A. R. Laing, H. P. Mitchell, H. L. Phelps, J. A. Ross, W. M. Smith, E. W. Wood-Mason.

New Regulations.—C. A. Bentley, J. G. Bruce, R. Carnegie, H. R. Colman, R. Craun, J. M. Duncan, J. W. Duncan, G. A. Fairman, J. A. Haig, P. A. Innes, J. W. Lindsay, D. M. Maciver, F. MacLennan, J. J. R. MacLeod, C. A. Mavor, A. M. Mitchell, J. B. Mitchell, E. H. Nash, W. D. Ritchie, R. H. Robson, A. E. Simpson, C. L. F. Stephen, W. Teach, D. D. Whyte.

The first portion of the Second Professional Examination (*New Regulations*) has been passed by J. A. Thomson.

The following have completed the Second Professional Examination:
Old Regulations.—J. H. Abrahams, F. J. Alexander, R. J. Brown, W. J. Byres, G. Chalmers, J. G. Chalmers, M. Connon, H. Forbes, P. J.

the case above set forth; and that Mr. X. should rightly be regarded as the patient of Dr. A. as the affirmatively implied family medical adviser, and not of Dr. B., who should have retired from the case in accordance with the rule in question, and to which we would refer him (Dr. B.) in confirmation of our views.

TITLES OF "PHYSICIAN AND SURGEON."

H. H. L. P.—In reply to our correspondent's question: Has the holder of the diploma of the Society of Apothecaries a legal right to have engraved on his brass plate under his name the titles of "Physician and Surgeon"? We may say that there can be no objection to a Licentiate of the Society of Apothecaries whose diploma is dated on or after July 1st, last, styling himself "Surgeon," but with regard to the title "Physician" the case may be different. We mean that having regard to the not remote decision of the High Court, to which we have before referred, it would appear that Fellows or Members of a College of Physicians alone are entitled to call themselves "Physician." It is, however, doubtless the fact that many general practitioners possessing a qualification enabling them to practice medicine and surgery pass "Physician and Surgeon" after their names on doorplate and card. It would be extremely desirable in the interests of the profession if the General Medical Council issued some definitive rules dealing with the vexed question of medical titles generally.

PRINCIPAL AND ASSISTANT.

FEMUR.—It is laid down in the textbooks that where a contract does not specify what notice shall be given to determine the employment, a custom prevails in the profession to the effect that an indoor assistant may be dismissed at any time by a month's notice or payment of a month's salary; and we are inclined to think, having regard to the authorities, that, assuming this custom to be established, it would be imported into the contract in question, notwithstanding the implication to which our correspondent refers. We cannot, however, say that the question is altogether free from doubt, but would recommend our correspondent to obtain legal advice before resorting to proceedings. We do not think the claim—even if the engagement were construed as a binding one for a year certain—would be for the balance of the year's salary, with or without compensation for board and lodging, but for damages for wrongful dismissal, and it would be the duty of our correspondent to use his best endeavours to procure an engagement elsewhere at the earliest opportunity.

PUBLIC HEALTH AND POOR-LAW MEDICAL SERVICES.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns, including London, 6,359 births and 4,572 deaths were registered during the week ending Saturday, July 27th. The annual rate of mortality in these towns, which had increased from 15.4 to 21.9 per 1,000 in the six preceding weeks, further rose last week to 22.5. The rates in the several towns ranged from 11.8 in Brighton, 18.5 in Huddersfield, and 18.7 in Bristol to 30.9 in Liverpool, 30.1 in West Ham, and 31.5 in Preston. In the thirty-two provincial towns the mean death rate was 22.1 per 1,000, and was 0.9 below the rate recorded in London, which was 23.0 per 1,000. The zymotic death-rate in the thirty-three towns averaged 4.2 per 1,000; in London the rate was equal to 6.9 per 1,000, while it averaged 5.6 in the thirty-two provincial towns, and was highest in West Ham, Leicester, Liverpool, and Preston. Measles caused a death rate of 1.2 in Plymouth, Blackburn, and Liverpool; scarlet fever of 1.0 in Salford; whooping-cough of 1.0 in Cardiff; "fever" of 1.0 in Burnley; and diarrhoea of 6.4 in Bradford, 6.8 in Norwich, 7.3 in Sheffield, and 10.2 in Leicester and in Preston. The 77 deaths from diphtheria in the thirty-three towns included 48 in London, 4 in West Ham, and 1 in Wolverhampton. Two fatal cases of small-pox were registered in Oldham, and 1 in London, but not one in any other of the thirty-three large provincial towns. There were as many as 192 small-pox patients under treatment in the Metropolitan Asylums Hospitals and in the Highgate Small-pox Hospital on Saturday, July 27th, against 42, 71, and 89 at the end of the three preceding weeks; 115 new cases were admitted during the week, against 17, 36, and 23 in the three preceding weeks. The number of scarlet fever patients in the Metropolitan Asylums Hospitals and in the London Fever Hospital, which had been 2,044, 2,341, and 2,367 at the end of the three preceding weeks, had further risen to 2,347 on Saturday, July 27th; 249 new cases were admitted during the week, against 311, 332, and 220 in the two preceding weeks.

In thirty-three of the largest English towns, including London, 6,693 births and 4,907 deaths were registered during the week ending Saturday, August 3rd. The annual rate of mortality in these towns, which had increased from 15.4 to 22.5 per 1,000 in the seven preceding weeks, declined to 20.7 last week. The rates in the several towns ranged from 10.0 in Halifax, 10.5 in Huddersfield, and 11.8 in Brighton to 26.8 in Norwich, 30.0 in Wolverhampton, and 30.0 in Liverpool. In the thirty-two provincial towns the mean death rate was 20.2 per 1,000, and was 1.3 below the rate recorded in London, which was 21.5 per 1,000. The zymotic death-rate in the thirty-three towns averaged 3.8 per 1,000; in London the rate was equal to 6.5 per 1,000, while it averaged 5.3 in the thirty-two provincial towns, and was highest in Wolverhampton, West Ham, and Leicester. Measles caused a death-rate of 1.4 in Manchester, 2.0 in Blackburn, and 3.3 in West Ham; scarlet fever of 1.0 in Huddersfield; whooping-cough of 1.3 in Blackburn; and diarrhoea of 5.4 in West Ham, 5.6 in Birmingham, 5.8 in Nottingham, 5.9 in Liverpool, 6.1 in Sheffield, 6.3 in Salford, 6.8 in Norwich, and 10.0 in Leicester. The mortality from "fever" showed no marked excess in any of the large towns. The 76 deaths from diphtheria in the thirty-three towns included 57 in London, 3 in West

Ham, and 3 in Cardiff. Two fatal cases of small-pox were registered in Oldham, and one in London, but not one in any other of the thirty-three towns. There were 207 cases of small-pox under treatment in the Metropolitan Asylums Hospitals and in the Highgate Small-pox Hospital on Saturday, August 3rd, against 71, 89, and 100 at the end of the three preceding weeks; 60 new cases were admitted during the week, against 34, 23, and 115 in the three preceding weeks. The number of scarlet fever patients in the Metropolitan Asylums Hospitals and in the London Fever Hospital, which had been 2,341, 2,367, and 2,347 at the end of the three preceding weeks, had further risen to 2,423 on Saturday, August 3rd; 247 new cases were admitted during the week, against 304, 220, and 249 in the three preceding weeks.

HEALTH OF SCOTCH TOWNS.

During the week ending Saturday, July 27th, 819 births and 597 deaths were registered in eight of the principal Scotch towns. The annual rate of mortality in these towns, which had been 20.3 and 18.2 per 1,000 in the two preceding weeks, was 18.3 in the week under notice, and was 4.2 per 1,000 below the mean rate during the same period in the thirty-three large English towns. Among these Scotch towns the death rates ranged from 10.3 in Perth to 25.3 in Greenock. The zymotic death rate in these towns averaged 3.2 per 1,000, the highest rates being recorded in Paisley and Greenock. The 74 deaths registered in Glasgow included 24 from diarrhoea, 4 from whooping-cough, and 3 from measles. Two fatal cases of diphtheria were recorded in Edinburgh.

During the week ending Saturday, August 3rd, 959 births and 420 deaths were registered in eight of the principal Scotch towns. The annual rate of mortality in these towns, which had been 18.3 and 18.3 per 1,000 in the two preceding weeks, declined to 18.0 last week, and was 2.7 per 1,000 below the mean rate during the same period in the thirty-three large English towns. Among these Scotch towns the death rates ranged from 14.7 in Edinburgh to 28.5 in Paisley. The zymotic death rate in these towns averaged 2.9 per 1,000, the highest rates being recorded in Paisley and in Greenock. The 229 deaths registered in Glasgow included 22 from diarrhoea, 5 from whooping-cough, 2 from measles, 1 from scarlet fever, and 1 from diphtheria. Seven deaths from diarrhoea were registered in Dundee, and 6 in Greenock and in Paisley, and 4 deaths from whooping-cough occurred in Dundee.

THE REGISTRAR-GENERAL'S QUARTERLY RETURN.

THE Registrar-General has just issued his return relating to the births and deaths registered in England and Wales during the second, or spring, quarter of this year, and to the marriages during the three months ending March last. The marriage-rate was equal to 10.6 per 1,000 of the population, and was below the rate in the corresponding quarter of any year on record.

The births registered in England and Wales during the three months ending June last numbered 333,207, equal to an annual rate of 30.8 per 1,000 of the population, estimated by the Registrar-General to be nearly thirty and a half millions of persons in the middle of this year. This rate was, with two exceptions, lower than in the corresponding quarter of any previous year, and was 1.2 per 1,000 below the mean rate in the second quarter of the ten preceding years. The birth-rates in the several counties during the quarter under notice ranged from 23.9 in Sussex, 25.5 in Berkshire, and 28.0 in Surrey to 36.0 in South Wales, 36.1 in Staffordshire and in Monmouthshire, and 36.5 in Durham. In thirty-three of the largest English towns the birth-rate last quarter averaged 31.5 per 1,000, and exceeded by 0.7 per 1,000 the general English rate. In London the birth-rate was 30.5 per 1,000, while it averaged 32.1 in the thirty-two provincial towns, among which it ranged from 20.3 in Huddersfield, 22.5 in Halifax, and 25.6 in Brighton to 35.2 in Salford, 35.4 in Sunderland, and 37.5 in Liverpool.

The births registered in England and Wales during the quarter ending June last exceeded the deaths by 192,793; this represents the natural increase of the population during that period. It appears from returns issued by the Board of Trade that 81,030 emigrants embarked during last quarter from the various ports of the United Kingdom at which emigration officers are stationed for places outside Europe. Of these, 28,781 were English, 4,642 Scotch, and 35,429 Irish. Compared with the averages in the corresponding periods of recent years, the proportion of English and Scotch emigrants showed a considerable decline, while that of Irish emigrants showed an increase.

During the second quarter of this year the deaths of 120,411 persons were registered in England and Wales, equal to an annual rate of 17.3 per 1,000 of the estimated population; this rate was lower than that in the corresponding quarter of any year on record, with the single exception of 1894, when the rate was only 15.8 per 1,000. The lowest county death-rates last quarter were 12.9 in Middlesex, 12.4 in Rutlandshire, 12.9 in Surrey, and 13.4 in Berkshire and in Westmorland; while the highest rates were 20.1 in Cornwall, 20.8 in Lancashire, 20.4 in South Wales and in North Wales, and 20.7 in Cumberland. In the urban population of the country, estimated at about twenty and a half millions of persons, the rate of mortality during the quarter under notice was 17.4 per 1,000; while in the remaining and chiefly rural population of nearly ten millions it was 16.9 per 1,000. These rates were respectively 1.8 and 0.4 per 1,000 below the mean rates in the corresponding quarters of the preceding ten years. Among thirty-three of the largest English towns the mean death-rate was 17.8 per 1,000; in London the rate was 16.7 per 1,000, while it averaged 16.6 in the thirty-two large provincial towns, and ranged from 12.4 in Croydon, 14.4 in Portsmouth, 15.1 in Leicester, and 15.2 in Cardiff and in Nottingham to 22.4 in Burnley, 23.1 in Bolton, 23.9 in Manchester, and 24.4 in Liverpool. In sixty-seven other large towns, with an estimated aggregate population of about three and a half millions the mean death-rate was 16.9 per 1,000, or 0.9 per 1,000 below the mean rate in the thirty-three large towns.

The 130,411 deaths registered in England and Wales during the three months ending June last included 2,533 which resulted from whooping-cough, 2,467 from measles, 1,926 from diarrhoea, 1,492 from diphtheria, 783 from "fever" (including typhus, enteric, and ill-defined forms of "fever"), 778 from scarlet fever, and 80 from small-pox; in all, 9,999 deaths were referred to these principal zymotic diseases, equal to

an annual rate of 1.32 per 1,000, against an average rate of 1.17 in the corresponding quarters of the ten preceding years. The mortality from diphtheria and from diarrhoea showed a slight excess, while that for each of the other principal zymotic diseases was considerably below the average. Of the 25 fatal cases of small-pox registered last quarter in England and Wales, 4 occurred in Derby, 3 in London, 3 in Liverpool, and 3 in Oldham.

The rate of infant mortality in England and Wales last quarter, or the proportion of deaths under one year of age to registered births, was equal to 126 per 1,000, which corresponded with the mean proportion in the second quarters of the ten preceding years. In London the rate of infant mortality was 131 per 1,000, while it averaged 148 in the thirty-two large provincial towns, among which it ranged from 100 in Croydon, 101 in Huddersfield, and 116 in Nottingham to 171 in Manchester, 175 in Bolton, 178 in Burnley, and 189 in Preston.

The mean temperature of the air during last quarter at the Royal Observatory, Greenwich, was 65° F., and was 2.6° above the average in the corresponding quarters of 124 years; the mean temperature showed an excess of 1.7° in April, 3.5° in May, and 3.1° in June. The rainfall during the quarter amounted to 1.91 inch, and was only about one-third of the average.

MEDICAL NEWS.

BRUSSELS MEDICAL GRADUATES' ASSOCIATION.—The annual meeting and dinner of this Association took place at the Café Royal, Regent Street, on July 29th. Dr. Warburton, of Liverpool, was elected President for the year 1895-96; Dr. S. Sunderland, Vice-President; and Drs. Brookhouse, Burland, Thomas, Hearnden, Gabe, Achard, Snape, Turtle, Naumann, and Wunderlich, members of Council. At the dinner which followed there were present among the guests Sir Walter Foster, Dr. Glover, Mr. John Langton, and other well-known gentlemen. Dr. Snape, in proposing the toast of "The British Medical Association," drew attention to the great desire of many of its members that that Association should undertake a wider circle of duties, more particularly alluding to the question of medical defence. Sir Walter Foster, in replying, said that he sympathised with the wishes of the speaker, but feared there were grave difficulties in the way of carrying out the desired change. He particularly complimented the Brussels graduates on their admirable organisation, and said that personally he was in favour of their being allowed to register their degrees as additional qualifications. Dr. Beresford Ryley, in proposing "The Guests," gave the history of the Brussels Medical Graduates' Association, and of their agitation in 1886 to get their degrees registered, which was so ably assisted by Sir Walter Foster; he trusted that the latter and Dr. Glover would use their best efforts on the Council to get for graduates of Brussels since 1886 the same right granted by the Medical Act of that year to graduates before that date. Dr. Glover, in his reply, expressed a very strong opinion in favour of this registration, but thought that the present inability to register was partly owing to the refusal of the Belgian Government to allow reciprocal advantages to English practitioners in Belgium. Dr. Pocock, in a subsequent toast, pointed out that Dr. Glover was under a little misapprehension as to the objects of the Brussels Medical Graduates' Association; they did not wish that any foreigner should be put on the Register for foreign qualifications—indeed, they would strongly object to it, unless he also held English ones; their contention only was that those who were already on the Register for English qualifications ought to be allowed to register, if they thought fit, any foreign degrees they might have obtained after examination from a State-recognised university. Dr. Glover acknowledged this correction, and thought that the contention of the Brussels graduates was an exceedingly reasonable one.

BRITISH LARYNGOLOGICAL, RHINOLOGICAL, AND OTOLOGICAL ASSOCIATION.—The annual summer meeting was held on July 26th and 28th, Dr. W. McNeill Whistler, President, in the chair. A discussion on the Surgical Treatment of the Accessory

Cavities of the Nose, was opened by Dr. J. N. Mackenzie (Baltimore), who dealt with Empyema of the Antrum of Highmore. He was in accord with Freeman, who opened below the nasal duct, but considered that the opening by an alveolus was required in all but recent cases. Dr. Luc (Paris) dealt with Disease of the Frontal Sinus. His method of operation consists in opening wide by the anterior wall of the sinus, and establishing a free communication with the nose by means of an india-rubber drain. Dr. Bryson Delavan (New York) confined his observations to Ethmoidal Disease; and Dr. F. H. Bosworth (New York) said he favoured his method of gaining access to the cells after removal of the anterior end of the middle turbinal was by the use of a drill. Dr. W. H. Daly (Pittsburg), Dr. Roaldes (New Orleans), Mr. Mayo Collier, and Dr. Dundas Grant continued the discussion. The subject of the treatment of Laryngeal Stenosis was opened by Dr. Sajous (Paris), who dealt with the stenotic conditions of the infraglottic space. A paper on this subject by Professor Massel (Naples) followed. On July 26th Dr. Krause (Berlin) and Dr. Heryng (Warsaw) opened a discussion upon the Surgical Treatment of Laryngeal Tuberculosis, and described their methods of treatment by curettement and the application of lactic acid. Dr. Gleitmann (New York) stated that he had adopted, with certain slight modifications, the methods originated by Heryng and Krause. Dr. Sims Woodhead introduced a discussion upon the Antitoxin Treatment of Diphtheria, and described his views and experiences as gained from an investigation of 2,000 cases. He supported the treatment not only for diphtheria, but also as a prophylactic against its occurrence in those exposed to infection. Mr. L. Browne, Mr. Macintyre, and Dr. Roaldes closed the discussion. The Society dined at the Langham Hotel on Friday night, and a very successful meeting was then concluded.

HOSPITAL SATURDAY FUND.—A sum of nearly £10,000 has now been received at the central offices of the Hospital Saturday Fund on behalf of the present year's collection. This amount has been derived from collections in the various Metropolitan business houses and workshops, and the ladies' street collection of July 13th. In many of the industrial establishments of London weekly collections will be continued until Christmas.

MEDICAL VACANCIES.

The following vacancies are announced:

- BOROUGH OF BOOTLE HOSPITAL FOR INFECTIOUS DISEASES.**—Medical Superintendent, unmarried. Salary, £100 per annum, with board, washing, and apartments. Applications to the Chairman of the Health Committee, Town Hall, Bootle, by August 14th.
- CUMBERLAND INFIRMARY, Carlisle.**—House-Surgeon. Salary, £50 per annum, with board, lodging, and washing. Appointment for one year. Applications to the Secretary by August 24th.
- CHICHESTER INFIRMARY.**—House-Surgeon. Salary, £50 per annum, with board, lodging, and washing. Applications to the Secretary by August 14th.
- EAST SUFFOLK AND IPSWICH HOSPITAL, Thoroware, Ipswich.**—Second House-Surgeon; unmarried; doubly qualified. Salary, £50 per annum, with board, lodging, and washing. Applications to the Secretary by August 14th.

The gentleman appointed will also be appointed Public Vaccinator for the Registration Subdistrict of Wolverhampton East. Applications to Edwin Pritchard, Clerk to the Guardians, Union Offices, St. Peter's Church, Wolverhampton, by August 18th.

MEDICAL APPOINTMENTS.

ASTON, Dr. J. P., appointed Medical Officer for the Northern District of the Lancaster Union.

BARK, Dr. Wm. H., appointed Medical Officer of Health for the Chislehurst Rural Sanitary District, vice C. Randolph, F.R.C.P., M.R.C.S.

BRADLEY, John G., F.R.C.P. Edin., L.P.P. Glas., appointed Medical Officer of Health to the Rowley District Council.

BRAND, A. T., M.D., C.M., appointed Certifying Factory Surgeon for the District of Driffield, East Norfolk, vice Dr. Burgess, deceased.

BROOK, G. A., M.R.C.S. Eng., L.R.A., appointed Medical Officer for the Workhouse and Trade Union District of the Redwally Union.

BULLOCK, William, M.D., appointed Assistant Bacteriologist in the Anti-toxin Department of the British Institute of Preventive Medicine.

BURBELL, Lionel C., M.A., M.R.Cantab., M.R.C.S. Eng., L.R.C.P. Lond., appointed House Surgeon to the Suffolk General Hospital, vice G. Master, M.B. Camb., M.R.C.S. Eng., L.R.C.P. Lond., resigned.

CAMPBELL, Henry Johnstone, M.D., F.R.C.P. Lond., M.R.C.S., appointed Honorary Physician to the Bradford Infirmary, vice W. G. Graham, M.D. Lond., resigned.

CARDALE, Henry J., M.B., C.M. Edin., appointed Assistant House Surgeon to Royal Albert Hospital, Devonport, vice T. Over, resigned.

CHAPPEL, George P., M.B., B.C. Camb., appointed Resident Medical Officer to the City of London Hospital for Diseases of the Chest, Victoria Park.

COYNE, Arthur R., M.R.C.S., L.R.C.P., L.D.S., appointed Assistant Dental Surgeon to the Dental Hospital of London.

DAKYNNE, T. E., L.R.C.P. Edin., M.R.C.S. Eng., appointed Medical Officer for the Leek District of the Leek Union.

DONE, James, L.R.C.P., L.R.C.S. Edin., appointed Medical Officer of Health for the Golborne Urban Sanitary District.

DYKE, Bernard, appointed Analyst to the County of Rutland, vice W. L. Emmerson, M.D. Aberd., deceased.

FLETCHER, T. J., M.B., C.M. Edin., appointed Medical Officer for the Castle Donington District of the Eardlow Union.

GARNER, Mr. H. K., Jun., appointed Assistant Medical Officer at the Workhouse of the Parish of St. Matthew, Bethnal Green.

GODDARD, Charles E., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer of Health to the Wembley Urban District Council.

GOOVA, W. E., M.B. Camb., M.R.C.S., L.R.C.P. Lond., appointed Medical Officer to the St. Ives Union Workhouse.

HALL, G. Capel, M.R.C.S. Eng., L.V.A., appointed Medical Officer for the Ombersley District of the Droitwich Union.

HARRIS, H. G., M.R.C.S. Eng., L.R.C.P. Lond., appointed Medical Officer of Health for the East Stow Rural Sanitary District.

KHARRAD, Frederic P., M.B., C.M. Edin., appointed Second Assistant Medical Officer to the West Riding Asylum, Wakefield, vice M. Craig, M.B., resigned.

HUNTER, Mr. David, appointed Fourth Assistant Medical Officer to the West Riding Asylum, Wakefield, vice F. O. Simpson, L.R.C.P., M.R.C.S., promoted.

JAMESON, Dr. J. H., appointed Medical Officer for the Ardfleigh and Great Bromley and Wals District of the Tendring Union.

JEVY, J. M.B., C.M. Aberd., appointed Medical Officer for the Norton District of the Leek Union.

JENNINGS, T. G., F.R.C.S., L.R.C.P. Lond., D.P.H. Lond., appointed Certifying Factory Surgeon for the Farnborough District.

LYON, H. Willoughby, M.R.C.S. Eng., L.R.C.P. Lond., appointed Lecturer in Animal Surgery and Demonstrator of Physiology at King's College, London, vice T. G. Brodie, M.D. Lond., resigned.

MCINTOSH, S. M.B., B.S. Durh., appointed Medical Officer for the Tenth District of the Hexham Union.

MONROE, S. Ernest, M.R.C.S., L.R.C.P., appointed Senior House Surgeon to Shobdon General Infirmary, vice W. S. Kerr, M.B., C.M., resigned.

NEWBY, James Thomas, L.R.C.P. Edin., D.S.S. Vict., appointed Physician to and Medical Superintendent of the Fever Hospital of the Leigh Joint Hospital Board.

PAULSEN, M. H. U., L.R.C.P. Lond., L.R.C.S. Edin., appointed Medical Officer for the Second District of the Newbury Union.

REILLY, F. H., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer of Health to the Huddersfield Urban Sanitary District, vice H. J. Molyneux, L.R.C.P. Edin., M.R.C.S. Eng.

REYNOLDS, J. J., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer for the Chertsey Fitzpaine District of the Crediton Union.

ROBERTS, F. H., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer of Health for the Handsworth Wells Urban Sanitary District.

ROBERTS, J. L., M.B., C.M. Edin., appointed Medical Officer for the Cornholme District of the Todmorden Union.

SIMPSON, Francis O., L.R.C.P., M.R.C.S., appointed Pathologist and Third Assistant Medical Officer to the West Riding Asylum, Wakefield, vice W. L. Anderson, M.D., resigned.

SMYTH, Joshua O., M.R.C.S. Eng., L.R.C.P. Edin., appointed Medical Officer of Health to the Wells Rural District, vice H. W. Livett, L.R.C.P. Edin., M.R.C.S. Eng., resigned.

SNOWDEN, Geo. H. H., M.R.C.S. Eng., reappointed Medical Officer for the Hafford District of the North Lincolnshire Union.

STUART, J. A. E., L.R.C.S., L.R.C.P. Edin., appointed Medical Officer of Health to the Bailey Urban Sanitary District, vice A. Swann, M.D. Brux, M.R.C.S. Eng., deceased.

TAYLOR, A. E. M., M.R.C.S., appointed Medical Officer for the Gillingham District of the Hartlepool Union.

TAYLOR, J. W., M.R.C.S., L.R.C.P. Lond., appointed Medical Officer of Health for the Methley Urban Sanitary District, vice G. W. Wigan.

THOMSON, Frederic, M.B. Aberd., D.P.H. Lond., appointed Temporary Medical Superintendent at the Gore Farm Hospital.

WILLIAMS, Dr. E., appointed Medical Officer of Health for the Penilly Rural Sanitary District.

WILKIN, Dr., appointed Medical Officer of Health for the Staudish Urban District, vice J. A. Marsden, M.R.C.S. Eng., resigned.

DIARY FOR NEXT WEEK.

TUESDAY.

THE CLINICAL MUSEUM, 21, Great Portland Street—Open at 2 P.M., Lectures at 4.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 5s. 6d., which sum should be forwarded in post office order or stamp with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

BIRTHS.

PENROSE—On August 18th, at Wimbledon, the wife of F. G. Penrose, M.D., F.R.C.P., of 4, Harley Street, of a daughter.

THOMSON—On July 1st, at Marsh Parade, Newcastle-under-Lyme, the wife of Sydney W. Thompson, F.R.C.S. Edin., District Medical Officer for Her Majesty's Niger Coast Protectorate, West Africa, of a son.

MARRIAGES.

ANDERSON-PETTINGROW—At the Cockburn Hotel, Glasgow, on August 1st, by the Rev. R. Bert Craig, M.A., Edinburgh, Robert Yull Anderson, M.B. (C.M. Edin.) to Jessie, second daughter of the late William J. Pettingrow, Ironfounder, Wishaw.

GIMON-MOORE—August 1st, at Burgess Hill, by the Rev. E. F. H. Boddy, Vicar of Eton, Middlesex, assisted by the Rev. W. La Mare Evans, Vicar of the Parish, William Jacob Gibson, eldest son of Dr. Septimus Gibson, to Margaret Coope Moore, youngest daughter of the late W. Withers Moore, M.D., F.R.C.P.

MARCH-MANNING—On July 21st, at St. Andrew's Church, Laverstock, near Salisbury, by the Rev. H. Cromwell Bush, Vicar of the Parish of Laverstock, and Minor Canon of Salisbury, assisted by the Rev. J. Haskell Potter, Vicar of Holy Trinity, Upper Tooting, and Rural Dean of Streatham, Joseph Cedric March, M.R.C.S. and L.R.C.P., of St. John's House, Lechliffe, Gloucestershire, to Grace Eliza, elder daughter of Henry John Manning of Laverstock, Salisbury.

STEPHENSON-PECK—On July 1st, at the Parish Church, Wigan, by the Rev. John Stephenson, M.A., Vicar of Bolton, and the Rev. Gerard Finch, M.A., Honorary Fellow of Queens' College, Cambridge, Sydney Stephenson, M.B. (of Welbeck St. W.), only son of Appleby Stephenson, M.D. (of Nottingham), to Jane Finch, daughter of the late J. H. Peck, Esq., J.P., of Southport, and of Mrs. Peck, Gidlow Lodge, Wigan.

DEATHS.

ECCLER—On Friday, August 2nd, after fifteen months' patient suffering, Effie Miller (Nellie), the beloved wife of A. Symons Eccles, M.B., of 23 Bedford Street, Mayfair, W.

FALLON—On July 17th, at 77, Northbrooke Road, Wandsworth Common, S.W., Robert Tucker Fallon, L.R.C.S. and L.R.C.P. Edin., L.F.P.S. Glas., of intestinal obstruction, aged 43 years.

REWER—On July 21st, suddenly, John Thomas Rewer, L.F.P.S. Glas., aged 51 years.

LETTERS, NOTES, AND ANSWERS TO CORRESPONDENTS.

COMMUNICATIONS FOR THE CURRENT WEEK'S JOURNAL SHOULD REACH THE OFFICE NOT LATER THAN MIDDAY POST ON WEDNESDAY. TELEGRAMS CAN BE RECEIVED ON THURSDAY MORNING.

COMMUNICATIONS respecting Editorial matters should be addressed to the Editor, 493, Strand, W.C., London; those concerning business matters, non-delivery of the JOURNAL, etc., should be addressed to the Manager, at the Office, 493, Strand, W.C., London.

ADVERTISERS desiring reprints of their articles published in the *BRITISH MEDICAL JOURNAL* are requested to communicate beforehand with the Manager, 493, Strand, W.C.

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—of course not necessarily for publication.

CORRESPONDENTS not answered are requested to look to the Notices to Correspondents of the following week.

MANUSCRIPTS FORWARDED TO THE OFFICE OF THIS JOURNAL CANNOT UNDER ANY CIRCUMSTANCES BE RETURNED.

IN order to avoid delay, it is particularly requested that all letters on the editorial business of the JOURNAL be addressed to the Editor at the Office of the JOURNAL, and not to his private house.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, on forwarding their Annual and other Reports, favour us with duplicate copies.

Queries, answers, and communications relating to subjects to which special departments of the *BRITISH MEDICAL JOURNAL* are devoted will be found under their respective headings.

QUERIES.

M.B. asks for advice in the treatment of a child aged about 6 years who cannot be prevented from eating grass, clay, dust off the road, etc.

W. P. W. wishes to hear of a home for a lady suffering from chronic heart disease. She can afford to pay about 12s. 6d. to 18s. weekly; neighbourhood of London, Worcestershire, or Warwickshire preferred.

SCALPITIS: A young lady of 24 years, who became hopelessly deaf five years ago, and whose voice is, I fear, degenerating, is most anxious to learn lip reading. Would any of your readers kindly tell me where it is efficiently taught in London or suburbs on reasonable terms.

P. J. D. asks to be recommended a line of treatment for a very severe case of diabetes insipidus occurring in a child 14 months old. There is great wasting, constant micturition, and insatiable thirst. The present patient had a brother who suffered from a similar affection, and finally succumbed to an attack of whooping-cough. They both developed the disease at the time of weaning.

ENQUIRER wishes to be informed what means there are available at the present time for the raising of sewage from a lower level to communicate with the main or central drain of a small town, where elevation by pumping machinery would be prohibitive on account of the cost. Are there, he adds, any publications which would give the information required?

F. V. writes: Could you give me the formula for the disinfecting spray used in France, and praised so highly by Dr. Dujardin-Beaumet?

* The solution used in the Paris Municipality for the disinfection of rooms by the Equifax sprayer is 1 per 1,000 perchloride of mercury, with 2 per 1,000 of sea salt. Alternatively 2 per 1,000 tartaric acid may be substituted.

ENQUIRER asks how long a Pasteur-Chamberland filter will continue to free water from microbes without renewing the filtering candles.

* No limit has yet been ascertained to the time over which a Pasteur-Chamberland filter will continue to free water from microbes without renewing the filtering candles; and, judging by the experience of ten years it is probable that this capacity continues indefinitely.

ANSWERS.

M. D. writes: C. I. K. will find full instructions regarding hypodermic medication in capsules in *Osborne Will's Lectures on Genito-Urinary Diseases*, published by the Scientific Press, Limited.

BOOKS FOR NEWLY MARRIED LADIES.

H. E. W.—Two books which have been much used for the purpose mentioned are *Advice to a Wife on the Management of Her Health*, by F. H. Chavasse (Lancet), and *Hints to Mothers for the Management of their Health during the Period of Pregnancy and in the Lying-in Room*, by Thomas Hall, revised by Robert W. Parker (Longmans, Green, and Co.).

CONTRIBUTION.

Mr. GEORGE STEPHEN PERRINS (Wimpole Street, W.) writes: In reply to "Sap," he will find it advantageous to attend to the following points: (1) That the mucous layer be left longer than the skin, so that the wound may not come in contact with the glass, which is frequently sore from adhesions having to be broken down; (2) that, after having cut off the elongated prepuce, the mucous layer be divided on the dorsum

by a longitudinal incision: this prevents all possibility of constriction from contraction. (3) The frenum should be cut away, the transverse artery tied, and this part allowed to granulate. (4) Stitches should be freely used to bring skin and mucous layers into apposition.

THE DENTAL HOSPITAL OF LONDON AND ARTIFICIAL TEETH.

J. J. D.—The Dental Hospital of London is not, we understand, sufficiently supported by public contributions to enable the authorities to supply patients with artificial teeth gratuitously. As soon as sufficient funds are forthcoming, the hospital will gladly abolish all payments, but with a view to obviate bankruptcy and also to be of service to the poor, a fee has been charged for artificial teeth that may in some measure meet the necessary expenditure incurred in carrying on a mechanical department.

NOTES, LETTERS, Etc.

CLAIMS FOR REFUND OF INCOME TAX.

THE INCOME TAX REPAYMENT AGENCY (8, Chichester Road, Paddington, London, W.) writes: So many erroneous statements have appeared as to the date up to which claims can be made for a refund of income tax when a loss has been incurred in trade, occupation, vocation, or farming for the year ended April 5th last or date preceding when accounts are usually made up, that we would ask your permission to state that the last day is October 5th, but it is advisable to give notice at once and to obtain acknowledgment of such notice. There will then be time to make out accounts which have only to be sent in when asked for. We would remind all persons who have made a loss that income tax can be obtained back, not only when it has been paid on estimated profits but also when it has been deducted from other income. Say that a person in business or occupied in farming has been assessed and paid on profits estimated at £200, but in reality has made a loss of £100, and that he or his wife have other income from property or investments amounting to £200, he would be entitled to a refund of income tax on £200, and this would entitle him to a further refund of income tax on exemption, and he would thus recover the whole of the income tax paid or deducted. In this case it would amount to £40. We are at all times glad to give gratuitous information as to whether a claim can be validly made, and, on receipt of stamped addressed envelope, will send a form of notice of claim. Applicants should inform us whether the claim is on account of actual loss or merely on account of decreased profits, as the notice is different.

A DISTINCTION NOT WITHOUT A DIFFERENCE.

MR. D. BIDDLE (Kingston-on-Thames) writes: It may seem ungracious to take exception to anything contained in the admirable opening address of the President of the British Medical Association as reported in the columns of the *BRITISH MEDICAL JOURNAL*. But I feel it my duty to point out that the last line of poetry with which he closed his remarks is a mistranslation of the passage from which it is evidently taken. For this no doubt the poet is answerable, and it is a pity, for otherwise the utterance is grand:—

"Look forth, my soul!
(Nor in this vision be thou slow to trust)
The living waters, less and less by guilt
Stained and polluted, brighten as they roll,
Till they have reached the eternal city, built
For the perfected spirits of the just!"

In both the authorised and the revised versions of Hebrews xii, 19, the rendering is ambiguous, namely, "To the spirits of just men made perfect," but on referring to the original Greek, there can be no doubt as to the meaning, for the words are *πνεύματα δικαίων τελειωμένων*, to the spirits of perfected just ones.

It is now twenty-six years since, in a small work entitled *The Spirit and Consistency*, I endeavoured to show that the human spirit is not subject to the changes and fluctuations which mark the human body, but that it needs a body in order to realise a conscious existence. Of course such a view cuts at the root of the doctrine of Purgatory, and also of prayer to departed souls, and is diametrically opposed to the whole theory of Spiritualism. Hence you will not be surprised to hear that my book was assailed tooth and nail by the late Professor De Morgan in the pages of the *Athenaeum*. But my confidence in the substantial truth of my argument remains unshaken, and I consider the doctrine of the resurrection of the body—in contrast to the Platonic dogma of the immortality of the soul—as testifying almost more than any other to the scientific character of Christianity. Perfected spirit is more impossible than perfected oxygen.

TWINS: BOTH BORN WITHOUT RUPTURE OF MEMBRANES.

MR. W. PETER SIMPSON, M.R.C.E.D. (Tattershall, Lincs.) writes: On the afternoon of July 11th I was called to attend Mrs. L., who lies about three miles away, in her confinement. Her age was 26, and this was her third confinement. I found that both children had been born half an hour previously. In both cases the placenta and membranes were expelled with the child, and in both the membranes were unruptured. The first child, a female, was a breech presentation, and the second a male a vertex. The second child was born about five minutes after the first. In both cases life was extinct. There was no abnormal appearance about either placenta, nor were the membranes specially tough. The labour was almost absolutely dry, as no waters escaped, and little or no blood. Both children were about 14 months. The woman says she did not expect until the end of August.

TREATMENT OF FETID EXCRETION BY CHARCOT VAPORS.

DR. CHARLES FORBES (London), late Surgeon-Waite, Gold Mines, West Africa, etc., writes with reference to Dr. Charcot's paper in the *BRITISH MEDICAL JOURNAL*, June 24th, 1905, p. 1121: My own experience has led to much the same results in a few cases. However I differ with him on two crucial points, namely, (1) His plan could only be carried out conveniently in a hospital; (2) The charcoal advised, namely, coal tar, though antiseptic, is too toxic and irritating. My own plan would

be quite as beneficial and decidedly more grateful to these patients. For the past nine months I have been using the purest bee-hive oil obtained (after H. Robinson and Guttmann) my formula being B. essential purified (oil of sweet almond) of oil of castor oil 10 parts each. To apply this solution continuously for long periods to the larynx, trachea, and lungs, I invariably make use of the globe inhaler, devised by Dr. Linton, as being the only spray diffuser from which vapour can be drawn through the nose into the lungs for any length of time without giving rise to a catarrhal state of the delicate mucous membrane.

PAINLESS SLAUGHTER OF CATTLE

THE REV. F. LAWRENCE (Hon. Sec. Church Sanitary Association) writes: At a trial held under the auspices of the Promotion of Kindness to Animals Society, at a slaughterhouse behind the Church House, Westminster, it was conclusively proved that an animal can be slaughtered painlessly and instantaneously by means of a short rifle barrel, in a manner which is simple, easy, and practically noiseless. A question arises, does this method leave the meat in as good condition as possible for human consumption? I have instituted inquiries in this direction, and up to date have not received other than confirmation of the opinion formed by a practical man at Birmingham—that this mode is in every way superior to any in use at the present time. It would be an advantage if some of your readers would give their judgment upon this important subject.

A CURIOUS POULTICE

MR. HENRY T. SMITH, M.R.C.S. Eng., etc. (Northfleet, Kent), writes: "Cow-dung poultices" are very commonly used in the country for skin diseases. Moreover, horses' feet are commonly "stepped" with cow-dung when the frog is very dry and brittle. Strange to say I have never seen this filthy poultice do any harm in the human being.

DR. J. FLETCHER WILTON (Weymouth) writes: I saw some thirty-five years ago an old woman living in one room who had applied a cow-dung poultice to a large chronic ulcer in the calf of the leg. I remonstrated with her on this filthy proceeding, which had been in use for some weeks. I ordered a bread poultice to cleanse the wound, and saw her again in two days. Her room was very offensive, and she removed a large brown mass, which she told me was a bread poultice. On inquiring how it was made, I found that she had cut a round of bread about three quarters of an inch thick from a loaf, toasted it to a nice brown on both sides, and then, to complete the poultice, had steeped it in her own urine.

DR. W. J. CULLEN (St. Roswell, N.B.) writes: Fully twenty years ago, in the island of Islay, Argyshire, the cow-dung poultice was much in vogue. Wherever a "gathering" proved obstinate, either in the breast or elsewhere, a hot cow-dung poultice was frequently applied, and often with good results. The popular idea in connection with them being that the pores of the skin contain a decoction (sic) of herbs, thus acting not only as a poultice but at one and the same time as a soothing application to the affected part. The poultices were applied until the patient burst, and as long as there was any continuance of the discharge, the after-process of healing being effected by frequent bathings with whisky and water, and the wound covered with either an ivy, cabbage, or dock leaf.

W. M. (Durham) writes: I can go further than Dr. Bate in this matter. It was the case of an abscess of the cheek in a young man. When I saw the patient his cheek was entirely enveloped in a big poultice, which consisted of cow's "shearin," that is, cow's dung. I was informed, The breast might have been considered bad enough, but the idea of having two face poultices in this fashion was revolting in the extreme. It was evidently a recognised method of curing abscesses among the laity in this county. Possibly the reason for such uncanny methods of treatment may be the idea of impressing the senses in a vigorous manner, and thus aiding the cure—one would at any rate think so from the substances which are in daily use in this part of the world. Paraffin is another household remedy for external and internal use, and young children are frequently dosed with it when suffering from bronchitis.

A CHINESE MEDICAL ACADEMY IN PEKIN

THE present month of July is, says the *Western Morning News*, to witness the inauguration of a strange experiment at Peking, in connection with the Anting Hospital and Huiwen College there. At the latter the English language is taught, and when Chinese students have been desirous of taking up the study of Western medicine and practical surgery, it has been necessary for them to first acquire sufficient proficiency in English for them to do so. Henceforth five professors will teach special branches of these subjects in Chinese, and entrance to the academy devoted to this work will be open to those who have not learned English. As the Chinese Generalissimo of Manchuria has resorted to a foreign physician during a severe illness which Chinese pharmacy did not benefit, it is evident that the advantages of Western science are becoming better appreciated, and there is doubtless a future of wondrous usefulness before the Chinese Medical Academy which Dr. Robert Colman is establishing at the Chinese capital.

LETTERS, COMMUNICATIONS, Etc., have been received from:

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

Eight lines and under	40	4	0
Each additional line	0	0	6
A whole column	1	17	6
A page	5	5	0

An average line contains six words.

Advertisements should be delivered, addressed to the Manager, at the Office, not later than noon on the Wednesday preceding publication; and if not paid for at the time, should be accompanied by a reference.

Post-Office Orders should be made payable to the British Medical Association at the General Post-Office, London. Small amounts may be paid in postage stamps.

N.B.—It is against the rules of the Post Office to receive letters at *Postes Restantes* addressed either in initials or numbers.

BRITISH MEDICAL ASSOCIATION. SIXTY-THIRD ANNUAL MEETING.

AN ADDRESS

DELIVERED AT THE OPENING OF THE

SECTION OF PHARMACOLOGY AND THERAPEUTICS

At the Annual Meeting of the British Medical Association at
London, July-August, 1895.

By **SIR WM. ROBERTS, M.D., F.R.S.**,
Formerly Professor of Medicine in Victoria University;
President of the Section.

ON ANARCOTINE—A NEGLECTED ALKALOID OF OPIUM.

My first duty is to offer, on behalf of myself and my colleagues, a hearty welcome to those who will favour the Section with their attendance. All are equally invited to take part in our discussions—not only those who are members of the Association, but also those foreign guests who honour us with their presence. The business of the Section has been carefully arranged by the Secretaries. This morning there will be a discussion on serum therapeutics. The initiation of the discussion has been entrusted to the competent hands of Dr. Klein and Dr. Washbourn, who will be followed by other experts on this subject. To-morrow we propose to discuss the requirements of the profession with regard to the impending revision of the *British Pharmacopœia*. On this topic we expect to hear not only the professors and teachers of materia medica and pharmacology who have been announced to speak, but also the voices of some who are engaged in general practice. The Committee of Revision will be glad to receive from the latter hints and information which will enable them to make the new edition as useful as possible to the mass of the profession, for the wants of whom the work is especially designed. The list of papers offered to the Section is a long one; so long that it will obviously be impossible to read them all in full within the time at our disposal. Some will have to be taken as read, or their contents will be given in brief by their authors; all the papers will, however, be submitted to the careful consideration of the officers of the Section and will, on approval, be published in the *JOURNAL of the Association*.

I propose to utilise the remainder of the time allotted to me as occupant of this chair in calling attention to the properties of a neglected alkaloid of opium, namely, anarcotine. During my travels in India last year, as a member of the Royal Commission on Opium, I heard a good deal about anarcotine and its employment in years gone by as a febrifuge in the treatment of the malarial fevers which are so prevalent in that country.

By far the most abundant alkaloids of opium are morphine and anarcotine, and while morphine represents the anodyne and hypnotic qualities of the drug, anarcotine represents, as I shall presently show, its antimalarial qualities. There are considerable differences in the proportion of morphine and anarcotine in the several varieties of commercial opium. These differences are especially pronounced in the case of Smyrna opium, which is used in this country for medicinal purposes, and Bengal opium, which is popularly used in India. These differences are set forth in round numbers in the subjoined table:

	Smyrna Opium.	Bengal Opium.
Morphine	8 per cent.	4 per cent.
Anarcotine	2 per cent.	6 per cent.

It will be observed that Bengal opium is comparatively poor in morphine but very rich in anarcotine. Smyrna opium, on the other hand, is very rich in morphine and very poor in anarcotine.

Anarcotine was brought into prominent notice in India about fifty years ago. At that time quinine became very scarce and dear. The supplies of bark from South America were failing, and it had not yet been proved that the quinine-bearing cinchonas could be cultivated with success on the uplands of India. There was thus a serious prospect of a dearth of quinine in India, and the Indian medical authorities had to cast about for some cheaper and more abundant substitute. Now, opium had long been held in high repute among the natives of India as a remedy and protective against malarial fevers; and habitual opium eaters were said to enjoy a remarkable immunity from malarial infection. Attention was therefore directed to anarcotine, which is the most abundant alkaloid of Bengal opium, and trials were made of its curative power in malarial fevers. Sir William O'Shaughnessy, in 1838, brought the subject before the Calcutta Medical Society. He gave an account of 32 cases of intermittent and remittent fevers treated with anarcotine. Of these, 31 were cured. He also mentioned 100 other cases which had been treated by his pupils and colleagues with equal success.

These results, and others of a like character, induced the Indian authorities to institute further experiments, and these proving favourable, they caused anarcotine to be prepared in quantity at the laboratories of Ghazipur and Patna, and distributed to the medical depôts throughout British India.

Two important communications on the antiperiodic powers of anarcotine lie buried in the medical archives of India, and deserve resuscitation. They are based on a large experience, and they prove incontestably that anarcotine is scarcely inferior—and in some classes of cases is superior—to quinine as an antiperiodic. The first, from Dr. Palmer, is contained in a letter to the Director-General of the Indian Medical Department, and is reprinted in the *Proceedings of the Opium Commission*, vol. v. p. 78.¹ In 1857-9 Dr. Palmer treated at Ghazipur 546 cases of malarial fever with anarcotine, in doses ranging from 1 to 3 grains. Of these, 541 were cured and only 5 died. In addition to these 546 officially reported cases, he treated with anarcotine a large number of other cases of malarial fever, amounting in all to little short of 1,000 cases. Summing up his general experience, he states that in 70 per cent. the fever was arrested at the second paroxysm after the medicine was administered; in 20 per cent. the arrest was equally sure, but was not quite so quick; and in 10 per cent. the medicine did not appear to have any curative effect. He farther remarks that there are cases where anarcotine is decidedly more efficacious than quinine—namely, where there is an intolerance of quinine, and where quinine has been given without any effect for a long time.

The second communication is a "Report on Anarcotine" by Dr. Garden, which is printed in the seventh volume of the *Indian Annals of Medical Science*. Dr. Garden succeeded Dr. Palmer in civil charge of the Ghazipur Station in 1859; and at that time a severe outbreak of intermittent fever, of quotidian and tertian type, had to be dealt with. Taking advantage of the opportunity he subjected anarcotine to an extensive trial. He treated altogether 684 cases, and gives details of 134. Of these 134 cases 127 were rapidly cured by anarcotine. It only failed in 7 cases, or 5.6 per cent. It, moreover, cured some cases where quinine had failed. The doses he employed ranged from 1½ to 3 grains. He expresses his general conclusions in the following words: "That it (anarcotine) is equal in value to quinine I do not pretend to say, but that it has a claim to the next place in the ranks of antiperiodics is, I think, an undoubted fact."

Anarcotine continued in large demand in India for several years, and was regularly supplied from the Government factories, at the rate of about a hundredweight per annum. Altogether, during the years of quinine dearth, not less than a ton of anarcotine was made and consumed in India in the treat-

¹ Copies of the *Proceedings and Report of the Opium Commission* have been deposited in the libraries of the British Medical Association, the London College of Physicians, and the Royal Medical and Chirurgical Society.

ment of malarial fevers. The day of prosperity of anarcotine, however, proved to be brief. With the success of cinchona cultivation on the Darjeeling hills quinine became again abundant and cheap; and the older and better known febrifuge speedily displaced its younger rival. At the present day, thanks to the skill and patriotic efforts of Dr. George King, the distinguished superintendent of the Calcutta Botanical Gardens, the natives of India are better provisioned with quinine than any population in the world. Dr. King has brought into operation a scheme whereby the local post offices are supplied with sealed packets, each containing 5 grains of pure quinine. These packets are sold to all comers at the rate of about one farthing a piece of our English money. By the courtesy of Dr. King I am able to show you samples of these wonderful little packets. Some are inscribed with English characters and some with native characters. This system is being gradually extended throughout the length and breadth of British India; and you can easily realise what an incalculable boon this is likely to prove in the fever-stricken regions of that country.

But to return to anarcotine. It is to be observed that Dr. Palmer and Dr. Garden perceived a distinction between quinine and anarcotine, and recognised that there were cases of malarial fever which resisted quinine but yielded to anarcotine. Both observers also noted that in a certain percentage of the cases anarcotine proved wholly ineffective. These discrepancies are probably to be explained by the facts brought to light in recent researches on the infective organisms of paludal fevers. It has been shown that these organisms are of more than one kind, and that each kind corresponds to a particular type of malarial fever. There seems to be valid evidence that in anarcotine we possess a second antiperiodic of great power analogous to, but not identical with, quinine; and the point I wish to press upon those who have opportunities of studying malarial fevers, especially upon investigators in India, is the desirability of subjecting anarcotine to a fresh examination, with a view of ascertaining its value, as compared with quinine, in the different types of malarial infection, and in cases where quinine has proved ineffective.

I should mention that anarcotine was originally named "narcotine" by its discoverer, Derosne, and this is the name by which it is still generally known. This designation is, however, wholly inappropriate and misleading. The extensive trials made with this substance in India show that, in a pure state, it is quite devoid of narcotic properties. For this reason Dr. Palmer renamed it anarcotine. Dr. Garden adopted this suggestion, and I think it desirable to follow his example. I show you here two fine samples of anarcotine: one was manufactured in London by Hopkin and Williams, of 16, Cross Street, Hatton Garden; the other was procured by Dr. Vaughan Harley from India, where considerable unused stores of anarcotine still exist in medical depôts.

[Drs. NUSSEERWANJI SURVEYOR and VAUGHAN HARLEY, who have tested anarcotine from the Government Opium Factory, Patna, find it perfectly insoluble and tasteless. Small doses produced no effect; 1 gramme caused vomiting in three out of four dogs. 0.5 gramme in 1 case out of 2. When added to diet in quantities of 0.3 to 0.5 grammes it had no effect on temperature, respiration, or pulse; there was some slight increase in the water, in the faeces, and also in nitrogen unabsorbed. This led to a loss of weight, which was immediately regained on stopping the drug. Anarcotine chloride (by dissolving anarcotine in dilute HCl, drying and redissolving the chloride in chloroform, addition of ether caused precipitation of crystals of anarcotine chloride), is very soluble, with an intensely bitter taste. One-gramme dose in 3 dogs *per os* caused no vomiting; in 5 dogs subcutaneous injection caused no vomiting or perceptible alterations in temperature. Anarcotine chloride was given subcutaneously to dogs under ether to investigate blood pressure, rate of pulse, and respiration. Repeated doses of 0.3 to 0.5 gramme in 2 dogs caused no perceptible alteration in blood pressure or respiration. In 1 dog doses up to 4 grammes subcutaneously produced no effect on blood pressure or respiration, and no signs of poisoning. The intense bitter taste would seem to indicate the drug as bitter tonic; its effects on leucocytes are now being examined.]

A DISCUSSION ON SERUM THERAPEUTICS.

L.—E. KLEIN, M.D., F.R.S.,

Lecturer on General Anatomy and Physiology, St. Bartholomew's Hospital Medical College.

THE NATURE OF ANTITOXIN.

THE results of the injection of blood serum of animals, artificially immunised against diphtheria, into human beings during an attack of diphtheria, which have been achieved by Behring and his co-workers in the hospitals of Berlin and other places in Germany, and by Roux and Martin in Paris, were brought prominently before the International Congress of Hygiene, held at Buda-Pesth in September, 1894. Those who have read the accounts on this subject by Behring and by Roux,¹ and the more recent publications in this country and abroad on the value of antitoxin therapeutics in man, must have been struck by the overwhelmingly favourable results. With your permission, I will give a brief account of the scientific basis, leaving my friend Dr. Washbourn to deal with the clinical aspects of this subject. At the outset I wish to state that from a scientific point of view the value of antitoxic serum is experimentally so well founded and so easily confirmed that it would be little short of astounding if also in the human subject it did not affirm itself satisfactorily.

One of the oldest deductions that have been made by physicians and laymen alike as to infectious diseases was this, that a first attack confers a certain immunity against a second attack. Modern pathology distinguishes the condition of insusceptibility after a first attack as acquired immunity from natural insusceptibility observed in certain individuals or in certain species of animals against any one kind of infectious disorders. But only within recent years has it become possible to discuss these various conditions by means of direct experiment, and thus to lift them out of the barren region of academical discussion—a condition such as obtained previous to experimental investigation. One series of experimental work was carried out by Metchnikoff and his school, another by a series of observers of whom Buchner may be mentioned as the chief representative. The former of these schools ascribed immunity in general to the mechanical action of the cells—the leucocytes in particular—that is to say, to the capability of leucocytes to embody, digest, destroy and neutralise the infective agent or agents, and thus to prevent infection by hindering these latter from growing and multiplying in the body. Metchnikoff, in a considerable number of papers, lectures, and books published during the last ten or twelve years, has with great perseverance and with indefatigable zeal described very minutely the details of this process of "phagocytosis" in every kind of immunity. Numerous facts and observations are recorded by him and his pupils, of which the ultimate object is to prove that in natural, as also in every kind of artificial and acquired, immunity, phagocytosis is the essential factor.

The other series of observers, however, while admitting phagocytosis, that is the presence of the bacteria in cells, do not ascribe to it, for the establishment of either natural or acquired immunity, that first place which the other school does; phagocytosis, they say, is observable in many cases and under many conditions, that is to say the presence of the infective agents (bacteria) in, and their inclusion by leucocytes is seen in cases of natural immunity, for example, at or near the seat of infection or introduction of the agents (local leucocytes), and further in the leucocytosis of the blood or spleen or other parts, but it is likewise seen in cases where there is no immunity, but on the contrary a great and rapid multiplication of the specific bacteria within the body, that is a general infection with a fatal termination. Therefore, they say, the presence of bacteria in cells does not necessarily mean an attempt at producing immunity. On the other hand it can be shown they say, that phagocytosis is not necessarily present in immunity, because the infective agents in some instances are weakened and even destroyed before any phagocytosis occurs. I do not wish to enter here into the details of the lengthy and voluminous controversy that has been carried on now for nearly ten years as to the part that the cells play in the production of immunity. The number of papers written on this subject and the number

¹ *Annales de l'Institut Pasteur*, viii, No 9, p. 601.

of observations recorded *pro* and *contra* (by both sides), are far too large to do more than merely to refer to them in a general way; besides there is no necessity of doing more for the object that we have before us as will presently appear. This much, however, may be said, that through the recent observations we have gained a better understanding of the intimate and complex processes of infection than was possible previously; further, we have learnt more accurately that natural or spontaneous immunity is most probably due to an altogether different process or processes than acquired immunity, and lastly that the condition of acquired immunity is intimately bound up with the presence in the blood and tissue juices of substances comporting themselves like chemical, that is non-organised bodies which for lack of a better name are termed "antibodies." It is with particular reference to the action of these that I propose here to say a few words, which, I hasten to add, will be chiefly concerned with the scientific aspect of the question.

The view that the condition of acquired resistance and acquired immunity is due to specific substances present in the blood and tissue juices is not quite a new one—it has been expressed in a variety of ways in former years; but what is new, however, is the experimental proof that such antibodies do exist in the blood of an animal that has been artificially immunised, as also in the blood of human beings that have acquired immunity by having passed previously through an attack of the disease.

The experimental researches of Behring and Kitasato on tetanus¹ and of Behring² on diphtheria leave no doubt that by repeated injections of animals with small and at first weakened but gradually increasing and non-virulent doses of either the living culture or the specific toxins (tetanus toxin or diphtheria toxin respectively) a state of gradually increasing resistance is acquired by these animals against these diseases and that this resistance is proportionate to the amount of antecedent injections; further, that as the resistance increases the blood attains an immunising power in increasing proportion, not only as regards the subject from which the blood is derived but also as regards a new subject; that is to say that the formation and presence of these antibodies become not only increasingly marked in the animal which is being immunised but if injected into a fresh animal they are capable of furnishing this latter with a proportionate degree of resistance against subsequent infection. Lastly, they have shown that the immunising power of such blood serum comes into action even after infection has already taken place, that is the blood serum has a therapeutic action. There are briefly the principal results of these researches. The large amount of work that has already been done on these lines with respect to diphtheria, tetanus, erysipelas, abrin, mian, and snake poisoning, and the short time at my disposal do not permit of my entering as fully as I should wish into the details of this work, and at the risk of being considered fragmentary I will restrict my remarks to a brief account of the diphtheria work only, merely adding that the principles involved in this are practically the same as in the work on tetanus. Before proceeding further I will allude to a few experiments to illustrate these fundamental propositions as far as they refer to diphtheria.

EFFECT OF FATAL DOSE ON GUINEA-PIG.

(a) A guinea pig is injected subcutaneously with a definite quantity of a broth culture, or an agar or gelatine culture of the typical diphtheria bacillus; the animal shows before twenty-four hours are over a conspicuous swelling about the seat of inoculation, and dies in from thirty to forty-eight hours; on *post mortem* examination there is found hæmorrhagic œdema about the seat of inoculation, and the internal organs are much congested. Of a broth culture, made of the typical diphtheria bacillus, and incubated for forty-eight hours at 37° C., 0.25 to 0.8 c.c.m. kills, as a rule, a guinea-pig of 300 to 400 grammes weight in thirty-six hours; of a gelatine culture eight to twelve days grown at 21° C., one eighth to one tenth of a culture is sufficient to produce the same result; of pure diphtheria toxin prepared after Roux,³ 0.1 c.c.m. does the same.

EFFECT OF NON-FATAL DOSE.

(b) An animal is injected with a non-fatal dose of diphtheria culture or of diphtheria toxin. According to the different species of animals, great differences exist in respect of the reaction towards the diphtheria culture, as also the pure diphtheria toxin. A guinea-pig, being highly susceptible, lends itself less suitably to this than the less susceptible sheep or goat (Behring), and these less than the less susceptible horse (Roux). But in all these animals it is possible to so use the diphtheria culture or the diphtheria toxin that no fatal effect follows. And according to the greater or lesser initial susceptibility, both the virulence, as also the quantity of the immunising material, has to be altered.

Experience has shown that it is not difficult to so weaken, either by chemical means or by application of heat or by other methods, the diphtheria cultures or the diphtheria toxin that the first and subsequent injections do not produce more than a temporary local tumour with a temporary constitutional disturbance, and the animal recovers after the lapse of a few days. After the preliminary injections, the virulence and the dose can be increased without producing other than the temporary reaction. In this, also, differences exist as regards the different species of animals, and even between animals of the same species; suffice it to say, that after a number of injections the animal shows an increasing lack of reaction or increasing resistance to each injection, and consequently the relative and absolute amount of poison to be injected has to be gradually increased. If the blood of such animals be tested, it will be found that its power to neutralise a definite dose of diphtheria culture or diphtheria toxin for a normal control guinea-pig is proportionate, *calculus paribus*, to the number of immunising injections that have been performed on the blood giver. In other words, the greater the degree of acquired resistance in an animal, the higher the power of its blood to neutralise the diphtheria poison; or, differently expressed, the greater the acquired resistance, the greater the amount of scientific antibodies circulating in its blood. It is further justifiable to conclude from this that it is the presence of the specific antibodies in the blood which causes the resistance.

Of the blood of an animal thus furnished with an acquired resistance against the diphtheria poison, some is then withdrawn, allowed to clot, and the serum is used for the following experiments.

EFFECT OF SERUM ON TOXIN.

(c) A series of guinea-pigs of about 300 grammes each are chosen. No. 1 receives subcutaneous only a tenfold fatal dose of diphtheria toxin—that is to say, a dose sufficient to produce a marked tumour and fatal issue in thirty-six hours in ten guinea-pigs. The others each receive by subcutaneous injection a mixture of varying quantities of the serum derived from a given animal (or, as the case may be, of the same quantity of serum derived from different animals in different stages of immunisation) with the tenfold fatal dose of toxin. A serum, of which 0.1 c.c.m. is capable of completely neutralising for a guinea-pig of 300 grammes weight a tenfold fatal dose of pure diphtheria toxin, is possessed of 1 immunising unit—that is to say, 0.1 c.c.m. of the serum mixed with the tenfold fatal toxin dose, and then injected into a guinea-pig of 300 grammes weight not only leaves the animals alive, but presents not even the appearance of a tumour about the seat of inoculation; and according to the results obtained the potency of the serum can readily be ascertained. Now Behring succeeded in immunising animals to so high a degree against diphtheria that their blood serum possessed 800, 1,000, and even 1,500 units of immunising power—that is to say, 1/800 or 1/1000 or 1/1500 part respectively of 1 c.c.m. of the serum mixed with a fatal dose of diphtheria toxin and injected into a guinea-pig leaves this perfectly unharmed, whereas the control guinea-pig develops a tumour and dies in thirty-six hours after the injection of the same toxin. I venture to say that nothing can be found in the whole range of experimental pathology or pharmacology which offers clearer or more striking results than these experiments. Whether the testing of the serum on guinea-pigs is made after Behring, as above, or after Roux,⁴ or after Aronson (it is not necessary to enter into these

¹ Deutsche med. Woch., No. 50, 1890.

² Deutsche med. Woch., No. 48, 1891.

³ Archives de l'Institut Pasteur, September, 1894.

⁴ Loc. cit., September, 1894.

details here), the result is always definite, namely, an antitoxic power of the serum of animals always appears with acquired immunity, and this power stands in a direct ratio to the degree of resistance produced in the serum giver. But the serum reacts not only against the injection of the diphtheria toxin itself, that is, the metabolic products of the diphtheria bacilli, but also against the infection with living culture, that is, a true immunising or germicidal action can be demonstrated in this serum.

EFFECT OF SERUM ON LIVING BACILLI.

This has been shown by numerous experiments; I will here mention the following series:—The diphtheria bacillus can be readily grown on nutritive bouillon gelatine at 20.5° to 21.5° C.; the growth is, of course, not so rapid as on blood serum or agar at 37° C., but sufficiently pronounced after a week or ten days. In order to insure a fairly uniform result in producing infection with the bacilli of gelatine cultures, I use gelatine subcultures derived from the same stock, and removed by several generations from the original diphtheria membrane. These gelatine subcultures are made in three streaks on the sloping surface of the gelatine about 6 centimetres long; by adding to the culture a definite quantity of sterile bouillon, scraping off all the growth from the surface of the gelatine, and mixing it up so as to make a fairly uniform suspension. It is found that an amount of this suspension corresponding to $\frac{1}{2}$ of a culture is capable of producing the typical tumour and death in thirty to thirty-six hours in 1 kilogramme of guinea pigs. This result is fairly uniform; it is certainly more uniform than when ordinary broth cultures of the diphtheria bacilli are used, for in these considerable differences in virulence occur, for which no special reason can be assigned; two broth cultures derived from exactly the same stock and kept under precisely the same conditions do not possess a uniform virulence, the differences being sometimes considerable. For producing a fairly uniform infection with living bacilli, without the introduction of toxins, as is the case with broth cultures, I find gelatine subcultures, derived from the same stock and grown at 20.5° to 21.5° C. for ten to fourteen days, by far the most trustworthy.

When testing the immunising power of the serum against infection with living diphtheria bacilli, an important difference is noticed from that against pure toxin. The principle on which the antitoxic serum is prepared by Behring and by Roux is by means of the injection of animals with increasing doses of pure toxin; under these conditions of immunisation the serum attains, although slowly, to a remarkably high degree of antitoxic potency, as was mentioned above. But when testing the same serum as to its potency against the living bacilli only, without introduction of toxins, the results are somewhat different.

(a) A gelatine culture is used, of which $\frac{1}{2}$ injected subcutaneously produces in a control guinea-pig weighing 500 to 600 grammes a typical tumour and death in thirty to thirty-six hours; if the same amount of Behring's or Roux's or Aronson's serum—which, as stated above, is capable of completely neutralising a considerable fatal dose of pure toxin—is mixed with a fatal dose of living culture and injected into a guinea-pig of 500 grammes weight, it is found that it does not prevent the formation of the tumour and does not prevent death. The tumour contains the living bacilli, as subsequent culture of the material of the tumour proves. With this method of experimentation $\frac{1}{4}$ c.cm.—that is, 0.05 c.cm. of Behring's serum, of Aronson's, or of Roux's serum—does not prevent the formation of a tumour in a guinea pig of 500 grammes weight when a mixture of this amount of serum with a fatal dose of a living gelatine culture is injected, although the animal recovers; $\frac{1}{10}$ (0.01) c.cm. prevents neither the formation of the tumour nor the fatal end; 0.1 c.cm. practically prevents the formation of tumour and the animal remains well whereas a fatal dose of toxin can be neutralised by an infinitely smaller amount of that serum. So that we have here clear evidence of two different actions of the serum, namely, (a) a high antitoxic action, (b) a less powerful immunising or germicidal action; and it seems clear from this that, although the repeated injections of gradually-increasing amounts of pure toxin into the animals destined to be serum-providers have had the

result of forming in the blood a certain amount of immunising substances, these injections have led in a far higher degree to the formation of antitoxin. From this it also follows that the two processes—namely, antitoxin formation and formation of immunising substances—are not necessarily identical or even collateral.

That this is really the case can be also shown by using for the production of immunisation and for the obtaining of serum living culture instead of pure toxin. If a horse be submitted to repeated subcutaneous injections with living diphtheria cultures, at first attenuated and in small amount, but gradually of increasing virulence and increasing in amount, it will be found that just as in the case of the toxin injections the effect of each injection is followed by temporary tumour about the seat of injection and general constitutional disturbance, also of a temporary character. After some weeks—4, 6, or 8 weeks, according to the initial less or greater resistance of the horse—a serum can be obtained which has greater antitoxic and immunising power than a horse similarly prepared for the same short time with pure toxin (Cobbett). But while a continuation of the injection of increasing amounts of pure toxin materially increases the antitoxic power of the latter, a corresponding continuation of the injection of living culture does not by any means increase to the same degree the antitoxic but only the immunising or germicidal power. A series of experiments in which a comparison is made of the serum of a horse immunised with living culture with the serum of a horse prepared with toxin only illustrates this.

Thus $\frac{1}{10}$ of a c.cm. of Behring's serum, $\frac{1}{100}$ of a c.cm. of Aronson's serum, $\frac{1}{100}$ of a c.cm. of Roux's serum of highest immunity is capable of completely neutralising at least a fatal dose of toxin; that is to say, if $\frac{1}{100}$ of a c.cm. of this serum be mixed with an otherwise fatal dose of pure toxin and injected into a guinea pig, the animal remains perfectly well, and no tumour appears; the same dose of toxin kills a control guinea-pig in 30 to 36 hours; $\frac{1}{10}$ of a c.cm. of the serum of a horse immunised for 3, 4, or 6 weeks by injection of living bacilli is capable of doing this, but not more.

But on using as a test on the guinea pig not toxin, but a fatal dose of living bacilli of a gelatine culture, I find that as a general rule, of Behring's serum $\frac{1}{10}$ of a c.cm., of Aronson's $\frac{1}{10}$ of a c.cm., of Roux's $\frac{1}{10}$ of a c.cm. of a horse immunised with living bacilli, $\frac{1}{10}$ of a c.cm. or less is required to prevent the guinea-pig from dying, although now and then a swelling is nevertheless produced; from this it follows that the same immunising or germicidal action of the serum of a horse immunised by living culture is achieved in a considerably shorter space of time than in the horse immunised by toxin; and further, that the antitoxic potency of a horse treated by toxin injection is at the same time incomparably (about 50 times) higher than its immunising potency.

The high degree of resistance produced in an animal by repeated injections of pure toxin, as shown by the previous experiments, is, then, associated with the presence in that animal of antitoxin of great potency, but it need not be, and, as has been mentioned, as a matter of fact is not, associated with a high degree of immunising potency; this would suggest that the two substances are not identical. But there is more direct evidence that they have two different actions; all that is known of the diphtheria and tetanus antitoxin points strongly to its being of the nature of a ferment. Its destruction by heat (60° C. to 70° C.), its preparation from serum by Aronson by methods employed for precipitating and extracting ferments are of this character; the observation of C. Fraenkel that from a broth culture of diphtheria bacillus the toxin can by heat be readily separated from the immunising substance belongs to the same category.

A question of considerable theoretical importance is the way in which antitoxin is formed in the body. The fact that by a variety of toxins—as diphtheria and tetanus toxins, abrin, ricin, snake venom by repeated non-fatal but gradually increasing doses, animals can be furnished with a high degree of resistance, and that the blood of such animals acquires specific antitoxic powers (the statement put forward by Roux as to the antitoxic potency of diphtheria antitoxin against snake venom has been shown to be erroneous), tend to show that in the production of these specific antitoxins in the animal that had been subjected to the process

of immunisation the toxins used must be the essential factors in the process. Again, it being established that in immunisation by injection of pure diphtheria toxin, pure tetanus toxin, abrin, ricin, or snake toxin respectively, an antitoxic condition of the blood is produced, proportionate to the amount of toxin injected, it would follow that also in immunity naturally acquired against a particular infectious disease—that is, by passing through an attack or through several attacks of the disease—the resistance or immunity thus acquired is the ultimate result of the action of the toxins elaborated in the body by the growth and multiplication of the specific bacteria during the attack. But under these latter conditions it is found that, in addition to antitoxin, also a large amount of immunising or germicidal substance is created. This is well shown in the experiments of Pfeiffer⁴ on the cholera vibrio. We conclude from this, also, that the two substances, antitoxin and immunising substance, are different.

Now the question arises, Have we in the application of such serum to human diphtheria to deal with the one or the other or both actions?

IS THE REQUIRED ACTION AGAINST TOXIN OR LIVING BACILLI, OR BOTH?

Time does not permit of my entering minutely into the question of the etiological relation of the diphtheria bacilli to true or membranous diphtheria; besides, I shall have to do so in another Section of this Congress (Section of Public Health); but I will here summarise the results of an overwhelming number of observations made by competent observers in stating that the Klebs-Loeffler bacillus is the true cause of diphtheria; that the experimental evidence of this is sufficient; and, further, that the nature and effect of the specific toxins produced by the diphtheria bacilli in the culture and in the human body are the same; that, also, the appearance of post-diphtheritic paralysis producible in animals by the toxins or by injection of living culture is the same (Sidney Martin) as that occurring in man after diphtheria. The scientific basis of the application of the serum of diphtheria immunised animals in human diphtheria would be considerably weakened (for reasons stated at the introduction of this paper) were the diphtheria bacillus not the true cause of human diphtheria, but, as just briefly mentioned, a large body of positive evidence exists which enables us to say that there exists a perfectly sufficient and reliable basis for declaring the Klebs-Loeffler bacillus to be the true cause of human diphtheria. Such being the case, the application of the serum of animals, in which a high degree of resistance against diphtheria has been artificially produced either by diphtheria toxin or by living diphtheria culture, to the treatment of human diphtheria must be obvious.

CHAIN OF SYMPTOMS.

The chain of symptoms constituting true diphtheria in man is primarily caused by the growth and multiplication of the diphtheria bacilli in the affected mucous membrane (fauces, nasal mucous membrane, larynx, trachea, or bronchi, as the case may be); by this growth and multiplication certain metabolic products result (diphtheria toxins) which are absorbed into the system and give rise to the constitutional changes that characterise diphtheria; therefore the local inflammation and necrosis caused by the growth and multiplication of the diphtheria bacilli is one thing, and the absorption and action of their toxins in the body generally is another thing. Now, if it can be shown—and I think this has been amply and strikingly done—that the serum of diphtheria-immunised animals is capable of neutralising the diphtheria toxins, and is also capable of counteracting the growth and multiplication of the diphtheria bacilli themselves, a firm scientific basis has been given which should, and I think does, enable and justify us to apply therapeutically such serum; the higher the antitoxic and immunising power of such serum—as tested on the animal—the more reason there is for saying that also in diphtheria in the human subject the neutralisation of the toxin already circulating in the affected body, and the further multiplication of the diphtheria bacilli in the diphtheritically affected mucous membranes will be

more effectually neutralised and stopped; that is, the disease will be brought to a standstill, and a cure will be effected.

PROTECTIVE ACTION.

One further property that the serum of diphtheria-immunised animals possesses is that it is capable on injection into other animals of furnishing these with a resistance against a subsequent infection with the diphtheria bacilli. This protective action is, unfortunately, not of long duration, nor, for the matter of that, is the resistance produced by a first moderately severe attack. Guinea-pigs that have been injected with a non-fatal dose of living bacilli, and which developed a marked local tumour, leading in some cases to local necrosis and sloughing, after recovery can be infected again with positive result. Normal guinea-pigs which have received a dose of immunising serum prove themselves for a variable number of days resistant against subsequent infection with living bacilli, the period of immunity depending on the amount of serum injected. It ought, however, to be stated that the amount of serum required for this end is considerably greater than that which can neutralise a fatal dose of living bacilli and incomparably greater than that which can neutralise a fatal dose of pure toxin, injected at the same time with the serum. Thus, for instance, 1 c.c.m. of Behring's serum is required for a guinea-pig weighing 300 grammes, in order to protect the animal against a fatal dose of living bacilli injected three to seven days afterwards. But it is an experimentally established fact that the serum possesses protective power.

Now we have above indicated that it is highly probable that the serum possesses two different actions, namely (1) antitoxic, and (2) immunising action, which do not necessarily run on parallel lines, for we have seen that the serum prepared by Behring's or Roux's method (that is, by injection of pure toxin in the animals subject to immunisation) though possessed of a high antitoxic power, has a comparatively small immunising action, whereas with the serum obtained from animals subjected to immunisation by living culture the latter power is predominating; this would indicate that if serum is to be used for protective or immunising purposes only—for example, in the case of children, nurses, and attendants not affected with diphtheria, but who have been in contact with cases of diphtheria—a serum of high antitoxic power is not required; a serum of high immunising power will be more to the point. And in view of these considerations it might be possible to combine in the immunisation of animals both processes, namely, injection of pure toxin in order to produce a high antitoxic condition, and of living bacilli by which the immunising or germicidal action becomes also increased; in this way it is to be expected that a serum might be obtainable which has not only a high antitoxic power, but also to an equal degree a high immunising action.

A vast deal of work and continued observations will be required to enable us to say what the approximately exact dose of the serum of definite power, tested on the experimental animal, for a variety of degrees of virulence and for a variety of individuals is to be, both as regards its antitoxic as also its immunising action. These are points which cannot be settled in a month or a year; at present no other exact guide is available than that of the animal experiment, but this much can be said already, that the observations hitherto published justify the conclusion that the higher the antitoxic and immunising action of the serum, the more reasonably can we expect that it will exert its therapeutic effect, and the smaller the dose in which it will thus act.

It is not my object to enter here into the results of the observations on the therapeutic value of the serum in human

⁴ Messrs. Allen and Hanbury have kindly dried for me serum, by vacuum drying or by hot air drying, or by a combination of both processes; the result was a dry material which keeps its antitoxic and immunising action. When required a definite amount of it is extracted with a definite amount of water, and used for injection. This amount of water used is only a few c.c.m. One important difference between the use of original and of dried serum extract that has hitherto been noticed in the application to human cases at St. Bartholomew's Hospital is with regard to the antitoxic power; that is, a considerable percentage of cases follows after a dose that the injection of original antitoxic serum, when using the watery extract of the dried antitoxic serum, the result is, as a rule, absent; from the I conclude that the path-producing substance present in the original antitoxic serum is rendered insoluble, that is, not extractable by water, by the process of drying.

diphtheria.* Dr. Washbourn will deal specially with this point. The published accounts in this country and abroad are known and they point most strongly to the positive value of the treatment. What I wished to bring to your notice particularly is the experimental evidence which has led to the application of antidiphtheritic serum to human diphtheria. Although certain adverse criticisms have been brought forward against its use, one thing cannot, I think be gainsaid, namely, that the scientific basis for the application of antitoxic serum is as firmly founded and as thoroughly established as the use and application of any known drug.

II.—J. W. WASHBOURN, M.D., F.R.C.P.,

Physician to the London Fever Hospital; Assistant Physician to Guy's Hospital, etc.

THE discovery of serum therapeutics marks a distinct epoch in the history of medicine. During recent years rapid strides have been made in surgical therapeutics owing to the introduction of methods of treating wounds which are based upon sound scientific principles. The old empirical methods have been abandoned, and have been replaced by scientific methods, with the result that the dangers of surgical operations have been reduced to a minimum. The first step in this direction was the elucidation of the pathology of wound diseases, and, quickly following it, came the prevention of these diseases by antiseptic surgery. In medicine our knowledge of the etiology and pathology of disease has been greatly enriched during recent years by the study of physiology and bacteriology. Medical therapeutics, on the contrary, with the exception of the progress due to improved methods of diagnosis, has, until within the last year, remained almost at a standstill.

When we consider that our treatment has hitherto rested chiefly upon empiricism it is no matter for surprise that progress has been so tardy. The treatment of myxœdema must, however, be mentioned as a brilliant example of the application of scientific methods to medical therapeutics. But it was in bacterial diseases that therapeutics had made the least advance, and the introduction of tuberculin was consequently welcomed by the medical profession as likely to afford the assistance which was so much needed. The disastrous result of this treatment must be fresh in the minds of all; and it appeared to give the death blow to any hopes of curing bacterial disease in the human subject by scientific methods devised in the laboratory. It was only natural that clinical physicians should look upon further scientific methods of treatment with disfavour, and it was in a spirit of distrust and caution that the introduction of serum therapeutics was received. This, I feel, gives additional weight to the favourable opinion formed by the vast majority of clinical physicians of the value of the antitoxin treatment of diphtheria.

The failure of tuberculin was due to the fact that the experimental proof of its value rested upon insufficient evidence. The application of the treatment to the human subject was attempted before it had been proved to be efficacious in the case of animals.

The principle of serum therapeutics rests upon an entirely different basis. Careful and accurate experiments have shown that the blood serum of highly immunised animals possesses remarkable therapeutic properties. Professor Klein has already fully discussed the experimental side of the question, so that it is unnecessary for me to enter into any details. I will only say that the principle of serum therapeutics depends upon the fact that the blood serum of animals highly immunised by artificial means to any bacterial disease possesses the property of protecting other animals against the same disease, and that this protection is afforded whether the serum is administered before, simultaneously, or after the infection, provided in the latter case that the disease has not advanced too far before the protective injection is made. The principle is one that appears to be applicable to all bacterial dis-

eases, but up to the present it has been carefully and thoroughly worked out only in the case of tetanus and diphtheria. In the human subject serum therapeutics has not received an extended trial except in these two diseases, and it is to them that I shall chiefly limit my remarks.

TETANUS.

We will consider tetanus first, because, for reasons which will soon be apparent, we can dismiss the matter in a few words. The value of the remedy is the most important point to decide, and I feel that, with the evidence at present available, we are not yet in a position to arrive at a correct conclusion. There are many difficulties in the way. The disease is a rare one; only a few cases have been treated, and extensive statistics of the mortality before and after treatment are not forthcoming. In addition, no single clinical observer has recorded many cases, and conclusions derived from isolated cases collected from the journals are liable to the objection that all cases have not been recorded.

In a recent number of the *Medical Chronicle*, Dr. Kanthack has analysed the cases hitherto published. From his figures it would appear that the treatment is useless in acute cases with a short incubation period and rapid onset of spasms, while the chronic cases, with long incubation period and slow onset of spasms, often recover; but this latter class of cases frequently do well with other methods of treatment. A definite opinion cannot be formed until a much more extensive trial has been given to the remedy. It must be remembered that in tetanus there is no characteristic lesion at the spot of infection, and a diagnosis is only arrived at when the disease has far advanced; consequently treatment is commenced at a late stage, and analogy with the experiments conducted upon animals renders the prospect of success not very hopeful.

DIPHTHERIA.

In the case of diphtheria the conditions are quite different. The presence of a local lesion, in which diphtheria bacilli can be readily found, renders the diagnosis at an early stage an easy matter. The disease, too, is a common one, the clinical features well known, and statistics of mortality have been kept for many years past at a number of hospitals both at home and abroad. We are thus in a position to judge of the efficacy of any method of treatment which has been extensively tried.

The value of the antitoxin treatment has been tested in two ways: the one is the clinical method, the observation of the effect of antitoxin upon the course of the disease; and the other is the statistical method, the comparison of the mortality of a series of cases treated by antitoxin with that of similar series treated in other ways.

In order to arrive at a correct conclusion by either method, certain precautions must be taken, and it will be my duty to point out the fallacies that may arise.

Let us first consider the statistical method; and here I may say that I only propose to treat the matter from a general point of view, for I have been given to understand that the details of the statistics are to be discussed in another Section. We know that all statistics are open to fallacies if the number of cases is not sufficiently large, and if other precautions are not taken into account.

In diphtheria the age of the patient is a most important factor in determining the mortality. The statistics of the Metropolitan Asylums Board clearly demonstrate this point. Out of 4,435 patients under 5 years of age admitted into the Board hospitals between the years 1888-1894, the mortality was 49.9 per cent.; of 3,723 patients between 5 and 10 years it was 28.1 per cent.; of 1,330 patients between 10 and 15 years it was 10.8 per cent.; and of 1,972 patients between 15 and 40 years it was 4.6 per cent.; the mortality in each quinquennium between 15 and 40 being, roughly speaking, the same. It is thus obvious that in comparing statistics of mortality the age of the patients must be stated.

New methods of diagnosis may also lead to errors in statistics. The diagnosis of the cases treated by antitoxin have been verified by a bacteriological examination, while in former times this plan has usually been omitted. We must consider what effect this has upon the statistics.

A bacteriological examination enables us now to exclude from our statistics many cases of angina and croup which

* It may not be out of place to mention here that the watery extract of the dry antitoxic serum prepared by me has been used at St. Bartholomew's Hospital during June last on 10 consecutive cases of diphtheria in children, ranging in age between 2½ and 6 years. Of these 8 were tracheotomy cases and 2 were severe faucial cases. Of the 8 tracheotomy cases 4 were severe and 4 very severe, so much so that on admission they were not expected to survive the next 24 hours. All 10 cases recovered.

would formerly have been included. These cases are less severe than cases of true diphtheria, and on this account the older statistics of mortality are lower than they should be. On the other hand, a bacteriological examination sometimes enables us to recognise as diphtheria mild cases of angina which in former days would not have been included in the diphtheria statistics. I have no doubt that among hospital patients, at any rate, this class of cases is decidedly less frequent than the former class, consequently the mortality of cases in which the diagnosis has been verified by bacteriological examination should, *ceteris paribus*, be higher than that of cases in which the examination has been omitted.

Another point to consider is the varying severity of the epidemic. It is not common to meet with series of mild or severe cases occurring at irregular intervals. The only way to avoid this fallacy is to take either a large number of cases in each series, or to take a large number of series for comparison.

Since the introduction of the antitoxic treatment a large number of cases have been recorded in England, Germany, France, Austria, America, and other countries. Many of these are of but little value from the statistical point of view. Either the cases are isolated, or the age has not been noted, or previous statistics have not been recorded, or they have been rendered useless for comparison by the lack of some precaution or other. Nevertheless there remain over 3,000 cases recorded by different observers, in which the mortality has been compared with that of cases not treated, and in which careful precautions have been taken to arrive at a correct conclusion.

In every series the statistics show a lower mortality than that obtained by other methods of treatment. In many instances the decrease in mortality has been remarkable, sinking to half that which it was before.

In no instance has a physician recorded a large series of hospital patients under his own care in which a careful comparison of the statistics has been unfavourable to the antitoxic treatment.

Now, this uniform decrease of mortality, if not due to treatment, can only be explained either by the prevalence of a mild form of epidemic, or by mild cases being sent into the hospital by practitioners anxious to have the remedy tried. Neither explanation will hold water. In Roux's series, for instance, the epidemic was not a mild one, for the mortality at the Transvaal Hospital, where the remedy was not used, was up to the average. Again, in Berlin the supply of serum failed, and the mortality at once increased, again to fall when a fresh supply was obtained.

In a series of cases recorded by Drs. Goodall, Card, and myself, we did not make it known that the remedy was being used, so that no error could have arisen from mild cases being sent in. Nevertheless, the mortality sank to half the average, and to half that of a series of the same number of cases immediately preceding those under treatment.

From a careful and critical examination of the statistics hitherto published, I have no hesitation in saying that they definitely prove the vast superiority of the antitoxin treatment over any other method of treatment that has hitherto been adopted.

We will now consider what evidence is obtained by the clinical method of the efficacy of the remedy. The value of this evidence depends entirely upon the reliance we place upon the opinions formed by the individual observers. In reading the literature of the subject I have been struck by the fact that almost every observer who has had a large experience of diphtheria speaks in the highest possible terms of the value of the remedy; while criticism has come from those who have had only a slight experience of diphtheria, or little personal experience of the antitoxin treatment. I would maintain that both statistical and clinical evidence definitely prove that in antitoxin we possess the most valuable remedy that has ever been used in the treatment of diphtheria.

Having discussed the general question of the value of antitoxin, I will now speak of its effect upon the course of the disease.

EFFECT UPON THE EXUDATION.

The majority of observers are agreed that the exudation clears off more rapidly than with any other method of treat-

ment. The effect upon the exudation may not be apparent for the first day or two. During the first twenty-four hours the exudation may even increase, but as a rule it soon begins to clear, and when once the process has started it rapidly terminates. When the larynx is affected, the rapid clearing of the exudation frequently prevents the necessity of performing tracheotomy.

EFFECT UPON THE TEMPERATURE.

The temperature in diphtheria, apart from complications, is not of great importance as indicating the severity of the attack; consequently the effect produced by antitoxin upon the temperature is not of great moment. My own experience would show that if the temperature is much raised the injection of antitoxin causes it to fall, but when the pyrexia is moderate no marked immediate effect is produced.

EFFECT UPON THE HEART.

Antitoxin does not appear to have any direct effect upon the heart. With the general improvement in the patient's condition the pulse slows down and becomes regular, but this is not immediately manifest. There certainly is no reason for supposing that any deleterious effects are produced upon the heart.

EFFECT UPON THE KIDNEYS.

The vast majority of observers give a very definite opinion that antitoxin produces no effects upon the kidneys. It has, however, been stated by some that nephritis and suppression of urine are directly caused by the remedy. This statement is so important that it requires careful consideration.

It must be remembered that death from diphtheria is often preceded by abundant albuminuria and by scantiness or suppression of urine. Other symptoms are usually present, especially those of cardiac failure; and it is extremely difficult to say whether the patient is dying through the heart or the kidneys. Both the effect upon the heart and that upon the kidneys are no doubt caused by the diphtheria toxin, and such cases should be more correctly described as deaths from the direct toxic effects of the disease.

Under the antitoxin treatment similar symptoms may precede death; but the opinion of those who have had a large experience is decidedly opposed to the view that the symptoms are in any way brought about by the treatment.

When antitoxin has been injected into healthy individuals as a preventive measure, or has been used for the treatment of non-diphtherial cases, albuminuria is not produced, showing that the remedy has no effect upon the healthy kidney. A single case of nephritis after a preventive injection has been recorded, but I cannot help thinking that this was an accidental coincidence.

EFFECTS ON PARALYSIS.

Before we can arrive at a conclusion as to the effect of the antitoxin treatment upon the occurrence of paralysis more extended observations are required. In this connection we must not forget that the more severe the attack of diphtheria the more likely is paralysis to supervene. Many fatal cases would probably have developed paralysis had they recovered. Consequently when the mortality is lowered by treatment the actual number of cases of paralysis may increase through this cause alone.

ASSOCIATED CONDITIONS NOT AFFECTED BY ANTITOXIN.

There are certain conditions in diphtheria which are not affected by the antitoxin treatment. In many cases the exudation is invaded by various putrefactive bacteria which produce substances of a poisonous nature. The absorption of these substances increases the severity of the attack. Antitoxin has no influence upon these bacteria, and this complication can only be combated by the local application of antiseptics.

Again, a secondary invasion of the throat by streptococci not infrequently occurs, and may occasion a general septicæmia or localised inflammation in other parts of the body, especially in the lungs. This condition is also not affected by antitoxin. It is not always easy to tell from clinical observation when such a secondary invasion has taken place. According to Roux, Martin, and Chailion, a bacteriological examination of the exudation gives valuable indications. The

observations of Drs. Goodall, Card, and myself do not support this view. The question requires careful consideration, for it is exceedingly probable that this associated condition will, in the future, be successfully treated by means of a streptococcus serum.

ANTITOXIN RASHES, JOINT PAINS, ETC.

The injection of antitoxin frequently gives rise to the production of an eruption and sometimes to pain in the neighbourhood of the joints. These conditions do not make their appearance until some days after the injection. They usually occur a week after the first injection but may be delayed for as long as three weeks.

The eruption varies in its character. It is generally erythematous or urticarial and may be uniformly distributed over the body or may affect only certain parts, especially the extensor surface of the limbs. The erythema may be maculated or uniform.

Purpura has been observed in a few instances but it is possible that some of the recorded cases were those of hemorrhagic diphtheria. The eruption is often accompanied by pyrexia, the temperature sometimes reaching as high as 104° F.

Joint pains are less common. The structures around the joints appear more affected than the joints themselves. Actual effusion into the joint may however occur. The hips, wrists, and ankles are most frequently affected. Pyrexia and the eruption above described generally accompany the joint pains.

These complications clear up after a few days and no serious result has been recorded. Nevertheless they certainly retard convalescence and an effort should be made to prepare a serum which does not produce these effects. I am the more hopeful that this object will be ultimately attained because experience has shown that certain samples of antitoxin more frequently produce these symptoms than do others. It is probable that the symptoms are caused by some other body in the serum than the specific therapeutic substance. At any rate I have seen similar symptoms produced after the injection of tetanus antitoxin.

DOSAGE AND ADMINISTRATION OF ANTITOXIN.

Antitoxin is administered by subcutaneous injection. Great care should be taken to perform the injection with strict aseptic precautions. The skin should be carefully washed with soap and water, and subsequently with 1 in 20 carbolic lotion. The syringe should be boiled immediately before use. In the choice of a syringe, it is necessary to select one which can be boiled without damage. The piston should be made of asbestos or india-rubber, and all the joints made tight by washers of the same substances; no cement of any kind should be used in the joints. If care is not taken, septic troubles may arise.

In a few instances, abscesses have been recorded after injection, and these may be due to two causes: either the injection has not been performed with proper precaution, or the serum has been previously contaminated. The latter can only be avoided by using serum from a thoroughly reliable source, and by taking care not to use serum from a bottle that has been left open, and exposed to the air.

The most suitable place for injection is the subcutaneous tissue of the flank. The injection should be made as soon as the disease is diagnosed; for the earlier the treatment is commenced, the better the chance of recovery. The quantity used must depend upon the severity of the case, the strength of the antitoxin, and the age of the patient. A severe case requires a dose larger and more frequently repeated than a mild case. Probably an adult requires a larger dose than a child, but this point does not appear to me to be definitely settled.

As far as the strength of antitoxin is concerned, we are met with the difficulty that a uniform method of standardising is not always adopted. The testing of the serum is not an easy matter, and can only be performed by a skilled bacteriologist; but until a uniform system is adopted, it will be impossible for clinical observers to agree upon the proper dose to be employed in any individual case.

I think that every bottle of serum should have the strength stamped upon it, and the bottle marked in such a way that

its source can readily be traced. The dose of the serum supplied by the British Institute of Preventive Medicine is for severe cases 20 c.cm., followed by 10 c.cm. in twenty-four hours, and again by 10 c.cm. in another twenty-four hours. In mild cases, smaller doses are sufficient.

THE USE OF ANTITOXIN AS A PROPHYLACTIC MEASURE.

With regard to the use of antitoxin as a prophylactic measure I have but little to say. The protection afforded is not likely to be of long duration, and the chances of contracting diphtheria after exposure are not great, so that it is only in exceptional cases that a preventive injection would be required.

We have hitherto only considered serum therapeutics as applied to diphtheria and tetanus, but it will be interesting to conjecture the possibilities of the method in the cure of other diseases. There is sufficient experimental evidence to suggest that serum therapeutics will eventually be applicable to all diseases of bacterial origin. Already attempts have been made to cure pneumonia, erysipelas, and puerperal fever in the human subject, but the data do not yet justify us in pronouncing an opinion.

I have no doubt that serum therapeutics will in the future prove a most valuable method of treating not only definite specific diseases, such as anthrax and glanders, but also many secondary complications occurring in the course of the affections. For instance, in scarlet fever a secondary invasion with streptococci is the most frequent cause of death, and this complication will probably in the future be successfully treated by means of a streptococcus serum. Even in such a condition as intestinal obstruction serum therapeutics will be an important aid in treatment, for it cannot be doubted that the chief danger arises from the absorption of various bacterial products.

The experiments recently made with snake poisons give every hope of a successful treatment of snake bites in the near future. In conclusion, I will say that serum therapeutics opens out an entirely new field in the treatment of disease, and I believe it will be to medicine what the antiseptic treatment has been to surgery, and that we shall soon be in a position to cure many diseases which have hitherto resisted all our methods of treatment.

III.—M. CHARTERIS, M.D., F.F.P.S. Glasg.,

Professor of Materia Medica and Therapeutics, University of Glasgow. I HAD opportunities of observing, during last winter, cases of diphtheria at Belvidere Hospital, which were treated by antitoxin. There seemed to me to be no doubt about its efficacy. The patches of membrane ceased to spread, and shrivelled up after the injections. The ashy colour of the face was replaced by a healthy hue, and the pulse became fuller and stronger.

I was so much impressed with what I had seen that I resolved to institute an experimental research with regard to the different specimens of antitoxin in the market. I obtained permission from the Home Office without any objection being raised, and subsequently received from Germany a sample of diphtheria toxin by the aid of which the antitoxin is prepared. This toxin, in a dose of 0.55 c.cm., kills a guinea-pig weighing from 250 to 300 g. in two days. I tested this sample on a guinea-pig weighing 450 g., using a dose proportionate to its weight. Death resulted in two days, being preceded by paralysis of the hind legs.

Such a toxine must be employed if one is to obtain a serum rich in antitoxin. The antitoxic serum is tested under the control of the German Government in the following manner: An official withdraws a sample from about five litres of the serum, and examines it for (1) sterility, and (2) strength.

The test of the antitoxin strength is carried out as follows: 4 c.cm. of a solution diluted to 1 to 4,000 is mixed with a dose of diphtheritic poison, which is ten times the minimum lethal dose for a guinea pig of about 250 g. weight. Into such animals the mixture is injected, and should produce neither loss in weight nor local infiltration. This method of examination when carried out under uniform conditions, gives most reliable results. One c.cm. must contain 100 immunity units.

Acting on this information I resolved:

1. To determine if the different antitoxins commonly sold in this country had any action on healthy guinea-pigs. 1 obtained samples of:

- A. Aronson's antitoxin.
- B. Behring's No. 2.
- C. Burroughs and Wellcome's.
- D. British Institute of Preventive Medicine.

On the same day injections were made of the different samples under strict antiseptic conditions. In each case the dose for a child of 20 pounds was divided by 20, so that of the British Institute of Preventive Medicine and of Burroughs, Wellcome and Co. 1 c.cm. in each case was injected, while of Aronson's $\frac{1}{2}$ c.cm., and of Behring's $\frac{1}{2}$ c.cm. were used. None of the antitoxins were found to produce ill effects, either local or general.

2. I next proceeded to test their efficacy in counteracting toxin. The four samples were diluted to 1 to 4,000 by weight.

3. The guinea-pigs experimented on weighed from 500 g. to 700 g.; 15 c.cm. of the toxin in each case were injected with the diluted antitoxin solution in the following proportions:

- A. 15 c.cm. toxin plus 9 c.cm. of Aronson's antitoxin.
- B. 15 c.cm. toxin plus 15 c.cm. of Behring's.
- C. 15 c.cm. toxin plus 40 c.cm. of Burroughs and Wellcome's.
- D. 15 c.cm. toxin plus 60 c.cm. British Institute of Preventive Medicine.

The larger dose of the two latter antitoxins necessitated injections into both sides of the abdominal walls of the two pigs employed. On the following day all the pigs were huddled together, and took no food. At the sites of the injections in the pigs 3 and 4 there was evidence of infiltration, but in pigs 1 and 2 this was not observed. Hardening followed the infiltration, and continued for thirteen days, but appeared to occasion no discomfort nor any impairment of health.

IV.—R. T. HEWLETT, M.D. Lond., British Institute of Preventive Medicine.

BEHRING and Kitasato, experimenting with diphtheria and tetanus, announced at the end of 1890 that the blood of a rabbit rendered refractory to tetanus was capable of neutralising the toxins of tetanus. [The speaker then gave a brief outline of the methods employed by Behring, Roux and Vaillard, and himself in obtaining tetanus antitoxin. He pointed out that the antitoxin issued by Tizzoni differed from the others in that it was obtained by precipitation of the serum by means of alcohol; in the other cases the serum was issued either in the usual liquid form, or was reduced to a solid by being dried *in vacuo* over sulphuric acid. All these antitoxins possessed a very high immunising power; this should never be less than 1 to 1,000,000, and Roux had succeeded in getting it much more powerful still.]

STATISTICS.

Although relatively infrequent, tetanus causes a not inconsiderable number of deaths in the British Isles, and in some tropical countries is a serious cause of mortality, notably in some parts of India and in some of the West Indian islands.

MORTALITY.

Although it is very difficult to arrive at an accurate idea of the proportion of cases which pass to a fatal issue, I have, by a careful comparison of the statistics from various sources, come to the conclusion that the mortality may be stated at somewhere about 75 per cent. Now as to the antitoxin treatment, I have collected statistics of 61 cases treated with antitoxin, with 22 deaths, giving a mortality of only 36 per cent. There are, however, several fallacies to be guarded against. There is always a tendency to publish successful cases only. Although it is stated that the Italians have suppressed fatal cases I do not think this source of error would materially influence the result, for, being a new treatment, it is probable that the greater number of cases have been published. There are, however, other fallacies, notably (1) that a favourable result was independent of the antitoxin treatment, and (2) that a number of chronic cases, which tend to recover under the old treatment, make up the apparent successes. Dr. Kanthack, from a valuable critical survey of 54 of the published cases, considers that the two latter are real sources of error. He comes to the conclusion

that the antitoxin is probably of little value in the acute cases with rapid progress, but that in the chronic cases it seems to be of real service, diminishing the death-rate and rendering the spasms less frequent and less severe. Vaillard, in a recent paper, comes to the same conclusion. He says that the tetanus antitoxin is powerless in the acute form, but that it may sometimes be efficacious in chronic tetanus. Kanthack, Vaillard, and myself have advocated the employment of antitoxin as a preventive. This should be of special use in tropical countries and also in veterinary practice, where tetanus is far more common than in ordinary medical practice.

V.—NESTOR TIRARD, M.D., F.R.C.P.,

Professor of Materia Medica and Therapeutics in King's College; Senior Physician to the Evelina Hospital, Southwark.

THE speaker gave his experience at the Evelina Hospital in the treatment of diphtheria by Behring's antitoxin. He first spoke of the high rate of mortality which had preceded his employment of antitoxin, and then reviewed the results obtained more recently. He stated that the good effects noted had reference to the pulse, temperature, nervous system, and the diphtheritic membranes. The pulse gained strength and in some cases diminished in rate; the temperature either fell or remained the same—in no case did it rise; the nervous system gained in tone, and the membrane speedily diminished and did not form again. With regard to ill-effects, it was found that albumen was found in the urine in many cases, but this was also often noticed before the antitoxin had been used at all, and it was unaccompanied by any symptoms referable to interference with renal function. A rash had been noted in three cases, and it was suggested that it might be due to some alteration in the serum employed; the rash was always of the nature of an urticaria, and gave no trouble. Post-diphtheritic forms of paralysis had been absent, although children had been seen at long intervals after leaving the hospital. While recognising that it was possible that the greatly diminished death-rate might be due to an unusually favourable epidemic, it was pointed out that the cases treated had been very severe in their clinical features.

VI.—W. GAYTON, M.D.,

Medical Superintendent North-Western Fever Hospital.

DR. GAYTON quoted figures, from which he drew the following deductions:

1. That the death-rates are slightly lower, although the reduction is not uniform, as it ought to be, if a single favourable factor was at work, for indeed in the youngest ages the death-rate, as before said, has been largely increased.
2. That the reduction in the death-rate may be explained equally by the generally less virulent form of the disease, as by any assumption that it is due to a change in treatment—in a word, the death-rate does not show that large, undoubted, and regular diminution that it should do if some novel and potent means of combating the poison was at work.
3. That the remedy does not diminish the tendency to complication: thus paralysis has increased from 15.5 per cent. to 20 per cent., while nephritis has either been more looked for and seen in 1895, or was uncommon or overlooked in 1894 and preceding years. Abscess in the abdominal wall had been observed in 7 cases, 1 terminating fatally, although the most rigid antiseptic precautions were taken. Rashes of many sorts, kinds, and descriptions had been in evidence at various periods from the second to the twenty-ninth day, the majority, however, on the seventh and eighth, and although said to be innocuous, nevertheless produced very frequently marked constitutional disturbances.

His own experience and that of his colleagues might be summed up thus: Those cases that under the old treatment would probably have died, still were fatal under the new. Those which might get better recovered in about the same proportion, whilst the mild cases improved no more rapidly—indeed rather the contrary, considering the frequency of the incidence of rashes, than those without it.

In conclusion, he added a few words as to the value of the bacteriological examination of the swabbing from the throat. To the practitioner who only rarely saw a case of diphtheria the value might be a maximal one, but to those who had

clinically studied the disease for long periods, and were day by day and hour by hour engaged in its treatment, the value was a minimal one, and from extended experience very negative. In very few cases, in fact he might say hardly any, admitted to the hospital and pronounced to be diseases other than diphtheria, had bacilli been found, whereas in case after case which clinically had been decided by us to be diphtheria the bacteriological report had stated that the bacillus was absent. This only, however, meant that the bacillus was not found in that particular specimen, and not that the disease was not in existence, as was evidenced by the facts present at the time, and the results that ensued, complications and clinical facts proving incontestably that the bedside diagnosis and not the bacteriological test was the correct one. Although in the statistics submitted all the latter cases were omitted, they tended to lower the value of the remedy, instead of increasing it, as was expected and most earnestly desired.

VII.—FOORD CAIGER, M.D.,

Medical Superintendent South-Western Fever Hospital.

THE few remarks which it is my privilege to contribute to this discussion are entirely of a clinical nature, and are concerned solely with the antitoxin treatment of diphtheria, because it is in that field alone that I can lay claim to any practical experience.

Having treated all the severe cases of diphtheria which have come under my care during the past eight months with antitoxic serum, to the number of more than 230, I am able to point in general terms to the following benefits which my experience up to the present justifies me in placing to the credit of the remedy:

1. It leads to a more rapid separation of the diphtheritic exudation. As a consequence of this not only is the patient's distress greatly lessened, but the chance of later paralysis, including that dread complication cardiac failure, which is the direct effect of the virus, is thereby considerably reduced. It has been stated by some observers that the incidence of paralysis is increased by the antitoxin treatment. In answer it may be justly contended that a certain number of those cases of paralysis which do occur are accounted for by the fact that the patients live to present the phenomena of paralysis, instead of dying at an earlier stage of their illness from cardiac failure; for if there is one clinical fact about diphtheria which is beyond dispute it is that the chance of a person developing paralysis, whether cardiac or peripheral, is in direct ratio with the extent and persistence of the exudation. If the exudation stage therefore is shortened by antitoxin, what wonder that the prognosis becomes proportionately more hopeful? The superficial extent of an exudation exerts a like influence upon the prognosis as does its duration, because a proportionately larger amount of toxin is manufactured and offered for absorption, and the spread and reformation of the membrane is in most cases curtailed by antitoxin. During the first six months of 1895—a time when all severe cases were treated with serum—the average duration of membrane in the diphtheria cases after admission into the South-Western Fever Hospital was two to six days, whereas during the corresponding period of 1894, before antitoxin was used, it was four to six days.

2. Another symptom which seems to be directly controlled by antitoxin is rhinorrhoea. That profuse, acid, sero-purulent discharge from the nose, which is such a marked feature of the naso-facial attack, is frequently almost entirely checked after twenty-four to forty-eight hours' treatment with the serum, and the relief from distress which the patient experiences after the patency of his nasal passages has been restored to him is most striking.

3. The most marked benefit which we find to attend the use of antitoxin is seen in the relief of laryngeal obstruction. It would seem that not only does the membrane loosen more rapidly, but the swelling and secretion of the laryngeal mucous membrane quickly subside as well, and further tend to relieve the stridor. The effect of using antitoxin has been to reduce very considerably the number of tracheotomies; but here the paramount importance of commencing treatment at an early date is obvious. Many cases are admitted in which the dyspnoea is too urgent to wait for the effect of antitoxin, and

the operation has to be undertaken without delay. Such cases provide a greatly improved field for the practice of intubation, if this procedure be preferred to tracheotomy. Of 117 consecutive cases of croup admitted under my care since the beginning of last year, those who came in before antitoxin was being used required tracheotomy to the number of 70 per cent., whereas only 43 per cent. required tracheotomy amongst those who were admitted after November, at which time the serum treatment was commenced.

4. The mortality of the disease is lessened. I should like to have been able to produce to-day statistical evidence dealing with the results which have been obtained in those cases of diphtheria which my colleagues and I have treated with antitoxin. However, the results obtained at the Stockwell Fever Hospital will have their place in a joint report to be drawn up by the medical superintendents of the Asylums Board Hospitals, and presented to the managers for publication after the remedy has been tried for a full year in the institutions under their control. It is in deference to the expressed wish of the Board that I have refrained from anticipating this report by the publication of any mortality statistics which might be regarded as of an incomplete or partial character. For the present, therefore, I fear that I must content myself with the simple statement that in my opinion the remedy has exerted an influence for the better upon the diphtheria mortality.

5. Not only so, but in cases which were destined to die the remedy has distinctly prolonged life, and in many cases relieved to a considerable extent the distress which so commonly obtains in a fatal attack. Of cases fatal during the first six months of 1894 the average duration of life after admission to hospital was 4.3 days, whereas during the corresponding period of 1895—the serum period—it was prolonged to 7.2 days. This at any rate would seem to indicate that antitoxic serum is not a virulent poison.

So much then for the most obvious benefits which, in the opinion of myself and colleagues, have accrued from the use of antitoxin. All the cases were treated with the serum supplied by the British Institute of Preventive Medicine, which is prepared by the method of M. Roux. Of that prepared by, or after the method of, Dr. Klein, I regret to say that I have as yet had no experience. One other case, however, was treated, with excellent results, with serum prepared by Dr. Cobbett in the Cambridge Laboratory, and which he was kind enough to send me.

There is no doubt that much depends upon the dosage employed, and it is much to be regretted that we have at present practically no knowledge of the amount which will best serve the purpose. It is easy enough to gauge with accuracy the amount of serum which is required to neutralise a known amount of virus when injected into a guinea-pig of known weight. We have no knowledge, however, of the quantity of virus which is circulating in the system of a human being suffering from diphtheria, and it is therefore quite impossible to estimate with any measure of confidence the amount of antitoxic serum required for its complete neutralisation.

At the Stockwell Hospital we originally used what may be regarded as the orthodox amount of the serum as supplied by the Institute, namely, from 40 c.cm. to 60 c.cm. per case, given in doses of 10 c.cm. to 20 c.cm. at intervals of twenty-four hours. During the last seven or eight weeks, however, we have been employing a much larger dosage in severe cases, namely, from 150 c.cm. to 200 c.cm. of serum, given in injections of 20 c.cm. frequently repeated during the first three days after the case has come under treatment. The remedy is then stopped altogether. So far the results have been more satisfactory, and no harm has resulted in other respects. Much discredit has fallen on the antitoxic treatment owing to its employment by some practitioners in totally inadequate doses.

Now as to the ill effects of the treatment, and in view of the hostile criticism to which the antitoxic method is subjected, the greatest care is necessary to record them accurately and to avoid minimising in any degree their importance. I fully recognise the following:

1. *Eanescent Rashes*.—These are often described under the generic term urticaria. Many of them are truly urticarial, but others certainly are not. They may be classified under

four heads: (1) True urticaria, consisting of raised white wheals. (2) A morbilliform eruption mostly invading the limbs, consisting of raised red spots, which often coalesce and give rise to extensive tracts of angry-looking skin. This form is more persistent than the former, and sometimes leads to purpuric staining. It rarely itches, but varies in the intensity of its colour at different times in the day. (3) Raised red spots or blotches, very like the last, but with a central white portion, which gives rise to the appearance of red rings—in reality a form of erythema circinatum. (4) A scarlatiniform flush, often extensive, and very likely to be mistaken for concurrent scarlet fever. A powdery desquamation often follows, but never shows the pinhole conformation. This form is usually seen at an earlier stage than the others. These eruptions are very frequent; they usually appear from the seventh to the tenth day after the first inoculation, and often recur.

2. *Short Spells of Pyrexia.*—In many cases the rise of temperature is associated with one of the eruptions before described. In others it is apparently dependent upon some degree of arthritis. In perhaps the majority the pyrexia is, as far as can be ascertained, unattended with any definite complication. The fever is of an irregular character, showing considerable fluctuations. It usually appears at some time during the first two weeks of convalescence, lasts from three to eight days, and disappears without leaving anything worse behind than a slight degree of pallor and debility. There is no apparent connection with albuminuria, but in some cases it coincides with the advent of some variety of diphtheritic paralysis.

3. *Abcess.*—This usually occurs at the seat of inoculation. It is very uncommon, in our experience occurring but ten times in over 1,000 inoculations. Dr. Washbourn suggests that it is always due to one of two causes, namely, a local sepsis conveyed by the syringe or a contamination of the serum after it has been bottled, possibly occurring when the bottle has been opened in the ward, and not at once used up. I would suggest a third possibility—namely, that it arises as the result of a completely aseptic operation, performed upon a person who is in a condition of septicæmia dependent upon the septic lesion in the throat. This explanation fully harmonises with the fact that it is possible to produce an abscess over the skin of an animal as the result of a simple blow, provided that that animal has previously been inoculated with some septic material. Idiocy, too, may not be without its influence, as evidenced by a special vulnerability of tissue. Anyhow, in spite of every precaution, an abscess will occasionally develop; and in view of the fact that I have observed several to occur at about the same time, I am under the impression that the cause may be referable to some property possessed by the serum of a particular horse. It is to be regretted that each bottle of serum is not marked in such a way as to enable one to trace its source to the animal which furnished it. Recovery followed in each case of abscess which I have observed.

4. *Arthritis.*—This complication is very uncommon; 13 cases only occurred amongst the 260 patients treated. In only 2 of these was obvious effusion to be detected. One of them, however, was severe, but the majority might be more fully described as cases of joint pain rather than of arthritis. The complication may arise at any time during the first three weeks, and is almost always pyrexial. Recovery in all cases ensued.

Now, recognising, as one must, that the above ill effects are the direct result of the antitoxic inoculation, it is impossible to exercise too much care in the preparation and storage of the serum, and as these effects are without doubt dependent upon some property of the fluid medium in which the antitoxin is purveyed there is every reason to hope that they may be done away with if it ever becomes possible to separate the antitoxin from the serum which contains it.

In comparing the ill effects with the good effects of the remedy, I have no hesitation in saying that they are very unimportant, but, as they furnish undoubted evidence of some abnormal pathological process going on in the body, I should not advise the irresponsible employment of antitoxin in those mild cases for which nothing more is required than local irrigation of the throat coupled with a suitable diet; but in cases of diphtheria which are at all severe, or in those

about the severity of which I were in any manner of doubt, my present decision would be to pin my faith upon antitoxin.

It has been stated, I feel sure without sufficient evidence, that antitoxic inoculations are liable to set up nephritis and suppression of urine. I can only say that we have carefully watched for these results, and that we have been altogether unable to confirm them. We have found nothing either clinically or in the *post-mortem* room in cases of diphtheria treated with antitoxin which was not also to be found in those which died before the remedy was employed. A fitting commentary on the supposed connection between antitoxin and nephritis is furnished by the case of a boy who has recently recovered from one of the most severe attacks of diphtheria that I have ever known to pull through. His case was unique by reason of the fact that he showed no trace of albumen throughout the course of his protracted illness, but he had received the largest amount of antitoxin that we have ever given, namely, 215 c.cm. in three days.

VIII.—T. R. FRASER, M.D.,

Professor of Materia Medica and Therapeutics, University of Edinburgh.

1. ALTHOUGH a new subject, serum therapeutics has already made such rapid advances that it is necessary to restrict my remarks to one or two aspects only of the subject.

2. Nothing has been better established than that the subject deals very largely with the actions of toxic substances, and especially with the means of preventing the toxic and lethal effects of such substances.

3. A fundamental matter for consideration must, therefore, be the quantity of dose of the toxic substance present in the patient, and the relationship of this dose to the antidotal power of the remedy or antitoxin.

4. The dose of toxin present in a patient, however, can never be estimated with even an approach to accuracy.

5. It has been usual to define the antidotal power of the antitoxin by ascertaining the smallest quantity required to prevent death, or to prevent certain well-marked toxic effects, when a given dose of toxin is mixed with antitoxin *in vitro*, before injection into the body.

6. This basis is likely to lead to an exaggerated opinion of the antidotal power of the antitoxin. It seems also to be an insufficient one for practical applications, for the doses required to prevent death are altogether different in the conditions of practical use from those indicated by experiments *in vitro*.

7. This method does not even indicate the quantity of antitoxin in the most favourable, and practically unattainable, condition of the unmixed toxin and antitoxin being received simultaneously by the patient. Taking merely the minimum lethal dose of toxin, the quantity of antitoxin required as an antidote when the two are injected simultaneously into separate subcutaneous areas may be more than a hundred times as great as when the two are mixed together *in vitro* before being injected. The difference is still greater when the conditions more closely resemble those encountered in practice, for if a minimum lethal dose of toxin has been received thirty minutes before the antitoxin, the dose of antitoxin required to prevent death may be two hundred times as great as the dose required when the toxin and antitoxin are mixed together before administration.

8. These relationships, further, are again altered when the dose of toxin is greater than the minimum lethal; but it is interesting to find that when the doses of toxin are so large as twice the minimum lethal, or even somewhat larger, the difference between the quantity of antitoxin required to prevent death when it is given 30 minutes after the toxin, and the quantity required when the two substances are mixed *in vitro*, is not nearly so great as when the dose of toxin is only the minimum lethal.

9. It is also of importance to note that if the dose of toxin considerably exceeds the minimum lethal, possibly for most toxins when it is so large as three the minimum lethal, there are probably no existing antitoxins that are capable of preventing death in any conditions encountered in practice.

10. Indications for practical application such as those referred to, obtained by pharmacological methods, seem to be

required for each of the toxins and antitoxins that have been discovered.

11. The brilliancy of the results already obtained by serum therapeutics, their novelty, and the apparently unbounded capacity of antitoxins to produce therapeutic antidotism, have perhaps led to a neglect of some of the most important fundamental considerations which must govern their practical application and supply the information required for justly estimating their capabilities.

12. It is perhaps, also, not sufficiently appreciated that failures must necessarily occur, for the therapeutic capability of each antitoxin has definite limitations, and, unless this be appreciated, unmerited distrust may easily be engendered.

13. In the existence of the impossibility of proving in man that any administration of antitoxin has naturally prevented death, it is important that the fundamental data I have referred to should be obtained by experiment; thereby only will confidence in practice be assured, for it will become apparent that while in a certain number of cases it is impossible to save life, it is, at the same time, possible to do so in many cases, when also, in all probability, no other remedy or combination of remedial measures would have been successful.

IX.—T. J. BOKENHAM, M.R.C.S., L.R.C.P.,

Late Research Scholar British Medical Association.

ONE of the chief objections to the application of the serum treatment of diphtheria in private practice would seem to be the large size of the injections usually advocated, and the necessarily formidable size and appearance of the syringe required for the operation. Practitioners have frequently assured me that parents, who may have consented to the use of antitoxin, not at all seldom alter their minds when they see the syringe and the bulk of liquid which it is proposed to inject. This is a real difficulty, and I have for some months past set myself to work to discover the best means available of overcoming it. This, I think, has now been done in a fairly satisfactory manner. By a process of drying, combined or not with previous concentration at a low temperature *in vacuo*, I have succeeded in reducing the serum to a condition of thin golden scales; 100 c.cm. yield on an average between 10 and 11 grammes of dry scales. These are readily soluble in about two and a half to three times their weight of water, and the activity of the solution thus made is almost identical with that of the original serum. I have heard of no ill effects following its use; it keeps perfectly, and may of course be used with a comparatively small syringe.

There is a good deal of evidence in favour of the idea that local disturbances and erythematous rashes, etc., when they occur may be in great measure due to the albuminous constituents of a serum; they may appear even after injection of normal horse serum. If, therefore, it could be shown that the activity of antitoxic serum resided in some component other than the serum albumen, and if, further, this albumen could be removed, leaving the active principle behind, two important steps would have been advanced. Some experimental observations of my own seem, if corroborated by further observation, to prove the first point, and to indicate a method of accomplishing the second. I have found that a serum practically freed from coagulable albumen is still highly antitoxic, and can be obtained fairly easily by a method which I hope to describe fully in the near future. I anticipate with confidence that an elaboration of this method will so alter the conditions of administration of sero-therapeutics as to bring it into line with ordinary hypodermic treatment with drugs. However, I do not lose sight of the fact that early experimental results are apt to be fallacious, and that the most promising ones sometimes break down when put to the test of clinical experience.

Finally, I wish to say a few words concerning the "specificity" of antitoxic serums. Abundant observations demonstrate that, although a given serum—say, the antidiphtheritic—has a most marked protective or curative action on cases infected with the corresponding microbe, yet its immunising action is not entirely confined to the one affection. From personal experience I am able to state that diphtheria antitoxin has some protective action not only against the diphtheria bacillus, but also against the bacillus of typhoid and against streptococcal infection; not only this, but that a given animal,

once immunised against one bacillary enemy, resists another species of microbe far more readily than a normal control animal. Starting with this knowledge, I have for some time past been engaged in increasing the natural resistance of a single animal against more than a single infective process, and I have strong hopes of eventually obtaining by this means a serum of exalted immunising powers against each of the original microbes. Simplification in sero-therapeutics is of at least as great importance as in any other system of treatment, and to obtain a serum applicable to the treatment of not only one, but of a variety of diseases, appears to me a decided advance in the right direction.

[I have only this day ascertained from the last number of the *Annales de l'Institut Pasteur*, which has just come into my hands, that my esteemed friend, Dr. A. Marmorek, of the Paris Pasteur Institute, has been working on exactly similar lines to those I have just enunciated. I need hardly say that I was entirely ignorant of this, and I can only hope that my own results may afford an independent corroboration of any that he may obtain, or may have already accomplished.]

The discussion was closed by brief replies from Dr. KLEIN and Dr. WASHBURN.

THE TREATMENT OF SNAKE POISONING WITH ANTIVENENE DERIVED FROM ANIMALS PRO- TECTED AGAINST SERPENTS' VENOM.

By T. R. FRASER, M.D., F.R.S.,

Professor of Materia Medica and Therapeutics, University of Edinburgh.

FOR many years immunity against the toxic effects of serpents' venom has been suggested as a possibility in the tales of the performances of snake charmers, and in the widely prevailing belief that venomous serpents are protected against the venom of their own and other species of serpents.

If this immunity or protection exist, it seems reasonable to suppose that it is due to a substance or substances produced in the blood as a result of the absorption of venom, and that this substance, if present in the blood, would, when removed from it, act as an antidote against venom.

In order to test these suppositions by experiment, I had begun to collect venom more than ten years ago, but as only small quantities could from time to time be obtained, it was not until last year that a sufficient amount had been collected to justify the hope that the supply would not become exhausted before definite results had been obtained.

PROTECTION PRODUCED BY STOMACH ADMINISTRATION.

If protection is naturally possessed by snake charmers or other persons claiming to possess it, or by venomous serpents, as a result of the absorption of venom, this protection-producing venom must generally, if not invariably, have been introduced into the body through the alimentary canal. No doubt the probability of thus producing protection is opposed by the fact, recognised even at the time of Celsus, and corroborated by such modern observers as Lacerda, Weir Mitchell, Fayer and Brunton, and Calmette, that serpents' venom is altogether inert, or nearly so, when it is introduced into the stomach or any other part of the alimentary canal. Even assuming that venom so introduced is inert, or nearly so, as a poison, it does not necessarily follow that it is incapable of producing protection; for this protection is, in part at least, dependent on the presence in the blood of a substance or substances which possess no distinct toxic action, and which may therefore be present in the blood as the result of the administration of venom, even although the venom did not produce any evident poisonous symptoms.

In order to obtain some evidence on this subject, the following experiment was made on a cat. Taking as a basis the minimum lethal dose by the subcutaneous method of administration, the cat received at intervals of from two to five days one-fifth of the minimum lethal dose on eight occasions, then one-fourth, and one-third; and at longer intervals the minimum lethal twice, four times, six times, eight times, ten times, and so on, until, on the 116th day, a dose eighty times larger than the minimum lethal was introduced into the stomach. No observable disturbance was produced by any of these doses.

As in further administrations doses of upwards of a gramme of dry venom would have been required, the experiment was not continued beyond this point, for such large quantities would have soon exhausted the rapidly-diminishing supply of venom.

Eight days after the animal had received by the stomach a dose of venom representing eighty times the minimum lethal if given subcutaneously, a dose of venom corresponding to one and a half times the minimum lethal was injected under the skin. No obvious general symptoms followed the administration of this dose, but some local oedema and skin necrosis were produced, and the animal has remained in good health until the present time.

During this experiment an opportunity occurred for obtaining other facts of some interest. It happened that when the administrations of venom were commenced, the animal was already pregnant, and on the 54th day of the experiment two healthy kittens were born. These kittens were fed exclusively on the mother's milk, the mother continuing to receive gradually increasing doses of venom.

One of the kittens, when 57 days old, and when the mother had last received a dose equivalent to thirty times the minimum lethal if given subcutaneously, received, by subcutaneous injection, twice the minimum lethal dose of cobra venom; and only slight symptoms, consisting chiefly of drowsiness and loss of appetite, were produced, from which the kitten completely recovered in a few hours.

The second kitten, when 69 days old, received also by subcutaneous injection, thrice the minimum lethal dose; but the protection produced through the mother's milk was insufficient to antagonise this large dose of venom, and death followed the administration.

Evidence in favour of the protection by stomach administration, as well as of the toxic feebleness of venom when given by this channel, has been obtained with white rats also. Single doses, corresponding to 10, 20, 40, 200, 300, 600, and 1,000 times the minimum lethal if given subcutaneously, were given by stomach administration to each of seven different white rats. Sleepiness and loss of appetite, lasting for a day or two, were the only effects produced even by the larger of these enormous quantities, and all the animals entirely recovered.

A further experiment was made on the white rat which had received 1,000 times the minimum lethal dose. Seven days after this dose had been administered, and when the animal was apparently in good health, twice the minimum lethal dose was injected under the skin. Distinct, though not serious, toxic symptoms were produced, consisting of sleepiness, anorexia, and increase of salivary and bronchial secretions; but in less than twenty-four hours these symptoms had disappeared, and the animal was soon afterwards in a perfectly normal state.

It would therefore appear that although serpents' venom, even in enormous quantities, fails to produce any toxic effects when introduced into the stomach, it still confers upon the animal a certain and not inconsiderable degree of resistance against the toxic effects of subsequent lethal doses of venom. That it does so by causing an antidotal substance to be present in the blood is also manifest from the result of the experiment on the kitten, which had been fed with milk derived from a parent receiving venom by the stomach.

In circumstances which are no doubt exceptional some of these results would admit of useful practical application. They probably also offered an explanation of the protection apparently enjoyed by certain snake charmers, as well as by individuals who claim to be protected, whether members of special sects or not; for subcutaneous injection is not likely to be the method, and it certainly was not the method several hundreds of years ago, employed for the introduction of the protection-producing venom into their bodies.

ANTIDOTAL PROPERTIES OF THE BLOOD SERUM OF VENOMOUS SERPENTS.

The results of these experiments may explain also the clearly established protection possessed by venomous serpents. They, as well as other circumstances, render it important to determine whether the blood of venomous serpents contains, as does that of artificially-protected animals, an actual substance possessing antidotal qualities.

In order to arrive at some definite conclusion on this subject, I have made endeavours to obtain living venomous serpents, and also the serum separated from their blood.

Last year an arrangement was concluded with one of the best known of the importers of wild animals to supply me with living cobras. He, however, has not succeeded in doing so because of some exceptional difficulties; but, as an alternative, he has recently been able to send me several living specimens of the hamadryas (*Ophiophagus elaps*), a serpent of greater size and more aggressive disposition than the cobra, and reputed to be at least as deadly as it. A few days after their arrival it was observed that moulting was about to commence, and as the condition of health is deteriorated during this process blood has not yet been taken from any living hamadryas. One of them, however, became sickly and died. A short time after its death the neck blood vessels were opened, and as coagulation fortunately had not occurred, a small quantity of blood was collected, from which a little blood serum afterwards separated. As no liquid venom could be obtained from this hamadryas this serum has been tested against cobra venom. Two experiments were made, in which it was mixed with slightly more than the minimum lethal dose of cobra venom, and the mixture then injected under the skin of rabbit. When the quantity of hamadryas antivenene was 0.15 c.c.m. ($\frac{3}{20}$ per kilo. of animal death was not prevented; but as the animal did not die until more than seven hours an antidotal effect had apparently been produced by this quantity of antivenene.

In the second experiment a larger quantity of serum was used, namely, 0.25 c.c.m. ($\frac{1}{4}$ per kilo., and the result was entirely successful; for not only did the animal survive, but no decided symptoms of poisoning were manifested during the first six hours in which the animal remained under observation.

Two experiments were also made in which this antivenene was administered thirty minutes after rather more than the minimum lethal dose of cobra venom. In the first the dose of antivenene was 0.3 c.c.m. per kilo.; but this dose was found to be an insufficient one, for the animal died in four hours. In the second experiment 0.5 c.c.m. per kilo. of antivenene was administered on the same conditions as in the former experiment, and it proved to be a sufficient quantity, for the animal recovered after manifesting only slight toxic symptoms.

I hope by-and-by to extend these observations with blood serum and venom taken in more favourable circumstances from the other and larger hamadryas, which are now apparently in a state of excellent health.

It has, however, been already possible to confirm these results with the antivenene and venom of another specimen of serpent. Dr. Thomas Bancroft, of Brisbane, Australia, has recently sent me the dried blood serum of three black snakes (*Pseudochis porphyriacus*) of that country, and also some dried venom removed from the poison glands of the same three serpents.

The venom, as it has reached me, is not a very active one, the minimum lethal dose for rabbits being between 0.003 and 0.005 grammes (3 and 5 milligrammes) for each kilogramme of animal. At the same time, although this serpent is a member of the Colubrine family, the irritative effects at the position of injection, and even more so on the kidneys, following its absorption, are intense. In all of the experiments made with the venom alone, the urine voided within a few hours was of a dark red, almost black, colour, and was found to contain a large quantity of hemoglobin, but no blood cells.

Although the quantity of dry serum was small, there was sufficient to allow three experiments to be made for the purpose of determining if it can prevent death from being produced by a lethal dose of venom when the two are mixed together before administration. In one of these experiments the dose of serum was 1 c.c.m., and that of venom 0.005 grammes (5 milligrammes) per kilo. of animal; in the second, the dose of serum was 0.5 c.c.m., and the dose of venom the same as in the first experiment; and in the third experiment the dose of serum was 1 c.c.m., and that of venom 0.004 grammes (4 milligrammes) per kilo. of animal. In each case the gratifying result was obtained that the animal survived the administration of these lethal doses of venom.

It has thus been shown that venomous serpents themselves possess a definite substance in the blood serum, which possesses antidotal properties against their own venom and the venom of other specimens of serpents.

It is probable that the substance is produced from venom shed upon the mouth surface, and absorbed with the blood from this surface or elsewhere in the alimentary canal, and also from venom absorbed directly into the lymphatics and blood vessels of the poison glands. At the same time, the protection which is enjoyed by several species of serpents may also be produced by venom introduced into the body with the venomous snakes on which some of them, and especially the hamadryas, largely subsist.

The blood serums of the two species of venomous serpents that have been examined are certainly not so powerfully antivenenic as the serum which can be obtained from artificially-protected animals. They have, however, been obtained in conditions which are not the most favourable for determining their true value. This can probably only be done in the countries in which the serpents are found.

If this natural antivenene be found powerful, then a new, and in some respects convenient, source for antivenene will become available; but, even if the antidotal power be not so great as that of the serum of artificially-protected animals, it is not unlikely that its value may be increased and a sufficiently powerful antidote obtained more rapidly than with entirely unprotected animals by injecting several successive doses of venom into the serpents themselves.

ANTIDOTAL PROPERTIES AND USE OF ANTIVENENE.

Although some of the above experiments clearly show that it is possible to produce protection by introducing serpents' venom into the alimentary canal, this method is not so convenient, nor apparently is it productive of so powerful an antivenene as the method of subcutaneous injection. In a paper which has already been published in abstract the results of the latter method have been stated, and in that paper also the work of other experimenters, and especially of Sewall, Kaufmann, Kanthack, Phisalix and Bertrand, and Calmette has been referred to.

The experiments there described were made with the blood serum or antivenene of rabbits which had received by subcutaneous injections over periods of several months, either uniform non-lethal doses of venom or gradually-increasing doses until the last dose was thirty or fifty times greater than the minimum lethal. More recently the blood serum of a horse which had last received a dose estimated to be fifteen times the minimum lethal has also been examined.

The experiments were so planned as to obtain a definition of the antidotal power of the antivenenes, rather than to multiply examples of success in preventing death. With this object, four series of experiments were made. In the first the venom and the antivenene were mixed together *in vitro* before being injected; in the second the venom and antivenene were injected nearly simultaneously, but into separate subcutaneous regions; in the third the antivenene was injected 30 minutes before the venom; and in the fourth the venom was injected 30 minutes before the antivenene. In each series the smallest quantity of antivenene capable of preventing death from being produced by different lethal doses of venom was determined. Whereas antivenenes obtained from animals which for several months had received by subcutaneous injection doses of venom below the lethal were found to possess but little antidotal power, antivenenes obtained from animals which had received gradually increasing doses, until the last was 15 or 30 or 50 times greater than the minimum lethal, were found to possess powerful antidotal properties.

So minute a quantity, indeed, as the 100th part of 1 c.cm. per kilo. of weight of animal of the antivenene obtained from a horse which had last received fifteen times the estimated minimum lethal dose of cobra venom was sufficient to prevent death from rather more than the minimum lethal dose of venom when the two were mixed together before being injected.

Results obtained from experiments of this description, however, are in themselves insufficient as a basis for the application of this antidote in actual practice. With the same dose of venom a much larger dose of antivenene is re-

quired when the two substances are not mixed *in vitro* before being injected. Thus with an antivenene, which in the dose of 0.6 c.cm. per kilo. was sufficient to prevent death from twice the minimum lethal dose of cobra venom, when the two were mixed together before being injected, the smallest quantity that was sufficient to prevent death when each was injected separately, although almost simultaneously, under the skin of opposite sides of the body, was 4 c.cm.; and this latter quantity of the antivenene failed to prevent death from the same dose of venom, but 5 c.cm. per kilo. of antivenene were required when the venom was injected thirty minutes before the antivenene.

Such facts as these appear also to indicate that the antidotism is rather of the nature of a chemical reaction than of a physiological antagonism.

This supposition receives some support from the fact that a remarkable difference exists in the minimum lethal dose of venom for herbivorous as contrasted with carnivorous animals, to which I have already drawn attention. That this difference is partly, if not largely, due to the composition of the blood, and it may be of other constituents of the body, appears to be shown by such experiments as the following.

A number of young white rats—naturally herbivorous animals—were put on an animal dietary as soon as they had been weaned; and, with the slight addition of a little vegetable food once or twice a week, found necessary to maintain them in fairly good health, this dietary was continued for seven weeks. To one of the rats a dose of venom one-and-a-half times greater than the minimum lethal was then administered by subcutaneous injection, and although marked symptoms of poisoning were produced, the rat recovered. Two weeks subsequently, the animal dietary having been continued, another of these white rats received twice the minimum lethal dose, and it also recovered after a temporary illness. The experiments could not be carried further, as the other members of this family had fallen into bad health, and one after the other had died before this time.

In animals whose progenitors had subsisted mainly upon a vegetable diet, the conversion of the diet into that of carnivorous animals is, therefore, alone sufficient to reduce the vulnerability to venom, and to cause, in this respect, an approximation to the resistance of a carnivorous animal.

This fact appears also to indicate that the lethal effects of serpents' venom are due to a large extent to an influence on the blood, an influence as yet only partially and imperfectly recognised.

While experiments conducted on the plan I have described are essential for the purpose of obtaining an accurate knowledge of the antidotal power of any antivenene, in actual practice the best results would clearly be obtained by several successive administrations, rather than by one single administration, of the antivenene. Even if the first single dose were an insufficient one, life would in many instances be saved by following the first administration by several successive ones.

Thus, 0.5 c.cm. per kilo. having been found to be about the smallest quantity of an antivenene that could prevent death when given thirty minutes after rather more than the minimum lethal dose of cobra venom, this dose of venom was administered to a rabbit, and thirty minutes afterwards the insufficient dose of 0.4 c.cm. per kilo. of antivenene. In three hours the animal was lying extended with the head resting on the floor, limp and unable to stand; the respirations were infrequent and shallow, the cardiac action was feeble and irregular, and rattling sounds were being produced in the throat from the excessive salivary and bronchial secretion always produced by toxic doses of cobra venom. A second dose, consisting of 0.6 c.cm. of antivenene, was now injected under the skin, and very soon a marked improvement occurred in the condition of the animal, the respirations becoming deeper and the cardiac action stronger and more rapid and without irregularity. An hour subsequently a third dose of antivenene, consisting of 0.5 c.cm. per kilo., was injected, and further improvement was produced, so that all toxic symptoms soon disappeared, and the animal was restored to a nearly normal state, from which no relapse occurred until perfect recovery had been established.

In actual practice, also, it would be advisable to inject the antivenene in the first instance into the part where the venom

had been received, before the ligature, so widely recognised as valuable, had been removed, if the position of the snake bite had admitted of a ligature being applied, and even before the tissues surrounding the wound had been excised.

These and other directions accompany a supply of cobra antivenene which has been sent to India.

As it may be of interest to members of the Section, the antivenene is now placed before them in the two forms in which it has been prepared. The first is in liquid form usual in serum therapeutics. The second is the blood serum dried *in vacuo* over sulphuric acid, in which state it has the appearance of bright, translucent, orange-yellow fragments or scales. This dry antivenene is readily soluble in water, and it retains unimpaired the original antidotal power of the liquid antivenene. It therefore has obvious advantages over the liquid preparation in its stability and convenience of carriage and storage. In the dry state 11.5 parts represent 100 parts of the liquid serum, so that about 2.3 grammes would represent 20 c.cm. of liquid antivenene. It will probably be found that 20 c.cm. is a sufficient initial dose, which, however, should be repeated in half an hour or an hour, and even a third or fourth dose be administered, according to the condition of the patient.

It appears to me necessary to state, in conclusion, that however efficacious this antivenene may prove in a certain, and probably a considerable, number of cases, it must be anticipated that, as in all other instances of antidotalism, whether chemical or pharmacological, cases of snake bite will occur in which the antivenene cannot prove successful, it may be, because too large a lethal dose of venom has been received, or because the interval between the reception of the venom and the administration of the antivenene has been too long a one to admit of successful treatment.

As the dose of venom injected by a snake must always be an unknown one, an accidental concurrence of unfavourable cases may readily lead to unmerited distrust of the antidote; and therefore it is that a valuable further purpose is served by such experiments as those I have referred to, for they not only indicate the existence of limitations to the antidotal power of antivenene, but, at the same time, they prove by the most conclusive evidence that antivenene is capable of successfully preventing death, even in unfavourable conditions of administration, from not only small lethal, but also from large lethal doses of serpents' venom.

Professor STOKVIS (Amsterdam) was much interested in the possible effects of the epidermic application of antivenene. He stated that in the Dutch colonies it is customary for the snake catchers to prepare themselves before starting by rubbing all over their skin a powder made from the dried heads of snakes, with their poison glands. As a result of this precaution they either are not bitten, or they are rendered immune against the effects of bites.

SECTION OF LARYNGOLOGY: A CORRECTION.

In the summary of the proceedings in the Section of Laryngology of July 31st, in the notice of Dr. Risien Russell's paper on abductor centres in the cortex, it should have been stated that stimulation of one of these centres always resulted in abduction of both vocal cords, not, as stated, in abduction of the corresponding cord only.

SUCCESSFUL VACCINATION.—Mr. Wm. G. Loveridge, Public Vaccinator for the Humber-on-Barton District of the Brigg Union, has been awarded the Government grant for successful vaccination in his district.

DR. JOHN B. MURPHY (of Chicago), whose name is well known to surgeons in connection with the "button" introduced by him for intestinal anastomosis, has been elected President of the American National Association of Railway Surgeons.

IGNORANT ANTIVACCINATORS.—Dr. Edwards publishes in the *Lincolnshire Echo* and the *Shrewsbury Chronicle* excellent replies to the ignorant tirade of Mr. Williamson against vaccination. The appearance of such replies is extremely desirable and useful. Hitherto antivaccination letter writers have had too much their own way, and have succeeded only too well in poisoning the public mind.

MEMBERS PRESENT AT THE ANNUAL MEETING.

The following names of members and visitors attending the annual meeting were entered in the books provided for the purpose:

Abraham, Phineas S., M.D., London
Abrahams, E. L., M.R.C.P., London
Abercrombie, J., M.D., London
Ackland, R. C., M.R.C.S., London
Ackland, Theodore Dyke, M.D., London
Adam, A. M., M.D., Boston
Adam, James, M.B., Hamilton, N.B.
Adams, C. E., M.R.C.S., London
Adams, F. V., L.R.C.P., Glasgow
Adams, H., M.R.C.P., London
Adams, J. D., M.D., Mallock
Adams, J. O., M.D., London
Adams, John, F.R.C.S., London
Adams, William Francis, M.R.C.S., London
Adeney, E. L., M.D., Tunbridge Wells
Adkins, E. James, M.R.C.S., Hastings
Adkins, P. R., M.D., Clapham
Agar, S., L.R.C.P.L., Henley-in-Arden
Agar, S. H., M.R.C.S., Henley-in-Arden
Ainsley, T. G., M.D., Hartlepool
Alderson, F. H., M.B., London
Alderson, F. H., M.D., Hammer-smith
Alderton, T. G., L.R.C.P., Hammer-smith
Aldrich-Blake, Louisa B., M.D., St. Ann's
Aldridge, Charles, M.D., Plympton
Alexander, R. E., M.D., Hanwell
Alexander, S., L.R.C.P. Edin., Bromley-by-Bow
Alexander, T. A., M.D., Epsom
Alexander, T. G., M.D., Greenwich
Allan, Francis J., M.D., London
Allan, I. H. B., M.D., Montreal, Canada
Alibut, T. Clifford, M.D., Cambridge
Allen, B. H., M.D., Hastings
Allen, H. M., F.R.C.P. Edin., Hove
Allen, W. H., M.D., Stanmore
Allfrey, C. H., M.D., St. Leonards-on-Sea
Allingham, H. W., F.R.C.S., London
Alloway, T. Johnson, Montreal
Althaus, J., M.D., London
Anderson, Daniel Elie, M.B., Paris
Anderson, Elizabeth G., M.D., London
Anderson, J. B. M., M.B., Glasgow
Anderson, J. W., M.D., London
Anderson, Professor McCall, University of Glasgow
Anderson, W., F.R.C.S., London
Anderson, R. B., F.R.C.S., London
Antrobus, E. M.B., Great Malvern
Apple, L., M.B., London
Appleton, Thos. A., M.R.C.S., Fulham
Archer, S. A., M.R.C.S., London
Archer, Surgeon-Colonel S., London
Archibald, J. M. D., Beckenham
Argies, Robert, L.R.C.P., London
Arkie, C. J., M.D., London
Armitage, S. H. T., M.D., London
Armistead, H. W., M.D., London
Armstrong, George E., M.D., Montreal, Canada
Armstrong, H. G., M.R.C.S., Wellington College
Armstrong, Robert How, M.R.C.S., London
Armstrong, Samuel, M.R.C.S., Bournemouth
Armstrong, W. M., M.R.C.S., Duxton
Arnison, W. C., M.D., Newcastle-on-Tyne
Arthur, D., M.P., London
Ashe, W. F., M.D., London
Ashford, E. C., M.R.C.P., Bath
Ashlin, J. Thornhill, M.B., Fickering
Atkinson, Edward, M.R.C.S., Leeds
Atkinson, F. P., M.D., Strablin
Atkinson, G. A., M.D., Newcastle-on-Tyne
Atkinson, James, M.R.C.S., Crews
Atkinson, T. R., M.R.C.S., London
Atkinson, Walter Alexander, M.B., London
Attles, J. M. D., London
Atwood, W. T., M.R.C.S., Torquay
Auld, A. G., M.D., Glasgow
Auld, W., M.B., Wimbombie
Aveling, C. T., M.D., Upper Clapton
Axford, W. H., M.B., Bournemouth
Ayling, A. H. W., L.S.A., London
Aylward, W. C., L.R.C.P., Tunbridge Wells
Ayres, C. J., L.R.C.P., London
Baber, E. C., M.B., Brighton
Baker, G. T. U., L.R.C.P., Wellington-on-Tyne
Baker, W. G., M.D., Bournemouth
Baker, S., L.R.C.P.I., Manchester
Bagnall, W. H., L.R.C.S.I., Pau, France
Bagehawe, F., M.D., St. Leonards-on-Sea
Bailey, G. H., M.R.C.S., London
Bailey, R. C., F.R.C.S., London
Bailey, R. G., M.R.C.S.E., Stroud Green
Bailey, T. C., M.R.C.S., Crews
Bailey, W. T., Surgeon-Captain A.M.S., London
Bain, W., F.R.C.S. Edin., Stockport

Messrs. OPPENHEIMER AND Co. showed their Palatinoids, a useful form for the administration of medicine consisting of two convex discs of soluble jujube containing the purest drugs obtainable in the condition of powder or liquid without the addition of excipient unless the local effect of the medicament used would be either corrosive or extremely poisonous. Palatinoids are easily swallowed, accurate in dosage, and keep indefinitely. All drugs usually taken as powders, pills, or cachets, are supplied in this portable and elegant form. Palatinoids of Active Animal Substances: Thyroid Gland, equivalent to 5 grs. of the fresh substance; Thymus Gland, equivalent to 5 grs. of the fresh substance; Suprarenal Capsules, equivalent to 5 grs. of the fresh substance; Red Bone Marrow, equivalent to 5 grs. of the fresh substance; Pituitary Body, 2 grs. in each. These easily decomposable substances, being preserved perfectly airtight in the jujube envelope, keep perfectly for an indefinite period; the dose can be accurately exhibited, and the medication is free from every objection. Bipalatinoids: These are exactly similar in form to the Palatinoids. They contain two salts, which on admixture would suffer chemical decomposition. In the Bipalatinoid these are divided by a septum of jujube. When immersed in water or ingested, the contents are disturbed, and decomposition ensues. By this means the freshly-made Ferrous Carbonate, Ferrous Ascorbate, Ferrous Phosphate, and other easily oxidisable substances are rendered certain of absorption and assimilation. Palatinoids and Bipalatinoids were awarded the only gold medal at the International Congress of Medicine, Rome, 1894. Bipalatinoids of Fehling's Sugar Test, and the Ferrocyanide Albumen Test afford a means for the medical practitioner to test a suspected fluid at the bedside. A Bipalatinoid is dropped into the fluid contained in the test tube—in the case of sugar the fluid should be boiled—when the characteristic reaction is quickly apparent, if even a small trace of sugar is contained in the fluid. The Albumen Test may be used either in cold or hot solution, and is a sure indicator of a minute trace of albumen. This test does not react with peptones. Soluble Hypodermics: These are tiny pills made without compression. They are immediately soluble in cold water without trituration, so obviating the necessity for using pestle and mortar with the Pocket Hypodermic Case. A Soluble Hypodermic may be dropped into water in the barrel of the O. S. and Co. Hypodermic Syringe; it quickly dissolves, making a perfectly clear solution. The Soluble Hypodermics contain no acid or irritating excipients. Improved Hypodermic Syringe, in in-moulded aluminium case, with platinized-iridium needles. This instrument is the development of all the latest improvements in hypodermic syringes—incredibly light, durable, compact. The case is fitted to hold four tubes of soluble hypodermics; flexible leather cases in morocco; emergency cases for practitioners to carry a sufficient supply of soluble hypodermics or palatinoids in the pocket to meet any emergencies, night calls, etc. Their Solid Silver Hypodermic Cases are very handsome, portable, convenient, and inexpensive. Ergale contains all the active principles of ergot, including volatile principles that are dissipated in the course of preparation of the *B. P.* fluid extract or concentrated infusion. Concentrated Liquors for convenient accurate and rapid dispensing; they are standardised preparations perfectly miscible with water, and prepared with the purest drugs obtainable. Cream of Malt: This extract is prepared by a special process: it is especially rich in diastase and is a perfect food for brain, muscle, and bone. Cream of Malt with Cod Liver Oil: This consists of the purest cold drawn cod-liver oil dissolved in the cream of malt, which can be taken by the most fastidious. It is perfectly absorbed, does not excite nausea. Cream of Malt, Cod Liver Oil, and Hypophosphites is exactly the same as the foregoing, with the addition of a medium dose of the hypophosphites, soda, and potash. Several combinations of active substances with Cream of Malt were also exhibited. Pepsin, for which it is claimed that it does not contain any mineral, peptone, or added inert matter, is perfectly soluble in cold water, and remarkably active; it is supplied in three strengths: 1 gr. to digest 2,000 grs. of coagulated egg albumen, 1 to digest 3,000 grs., and 1 to digest 6,000 grs. when submitted to the *B. P.* test for pepsin. The Globe Nebuliser and Nebulising

Solutions completely atomise oily and aqueous solutions, so that the vapour can be thoroughly inhaled up the nostrils into the Eustachian tubes and pulmonary organs. It is simple in construction and manipulation, so that the most ignorant patient can employ it without difficulty. All the active substances usually employed for inhalation, such as balsams, oils, aqueous and alcoholic solutions, may be thoroughly inhaled. Fluid Petroleum: This is a bland, non-irritating colourless, and odourless petroleum oil, and is specially adapted as a solvent for balsams, stearoptenes, and essential oils.

Messrs. PARKE, DAVIS AND Co. (21, North Audley Street, London, W.) exhibited Standard Fluid Extracts, in 4, 8, and 16 fluid ounce bottles. Fluid Extract Cascara Sagrada, as first introduced by them. Normal Liquids, a class of fluid preparations introduced by them. 1 c.c.m. of each said to be equivalent to 1 gramme of drug of standard strength. Solid Extract, extracts from drugs of determinable strength are accurately regulated by assay, and adjusted to a uniform standard. Powdered Extracts. Sugar-Coated and Gelatine-Coated Pills: These pills are coated by a method avoiding the application of any degree of heat which could impair their efficiency. Enteric Pills coated so as to pass the stomach intact, and dissolve in the duodenum and intestinal tract. Pink Granules, sugar coated: these granules are intended to supply the needs of physicians in cases requiring minute or frequently repeated doses. Ophthalmic Tablets: these tablets dissolve readily in distilled water, and hence can be employed for the extemporaneous preparations of solutions. Hypodermic Tablets: the materials are said to be non-irritating in character, and each tablet contains precisely the quantity of medicament stated on the label. The tablets are soluble, disintegrating in water almost instantly, and in a few seconds making a limpid solution. A Newly Improved Hypodermic Case, made of pure aluminium, light, compact, convenient shape, and will not tarnish. Medicinal Elixirs, Wines, and Syrups designed to present medicines in a form agreeable to the palate. Soluble Gelatine Capsules, Filled, prepared from the finest gelatine by improved processes and apparatus, very soluble and easy to swallow. Medicated Lozenges supplied in any formula, shape, colour, or flavour to order. Olives, a normal or undiluted chemical combination. Simple's Atomising Inhaler provides a constant supply of vapour in a reservoir and secures the topical effects of medicated vapour on the respiratory tract. Inhalants for Use in Atomising Inhalers. Tablet Triturates. Tablet Triturate Cases: their tablet triturate cases contain various assortments of tablets. Compressed Tablets. Taka Diastase an isolated ferment in concentrated form for the treatment of amyaceous dyspepsia. Their Digestive Ferments exhibit included Pepsin Aseptic, ranging in strength from 11,000 to 115,000; Saccharated Pepsin, U.S.P.; Glycole of P.p.in. Concentrated; Pepsin Cordial; Lactated Pepsin; Ether Lactated Pepsin; Sugar-coated Pepsin Tablets; Lime Juice and Pepsin; Liquid Pancreatin, Concentrated; Saccharated Pancreatin; Peptonising Tablets, Improved; Digestive Tablets; Pure Pancreatin. Rennin, a milk curdling ferment, distinct from but associated with pepsin in gastric juices. Medicinal Specialties and Requisites: Iodoform Bougies, Gelatine-coated, Empty Oral Gelatin Capsules (Improved), Empty Rectal Suppository Capsules (Improved), Chloroform Liqueur Sedans, Nasal Tablets, Nuchin, Antipne Tablets, Syrup Homatin Hypophosphites, Nutrient Suppositories (Glycerine Suppositories), Syrup Trifolium Compound, etc. Physian's Pocket Reagent Case fitted. Antidiphtheritic Serum: This serum is prepared in their bacteriological laboratory. Its strength has been determined by Behring's method, and every precaution has been taken to ensure its sterility. Culture Media (Sterilised) for pure cultures of bacteria. Peptonin, the fermentable element of food, Lactopository; Antipne, antineuralgia, analgesic, stated to be useful in typhoid fever.

The PEAT INSURANCE SYNDICATE, Limited, exhibited a variety of articles manufactured from Peat Fibre, the value of which is based on its peculiar properties which are now becoming so well known as an absorbent, deodoriser, and natural antiseptic. The article which is perhaps of most interest to the medical profession is Peat Wool for Surgical Dressing, for which the following advantages are claimed.

Greater powers of absorption than any other material (being capable of absorbing nine or ten times its own weight of liquid). Durability: Owing to the great absorbing power and the fact that its operation is very gradual, the dressing can remain much longer on the wound than the ordinary kinds. Power of resisting putrefaction and fermentation. Permeability, that is, the discharges become diffused throughout the dressing instead of "coming through" at one spot. Its remarkable deodorising power. Its cheapness—an important point, especially in hospital practice. Great virtues has been laid on these advantages by Continental surgeons who have used the peat wool. The peat wool is also used for making absorbent sheets for accouchement, etc., and for sanitary towlettes for ladies. For the latter purpose the absorbency and the freedom from odour of the peat, combined with its power of destroying all other odours, can scarcely be overestimated. There are also exhibited Rugs and Blanketing Materials woven from peat fibre, the value of which rests on the same properties as that of the surgical dressing and on the fact that insects will not live in peat. Peat powder, a bye-product, is a natural antiseptic and deodorant, which is largely used in dry systems of excreta removal. It is also made a most powerful disinfectant by chemical treatment.

Mr. YOUNG J. FENTLAND showed Dr. Radcliffe Crocker's *Atlas of Skin Diseases*; specimens of a new *Atlas of the Fungus Oculi*, which is being prepared from original drawings belonging to Mr. Adams Frost, F.R.C.S.; and a selection of Coloured Plates, which are used in the illustration of the publications which he issues.

THE PEPTENZYME COMPANY (25, Alfred Place West, London, S.W.) exhibited Reed and Carnrick's Peptenzyme, said to present in functional physiological activity all the digestive agents of the animal economy, stomach, pancreas, spleen, salivary and Brunner's glands, and Lieberkuhn's follicles and free nuclein, the tissue builder of the organism. These glands are extracted mechanically without the use of acids or chemicals.

PRICE'S PATENT CANDLE COMPANY, LIMITED (Battersea) showed their Pure Glycerine, as introduced by the Company in 1855. Price's Sanitary Soaps: Glycerine and Carbolic Acid, Glycerine and Coal Tar, Glycerine and Eucalyptol, Glycerine and Salicylic Acid, Glycerine and Thymol. These glycerine sanitary soaps are prepared from the purest materials, and besides containing those antiseptics which experience has shown to be efficient, contain also a sufficient quantity of glycerine to render them highly emollient. Price's Solidified Glycerine Soap: The transparency of this soap is due to the large proportion of glycerine present. Price's Nursery Soap ("Bonne Mère"): Specially prepared for use in bathing infants. Price's Palmatine Bath Soap; Price's Glycerine Cream Soap. Price's New Patent Night Lights: These lights have steadily grown in favour since they were introduced in 1855. Price's Royal Castle Paraffin Night Lights: These have been introduced in order to utilise the valuable light-giving properties of paraffin wax.

THE REDMAN PUBLISHING COMPANY exhibited Medical, Surgical and Hygienic books; among them the following deserve special mention:—Pepper, *System of Medicine*; Starr, *Diseases of Children*; Baldy, *Gynecology*; Keen and White, *Surgery*; Warren, *Surgical Pathology*; Vierordt, *Medical Diagnosis*; Hamilton and Godkin, *Legal Medicine*; *Sujous' Annual*; Moore, *Meteorology*; Robinson and Cribb, *Food and Drugs*; *Atlas of Skin Diseases* (St. Louis Hospital, Paris); Norris, *Obstetrics*; Keating, *Life Insurance*. Pure Animal Lymph in tubes. Vaccine cream in flacons. For this it is claimed that it has unequalled stability. The flacons are strong, neat and elegant, easily carried about, easy to open and close, and practical in every regard. An interesting exhibit of Pathological Preparations (models) of the Throat and Tongue made by Dr. Paul Berliner, of Berlin under the direct supervision and guidance of Professor Virchow. *Inter alia* there are: (a) Larynx with polypoid growth just below left vocal cord. (b) Phthisis of larynx, ulcerations of epiglottis, edema of left vocal cord, etc. (c) Laryngitis and tracheitis ulcerosa tuberculosa, etc. (d) Tuberculous ulcerations of larynx. (e) Larynx showing miliary tuberculosis. (f) Destructions caused by lupus. These models are well executed and true to Nature.

Messrs. ALEXANDER RIDDLE AND Co., (36 and 38, Commercial Street, E.) were present, showing Stower's Lime Juice Cordial, an excellent table drink. It is used for rheumatism, gout, eczema, pneumonia, and all fever and inflammatory cases. Stower's Clarified Lemon Squash, a more recent production, and one that may not contain all the therapeutical properties of the lime, is still a very refreshing beverage. It is most carefully manufactured from the juice of Messina lemons and pure cane sugar.

Messrs. J. ROBERTSON AND Co.'s (Edinburgh) exhibit consisted of Acidified Perchloride of Mercury Pellets for the immediate formation of an antiseptic solution by dissolving in water. Flexible Gelatine Capsules: They call special attention to the Bland's Capsules. They are the only ones which contain the ingredients in an uncombined state, so that the ferrous carbonate is formed in a nascent condition after administration; also capsules of sulphonal, cascara, cascara and euonymin, and nux vomica, guaiacol, guaiacol carbonate, hypophosph. co., paraldehyde, and numerous others. This firm also exhibit Fluid Extract and medicinal syrups; also gelatine perles of chloroform, creasote, ichthyol, guaiacol, apiol, etc. Syrup Hydrodate co. is a special preparation introduced by them.

Messrs. ROBINSON AND SONS, LIMITED (Wheatbridge Mills, Chesterfield, and 55, Fann Street, Aldergate Street, E.C.) were showing a selection of Antiseptic and Absorbent Surgical Dressings. This exhibit includes the various qualities of cotton lints, among which may be mentioned their XA Lint suitable, both on account of its quality and price, for hospital use. Better qualities are their brands marked 3.0, XSS, and I. The bandages shown are of four qualities, namely, open woven grey, fine grey calico, fine white water dressing, and strong white water dressing. Seven grades of Corded Cotton Wool, varying in their absorptive power, are shown, also their "Extra Super" Absorbent Wool. All these various dressings as well as absorbent gauzes are shown medicated with the various antiseptics used in the Listerian system of antiseptic surgery. A notable feature is their cases of aseptic dressings, including gauzes, wool, and sponges. One of the most recent additions to surgical dressings is here shown, namely, Cellulose Wadding, a patented article, for which this firm is the sole manufacturer. This dressing is manufactured from pure white pitch pine fibre. They also showed a Bandage Shoot, and a "Non Runaway" Bandage.

J. M. RICHARDS (46, Holborn Viaduct, London) exhibited Lactopeptine Tablets. Lactopeptine is now prepared in tablet form, each tablet containing 5 grains. The dose, therefore, is easily regulated. The tablets are small, soluble, and agreeable in flavour. Lactopeptine Powder, which is as a mixture of digestives fully up to date.

Messrs. SALAMON AND Co. (Rainham) exhibited their purest Chloroform in 1lb. and ½lb. blue bottles, and their Absolute Ether Puriss., 720 Lots (trade mark) in 1lb. and ½lb. white bottles. Both articles are specially manufactured for anaesthetical and medicinal purposes.

THE SANITARY WOOD WOOL COMPANY, LIMITED (Chavies Inn, London) showed Hartmann's Patent Wood Wool Wadding, which is thoroughly antiseptic, gives perfect drainage, does not heat, absorbs discharges of every description. Over 200,000 lbs. is said to be sold annually. It is adopted in some 200 hospitals. Hartmann's Patent Wood Wool Tissue, in a continuous roll, consisting of a layer of Hartmann's Patent Wood Wool Wadding between two pieces of sublimate gauze, possessing all the advantages of the wadding, with the advantage that any size pad can be cut off with the scissors. Hartmann's Sanitary Wood Wool Sheets, made in three sizes, at 1s., 1s. 6d., and 2s. 6d. These sheets are made of Hartmann's Patent Wood Wool Wadding; they are perfectly antiseptic. In accouchement a large sheet is laid under the patient; it absorbs the discharge and is simply burnt after use, risk of puerperal fever greatly lessened, and comfort and cleanliness ensured. These sheets are also used for bedsores, operations, etc. Hartmann's Hygienic Wood Wool Towellettes, for menstruation, and a special make for accouchement. They are comfortable and healthy; they are soft and antiseptic. The risk of infection is avoided. After use they are simply burnt. Hartmann's Towellettes are made chiefly of pure pine, and are antiseptic and soft. Hartmann's Complete Guinea Outfit for Accouchement; also

a smaller Outfit for 10s. 6d. The complete set contains all the necessary Hartmann's sanitary wood wool sheets and towels, macintosh, binder, safety pins, fuller's earth, coarse black thread, antiseptic ointment, etc. It affords great cleanliness, and diminishes the risk of puerperal fever. Hartmann's Patent Wood Wool Vaccination Pads. The following advantages are claimed for this protector: It protects the arm from external violence; it absorbs all discharges and reduces the risk of septic absorption and blood poisoning. It cannot be used a second time like ordinary "shields," which it is too often the dangerous practice to use again and again. Lastly, and not its least advantage, is its cheapness. Hartmann's Sanitary Wood Wool Gonorrhoea Bags: They absorb the discharge and avoid soiling the clothes. Hartmann's Patent Method of Packing Sterilised Dressings, as applied to all wood wool manufactures, as well as cotton wools and gauzes. By this patent method the difficulty of obtaining an "aseptic" dressing at a cheap price is overcome. The dressings are packed in tubes of thick parchment, a plug of cotton wool is inserted at each end, and steam above 100° is passed through the tubes, and the ends are then drawn up tightly over the cotton-wool plugs, leaving the dressings sterile until required for use. These packets are portable and possess many advantages over the former expensive methods of packing sterilised dressings in glass jars and tins. Hartmann's Catgut put up in juniper oil and preserved in alcohol absolute; also supplied in a raw state for treatment by surgeons themselves. Hartmann's Absorbent Wood Wool Sponges for abdominal operations, put up in three sizes in antiseptic and sterilised forms.

The exhibit of the **SANITAS COMPANY, LIMITED** (Bethnal Green, London, E.), includes Sanitary Disinfecting Fluid for general disinfecting purposes, spraying (oxygenating) the air, gargling sore throats, washing wounds and linen, for use in the bath, and for tender feet. Sea-Water Fluid, a deliquescent disinfecting agent. Pump Spray and Bellows Sprays for distributing the fluids. Disinfecting Oil for fumigating sick rooms, etc., and for inhalations in cases of bronchitis, lung and throat affections; also for treatment of ringworm and rheumatism. Soluble Oil, a preparation of Sanitas Oil made miscible with water for disinfecting purposes. Inhalers and Sanitas Pocket Inhalers for dry inhalations in cases of lung and throat affections. Disinfecting Fumigator and Bronchitis Kettle for moist inhalations in cases of lung and throat affections. Disinfectors for the automatic and continuous purification of the air of waterclosets, rooms, etc. Eucalyptus Disinfectors for the automatic and continuous purification of the air of waterclosets, rooms, etc. Eucalyptus Disinfectors (reservoir pattern) for the automatic and continuous purification of the air of waterclosets, rooms, etc. Eucalyptus Soap. Eucalyptus Oil for the automatic and continuous purification of the air of waterclosets, rooms, etc. Disinfecting Emulsion and Sanitas Crude Disinfecting Fluid for drains, sewers, closets, large water, street watering, and general outdoor use. Disinfecting Powder for urinals, sewer mud, ashbins, earth closets, stables and kennels, farmyard sweepings, etc. Sanitas Air Purifier and Sawdust for the disinfection of kennels, stables, poultry runs, rabbit hutches, cattle sheds, bird-cages, etc. Instemper for whitening and disinfecting walls, ceilings, etc. Disinfecting Soaps. Disinfecting Jelly for dressing wounds, burns, and sores. Sanitas Antiseptic Cream for use on the skin during desquamation, and for perspiring feet, wounds, burns, and stings. Toilet paper, soluble and medicated. Furniture Paste, a household disinfectant. Antiseptic Gauze, a dressing for surgeons' use. Absorbent Wood for hospital use. Pocket Disinfectant, specially recommended for clergymen, children, and all who visit sick rooms. Kingzett's Patent Mercuric Bactericide. Kingzett's Patent Preserved Peroxide of Hydrogen. Kingzett's Patent Sulphur Fumigating Candles for disinfecting sick rooms and hospital wards, etc. Kingzett's Patent Sulphurators for the fumigation of kennels, stables, fowl houses, pigeon lofts, and rabbit hutches, etc.

MR. J. O. S. SKEY (Oxford) exhibited a working model of an Invalid's Bed, with reading-stand, table, candle, and light-shade, which he has invented; this bed can be put at any incline, or raised or lowered as required for operating or nursing, by means of a screw at either end.

Messrs. SAVORY AND MOORE show, amongst other well-

known preparations, their Best Food for Infants, which was introduced more than thirty years ago, and, in spite of imitations, still gains in favour with the medical profession. A very useful variety of this food which they also show is made with whole meal, in accordance with the suggestion of a well-known authority on infants' feeding. They also show their Pancreatic Emulsion, which as a fat food is certainly not sufficiently known or used by the medical profession. Their Peptonised Condensed Milk and Cocoa Milk also deserve notice. Peptones in various forms; Pepsine, Pancreatine, and their respective preparations, for which the firm is justly so well known; Gelatine Lamellæ, for internal, hypodermic, and ophthalmic use; and various other useful and elegant preparations are exhibited in great variety, and the whole forms a compact and interesting collection.

MR. K. SCHALL, of 55, Wigmore Street, had a very large collection of Coils, dry and liquid Continuous Current Batteries, Electrodes, and Instruments and Batteries for Light and Caution. Amongst the novelties we notice the following things: Spamer Coils, provided with Obach dry cells (instead of the usual acid cells), working the coils for about seventy hours altogether before requiring to be renewed. A new Sledge Coil, suggested by Dr. Lewis Jones, worked by a large dry cell. A Board, with resistance, etc., for utilising the 100-volt continuous current for galvanisation, electrolysis, and faradisation. A large Wimshurst Machine in glass house, with four plates, giving sparks of about 7 inches. A cheap Transformer, for utilising the alternating current supplied for lighting houses, for cautery and small surgical lamps. A Rheostat for the same purpose, for use in connection with continuous current installations. An Arc Lamp, with lenses, on a stand, for laryngoscopic examinations. A Focus Lamp, with bull's eye and ground glass plates for laryngoscopic or ophthalmoscopic purposes. A Powerful Motor, with trephines, saws, etc., for surgical purposes. A cheap and very efficient Centrifugal machine, for separating blood, milk, urine, etc., working efficiently without the aid of a motor. An Ophthalmometer, provided with electric lamps behind the transparent glass windows, and giving surprisingly clear and sharp pictures on the eye of the patient.

THE SCIENTIFIC PRESS, LIMITED (428, Strand, W.C.), showed a number of their publications. Upon their stall were to be found a number of interesting medical works and manuals for students and nurses. Amongst the former were the well-known reports of the Johns Hopkins Hospital Medical School of Baltimore. The high-class publications of the W. T. Keener Co., of Chicago, were also a source of attraction. For both these series of publications the Scientific Press are the sole agents in the United Kingdom. Amongst their own publications we notice Dr. Withington's interesting *Medical History from the Earliest Times*, Dr. Ogilvie Will's *Genito-Urinary Diseases: Surgical Ward-Work*, by Dr. Miles; a new handbook on *Midwifery*, by Dr. Francis Haultain; *Ophthalmic Nursing*, by Dr. Sydney Stephenson; Dr. Percy Lewis's *Theory and Practice of Nursing*; *Mental Nursing*, by Dr. William Harding; *Insanity*, by Dr. Francis Walmaley, etc. A work which is sure to attract attention is Mr. Henry C. Burdett's work on *The Hospitals and Asylums of the World*. They showed also a series of account books specially designed by Mr. Henry C. Burdett, for use by the secretaries and managers of hospitals and institutions. These books are ruled in accordance with the uniform system for keeping institutional accounts as adopted by the Metropolitan Hospital Sunday Fund. The same author's *Helps in Sickness and to Health and Hospital and Charities Annual*, now in its sixth year of publication, and generally recognised as the standard work on the subject. The many works on diet, both for adults and infants, massage, nursing, the duties of hospital sisters, etc., are well worth a notice. *The Hospital and Science Progress* were also shown.

MR. H. SILVERLOCK (32, Blackfriars Road, London, S.E.), and 70, Knightbridge Street, E.C.), exhibited his Medical Practitioners' Visiting Lists for 1896. The General Practitioners' Visiting List, Journal, Almanac, and Memorandum Book for 1896; by C. M. Kempe, M.R.C.S. and L.S.A. Medical Label Cases. Prescription Books. Silverlock's System of Medical Book-keeping. Dr. Hardwick's System of Medical Book-keeping. Silverlock's Medical Practitioners' Ledger.

Silverlock's Obstetric Register, or Case Book; suggested by Matthew Hamilton Taylor, M.D. Silverlock's Midwifery Record Book, The Dispensing List and Calendar, as suggested by Robert Jalland, L.R.C.P. The Repeat List; E. T. Aydon Smith, L.S.A. Medicine Bottle Cases, Diet Cards for the Consulting Room. Diagrams for Clinical Use in Hospitals.

THE SOCIETY OF ANAESTHETISTS had an Exhibition and Demonstration of the various appliances employed in connection with the Administration of Anaesthetics.

THE SOCIETY OF MEDICAL PHONOGRAPHERS had on show the Publications of the Society, and Examples of the Use of the Phonograph.

Nothing says the *Chemist and Druggist*, in the Exhibition itself was equal in style to the "side shows" if it is permissible to so allude to the very stylish and costly undertakings of Messrs. Oppenheimer Sons and Co. (Limited), and of Messrs. Hertz and Collingwood in the Savoy Hotel next door. We describe the former exhibition elsewhere. Messrs. Hertz and Collingwood's was of quite a different character. Special invitations were issued to the principal doctors attending the meeting to visit the "Princes Ida" rooms for the purpose of tasting the Laurent Perrier's champagne. The rooms were some of the choicest in the hotel, on the first floor, with a balcony attached overlooking the Thames Embankment. Elegant luncheon was provided, and with these the Laurent Perrier "sans sucre" champagne was served. Samples of the Laurent Perrier "Coca-tonic" champagne, and of the firm's new wine, "Jervoise"—a fine old sherry, with which is combined an extract of cinchona—were also offered. Specimens of Jensen's cod liver oil and of the Levico and Franz Josef waters were shown in a glass case. Some hundreds of leading medical men were entertained in this manner by Messrs. Hertz and Collingwood.

THE CHOLERA TRAFFIC TO MECCA.

At a meeting of the Supreme Legislative Council of India held at Simla on July 11th Sir Alexander Mackenzie made a long speech in introducing the Bill to make better provision for the regulation of pilgrim ships, explaining that the Secretary of State had given orders for the revised regulations being brought into force before the pilgrim season of 1895-96, hence the Bill must come into force from October 1st next and the question could not be left over for discussion by the Select Committee now. Dealing with the Indian Merchant Shipping Bill, the mover, in referring to the question of cholera being introduced into Europe said: "I think I am correct in saying that there is no well authenticated instance on record of cholera having been imported into Europe or Egypt from India by sea." Sir A. Mackenzie having given an interesting epitome of the details of conferences hitherto held on the subject of special regulations for the pilgrim traffic, stated that the following were the chief changes in the law which the recent conference at Paris renders necessary: (1) In future every vessel embarking pilgrims for the Hedjaz will be treated as a pilgrim ship provided only that no ship carrying passengers other than pilgrims of the lowest class and having on board pilgrims of the lowest class in a less proportion than one pilgrim for every 100 tons will be deemed a pilgrim ship. (2) The captain must give three days' notice of his time of sailing instead of twenty-four hours as at present. (3) Her Majesty's Government have hinted to the French Government that the minimum standard of one and a-half square metre, namely, sixteen square feet, will be prescribed on all Indian ships for every pilgrim of whatever age. This will add to the cost of passage for pilgrims. (4) The Convention provides that an upper deck shall be reserved for the use of pilgrims and kept clear of encumbrances, and that hospital accommodation at the rate of 32 square feet for 5 per cent. of the pilgrims is provided. The Bill also provides for medical inspection before embarkation. (5) The captain of a pilgrim ship is bound to pay the whole amount of sanitary taxes levied by the Turkish Government, which adds to the cost of the passage ticket. A suggestion has been made that needy pilgrims be excused this impost, and it is hoped it will be accepted by the Porte. (6) A second medical officer is to be appointed on a ship carrying over 1,000 passengers, the seventh provision introduced omitting the rule compelling ships to call at Aden

on the return journey. Sir A. Mackenzie concluded by stating that the Government of India will lose no opportunity of safeguarding the interests of its Mohammedan subjects. The Bill has been referred to a Select Committee with instructions to report after one month. The recent meetings of Mohammedans held in Calcutta and Hyderabad to hear addresses from Mr. Ernest Hart have dealt with the further important questions of sanitation of the Hedjaz.

THE BRITISH INSTITUTE OF PUBLIC HEALTH.

THE ANNUAL CONGRESS of the British Institute of Public Health met on August 8th at Rymer's College, Hull, under the presidency of the Mayor, Alderman Richardson, who was supported on the platform by Alderman Frazer (Chairman of the Hull Sanitary Committee), Sir C. Cameron, Sir H. D. Littlejohn, Professor W. R. Smith, Sir A. K. Rollett, M.P., and the mayors of several provincial towns.

In welcoming the members the Mayor of Hull said that much time, thought and money had been expended on sanitary matters in that town. In 1847 the population was 70,000 and the death rate was then 31 per 1,000, whereas last year the population had increased to 216,000, while the death-rate had fallen to 15.9.

The Mayor of Hull drew attention to the expenditure they had had to undertake in the provision of hospital ships and in other measures with the object of preventing the incursions of cholera. Much of the benefit of these measures was reaped by inland towns, which were thus protected from the disease, and he thought the expense to which they had been put should become a national charge.

The Mayor of Folkestone said his borough also had been put to considerable expense in regard to the Continental traffic, and he trusted that the Government would be induced to make the charge a national one.

The Mayor of Bournemouth also spoke in the same strain. On August 20th an address was delivered by Sir A. K. Rollett, M.P., who urged the desirability of a very considerable extension of the principle of local government. Every effort should be made to relieve the congestion of work in Parliament and to resort local affairs to local authorities subject to the minimum of central control.

Surgeon-Lieutenant Colonel FRINGLE opened a discussion on cholera and speaking of the port expenses said that the local port authorities should no more be called upon to pay the expense of keeping out the cholera than they should be called on to support the gunboats that guard our shores.

On Saturday the members proceeded to Scarborough, where they were entertained at dinner by Mr. C. H. Wilson, M.P. for West Hull.

On August 12th a discussion was held on municipal abattoirs and meat inspection, in the course of which Sir H. D. Littlejohn said that in Edinburgh private slaughterhouses had been abolished for nearly 100 years, and not only were the public benefited but the butchers also, the facilities offered enabling them to carry on their business at a cheaper rate than in private slaughterhouses.

The provision of facilities for cremation by urban authorities was also discussed, Dr. Rogers, of Hull, stating that a motion had been carried in the Hull Town Council in favour of providing a crematorium and that a site had been already arranged for the purpose. Dust and refuse disposal and the water carriage of sewage were also among the subjects discussed.

Professor SMITH, in opening a discussion on the influence of schools upon diphtheria, expressed the opinion that if Board Schools had been the cause, or one of the causes, of the spread of diphtheria such increase would have taken place over the whole of the country, which had not been the case.

The proceedings of the Congress terminated on August 13th. Various resolutions and votes of thanks were passed, a special communique being paid to Dr. Mason, the Honorary Secretary of the Reception Committee, for his indefatigable zeal in furthering the success of the meeting.

A CENSUS of centenarians has been taken in France, and the results which have been published, show that there are now alive in that country 213 persons who are over 100 years old. Of these, 117 are women.

BRITISH MEDICAL ASSOCIATION. SUBSCRIPTIONS FOR 1895.

Subscriptions to the Association for 1895 became due on January 1st. Members of Branches are requested to pay the same to their respective Secretaries. Members of the Association not belonging to Branches are requested to forward their remittances to the General Secretary, 429, Strand, London. Post-office Orders should be made payable at the General Post Office, London.

British Medical Journal.

SATURDAY, AUGUST 17TH, 1895.

THE EAST LONDON WATER FAMINE.

THE citizens of London have been startled by the appearance of a fresh danger within their walls. Those who dwell inside the large area supplied by the East London Water Company, no fewer than 1,193,000 persons, have been for the last four weeks in the grip of a partial water famine. Their constant service has been replaced by an intermittent supply lasting for a few hours only each day, and meted out at uncertain intervals. Many of these East End householders are away at work for the greater part of the day, and owing to that absence are practically deprived of water for ordinary domestic purposes. They are thus put to the utmost inconvenience, and unfortunately the mischief does not end there. As in most modern towns, their system of sewage removal is by water carriage, so that absence of water means absence of removal of sewage, or in other words, clogged closets, urinals, drains, and sewers. If this state of affairs be allowed to continue it is clear that the health of the East End, and indirectly that of Greater London, must inevitably suffer, for in a matter of this kind it is impossible to deal with the one apart from the other. At the present moment East London is furnishing the whole country with a valuable and suggestive object lesson.

The year 1895 will long be marked with a black letter in the annals of the East London Water Company. The supply has been twice curtailed, first in consequence of a severe frost, and secondly as the result of prolonged drought. Of the two the summer failure is likely to be far the more serious, chiefly on account of temperature conditions and the general prevalence of zymotic disease, especially in poor and crowded localities. Already the East End death-rate has risen and there has been a marked increase in the diarrhoea mortality. In a case of this kind it is difficult or, indeed, impossible to obtain proof of the direct causation of disease by a curtailed water supply. The general truth can be arrived at only by a careful analysis of the facts and figures of East London mortality before, during, and after the period of water scarcity and by comparing these returns with previous and coexisting averages in surrounding districts. Diarrhoea, for instance, has increased in other parts of the metropolis where there is plenty of water. It will be a matter of time and patience to calculate fairly how many

deaths from that particular malady would have been prevented had the East London Water Company not failed in its supply. This and kindred points, however, will no doubt form the object of searching official inquiry, which will eventually add a valuable chapter to the history of practical sanitation in this country.

The effect of such a state of things as has just been described, both upon the convenience of working-class families and upon domestic sanitation generally may easily be imagined. The populations have been complaining bitterly, but they are practically helpless. There is no cheap and summary means of redress, although the permanence of the supply is supposed to be secured by Act of Parliament; and the Company, in answer to all remonstrances, calmly put down the whole difficulty in the first place to the drought, and in the second place to the wickedness of the County Council.

So far as we are concerned, it is not so important to consider what was the original cause of the difficulty as it is to discover by what means it may be ended before it breeds an epidemic, and how its recurrence may be avoided in future. The statistics of the Metropolitan Asylums Board make it sufficiently clear that the curve of zymotic disease is rising rapidly. A period of hot days may at any moment accentuate the mischief, and there is no certainty that the rains we have had will not fail us again for another period of dry weeks. Yet the company seem to be "trusting to luck," for up to the present we do not hear that they have taken any immediate effective steps to remedy this glaring public mischief, or that anyone has discovered a means by which they may be effectively compelled to supply a better service.

It is perfectly clear, however, that there are various ways by which a better service could at once have been or could now be obtained, if sufficient pressure were brought to bear. We believe that the arrangements between the East London Water Company and the New River Company are of such a character that the East London Company could, at a slight pecuniary sacrifice, obtain a large addition to their actual supply by arrangement with their more powerful neighbour.

Then there is the question of the supply of water by meter to the sanitary authorities on the one hand, and to business customers on the other. In the latest available report issued by the Local Government Board, it appears that the East London Company have been selling by meter no less than 23 per cent. of the total water which they obtain. We do not hesitate to say that this state of things is scandalous.

Those for whom the domestic supply is intended have undoubtedly, both in law and in every other sense, a paramount claim. They, moreover, have perforce to pay their water rates, whether they get anything to drink or not. The customers who receive their supply by meter naturally will not pay if they do not get the commodity they pay for, but as far as compulsion is concerned, it is obvious that they could not compel a water company to supply their needs in preference to the necessities of the domestic constant supply.

We are glad to hear that steps are already being taken by some of the sanitary authorities to obtain water for flushing their sewers and for watering their streets from other sources than the East London Company. The project of

bringing sea water to London for such purposes has been seriously pressed in many quarters, and we hope an effort will be made to carry it out on a sufficiently large scale. It is nothing less than monstrous that, when the supply of London drinking water is so inadequate, it should gratuitously be made worse by using a large proportion of the stock for purposes for which, however necessary they are in themselves, other water supplies would do as well.

Mr. Binnie, however, as the engineer of the London County Council, has recently been asked to report upon the situation, and he has made a most remarkable suggestion, in which, it seems to us, there is in all probability great truth. He declares, upon the Company's own figures, that they have been drawing during the recent months a relatively enormous quantity of water, and that it is plain that a large proportion of the water they have obtained cannot have reached their consumers at all. They have, in fact, drained the Lee dangerously low, and yet East London can get no reasonable supply for their taps. His inference is that there is evidently some new cause of waste as compared with previous years, and that the only possible explanation of this phenomenon is that the Company's mains were cracked and damaged by the great frost in a large number of places, where they have calmly been left un-repaired. The result is that the water, which it is of vital consequence to deliver to the poverty-stricken populations of East London, is leaking away unheeded underground.

The Company themselves unconsciously confirmed this theory, before it was made public, by alleging, as an explanation of the bad quality of some of their water, that impurities must have found their way into it by cracks in their mains, after it had left the filter beds. All we can say is that if it should be proved that a company charged with so vital a public duty and handsomely paid for the service, has brought on a water famine by neglecting to repair its own pipes, there is no available punishment which would be adequate to the offence.

As to the Company's constant cry that the whole difficulty would never have arisen if the County Council had not opposed their Bill for additional capital in the session of 1893, it is, to those who are acquainted with the facts, a very idle and audacious excuse. The recently published County Council documents set out very clearly what was the real point of the discussion in Parliament, and make it sufficiently plain that the Company might have had, even in 1893, any powers that were really necessary for an efficient supply; but that they preferred to endeavour to steal a march upon the community by getting a Bill rushed through the House which would have enormously increased the purchase price to be paid for their undertaking if it were ultimately resolved that it ought to be purchased by the community. This proceeding was opposed by the County Council in 1893, and upon the full consideration of the Bill in 1894 the necessary amendments were inserted by the House of Commons Committee before they passed the Bill.

These quarrels, however, are of little interest and less consequence to the people who are suffering from drought, and who are threatened with disease. It is the duty of all who are interested in the public health to see that instant steps are taken to compel the Company to return to a constant supply of pure water, even if the necessary cost of doing so should mean a slight reduction in their next dividend.

We ought to add that with the occurrence of each new rainfall the unfortunate consumers are threatened with a fresh danger from a different cause. The East London Company and all the other companies, except the Kent, are almost certain to open their intakes greedily to every new rush of flood water which a day's rain may produce in the hope of replenishing their deficient supply. The result of this may easily be more disastrous than any mere lack of water. It is now perfectly well known by the more accurate bacteriological tests that the scouring water which comes down the Thames and the Lee at the first onset of any rainfall is not only itself heavily charged with organisms, but is dangerously impure from the point of view of organic contamination, even after it has run through such filtrations as the companies provide. If the East London Company serves out such water to its customers to relieve them from the recent dearth, the cure may be worse than the disease.

SMALL-POX AT THE EAST-END OF LONDON.

THE recent increase in the number of cases of small-pox occurring in London, more particularly in the East-End of London, has been the occasion for the expression of a variety of opinions. The extent to which the vagrant class has been affected, and the frequent occurrence of cases in which infection appears to have been spread by the inmates of Salvation Army shelters, has directed particular attention to the need for placing these institutions under sanitary supervision.

It has been decided in the courts of law that the Common Lodging House Acts do not apply to refuges conducted on philanthropic principles; and hence while regulations as to cleanliness and the provisions of cubic air space are enforced in the places frequented by the "fourpenny dosser," no similar system of inspection is carried out in the case of the shelters resorted to by members of the vagrant class who cannot afford fourpence for a night's lodging.

Altogether apart, however, from the question of dissemination of disease by infected individuals, who may be compared to the sparks which serve to spread the fire, there remain to be considered the quality of the material attacked, and any special circumstances which may have influence as affecting its fitness or unfitness for promoting a blaze.

In relation to this it is not possible to attach much importance to the suggestion which has been made that the prolonged dry weather of the early summer has been responsible for the mischief. A drought may affect health in many ways, but it is not at all clear how it could in any way directly influence the spread of small-pox. Moreover the favourite season of prevalence of the disease is the spring, and outbreaks usually manifest a tendency to decline during the summer months.

A consideration of no little importance is, however, the growing percentage of children not accounted for in the vaccination returns. The increase in question has been during recent years particularly marked in London as compared with the rest of the country, and in London it has been most marked in some of the East End districts. Here, in the steady growth of a body of unprotected persons, is an increasing danger to the community, and one which is likely in the future to make its influence felt, and to play a part

in producing a much wider diffusion of small-pox than London has witnessed during the last few seasons, in which the disease has been limited to a modified spread among the vagrant class of the population.

AUTHENTIC copies of the address of Mr. Ernest Hart, as President of the Public Medicine Section of the recent annual meeting of the British Medical Association, have been supplied, by request, to the India Office in London. There may be reason to hope, therefore, that official notice will be taken of the somewhat trenchant criticisms and far-reaching suggestions which Mr. Hart thought it his duty to offer on the subject of the sanitary needs of India and the present position of the public medical services in relation to them.

It is suggestive of the singular attractions of London as a place of meeting that, well chosen and excellently arranged as were the various excursions in connection with the recent annual meeting of the British Medical Association, very few of them filled up their lists, and in the majority of instances members preferred to avail themselves of the numerous invitations in London and its various sights and entertainments.

THE Mayor of Cork has invited the Grand Master of the Oddfellows' Society, the Secretary of the Young Men's Society, and the President of the Bakers' Association to a conference with the representatives of the South of Ireland Medical Association, in order, if possible, to effect an arrangement of the matters in dispute. The proposal has been received with a good deal of favour on both sides.

In the discussion on the revision of the *British Pharmacopœia* at the annual meeting of the British Medical Association, Dr. Donald MacAlister announced on behalf of the Editing Committee that the metric system would be introduced into the forthcoming edition. To facilitate transition, in the pharmacopœial article the official proportions will be given in the familiar British measures as well as metrically. In all gravimetric and analytical operations, however, the metric system alone will be made authoritative.

THE CHOLERA.

CHOLERA is reported to be prevalent at Tientsin and Chefoo. Ten days' quarantine has been imposed at Cyprus on arrivals from Cape Khelidonia to Beyrout exclusive, unless they had undergone quarantine at an intermediate port, and had clean bills of health.

"IT ALL GOES OFF IN THE BAKING."

THE secrets of the baking trade are manifold, and as one by one they are made public our faith in the pastrycook is not enhanced. From the reports in the *St. James's Gazette* of a case tried at the Lambeth police court it appears that damaged tinned milk is used up in the making of pastry. The inspector, finding the milk in a very decomposed state, asked the defendant whether he thought the milk was fit for use. The defendant thereupon took up a piece of pastry for the witness to smell, and exclaimed, "Oh! it all goes off in the baking." This is purification by fire with a vengeance. We have long known that curiously stale eggs were used by pastrycooks: lately, in fact, the practice has sprung up of importing from abroad contents of eggs instead of the eggs themselves, the whites and yolks all mixed together being sent over in closed canisters. It is easy to imagine the mustiness of this egg mixture by the time it reaches its destination in the kitchen. We suppose, however, it also

"all goes off in the baking." At any rate, in regard to milk such seems to be the expert opinion, for the pastrycook, in answer to the magistrate, is reported to have said that "a little bad milk would bake out," while his foreman stated that, "In the event of one tin being slightly 'blown,' it would bake out;" to which Mr. De Rutzen made the obvious comment, "Then of course you wouldn't mind putting it in?" In the end each defendant was fined £10 and costs, which from the consumer's point of view is satisfactory.

THE SURGERY OF WAR.

THE interesting address with which Sir William Mac Cormac opened the proceedings of the Section of Surgery showed how important it is, from a humanitarian as well as from a surgical point of view, that a definitive solution of the question as to the effects of the new magazine rifles should be speedily arrived at. When war broke out in the East an experienced officer of the Army Medical Staff—Surgeon-Colonel William Taylor—was deputed by the Government to accompany the Japanese army for the express purpose of studying the medical aspects of the campaign in general and this matter of the wounds made by the new bullets in particular. As Surgeon-Colonel Taylor has lately been appointed Principal Medical Officer at Dover, it may safely be assumed that his report has been sent in to the War Office, and its publication will be looked forward to with interest, not only by army surgeons and by the medical profession generally, but by all who are interested in the welfare of our soldiers and in the mitigation of the horrors of war. It is to be hoped that the prolonged incubation period generally considered necessary before such departmental reports are allowed to see the light may, in this special instance, be shortened as far as the exigencies of red tape will allow.

COLOUR BLINDNESS AND COLLISION.

IT will be remembered that on February 1st a deputation of ophthalmologists waited on Mr. Bryce, then President of the Board of Trade, to urge the adoption of more trustworthy tests of eyesight in the examination of seamen and railway servants. Mr. Bryce maintained that his department "had shown due diligence in dealing with the matter," whereupon Mr. T. H. Bickerton pointed out that the "diligence" of the department to which is entrusted the safeguarding of the travelling community by land and sea had manifested itself first in refusing to allow that colour blindness was a practical danger at all, though it had been urged by the medical profession since 1855, and subsequently, when compelled by the logic of facts to abandon that untenable position, in stubbornly resisting every effort to eliminate persons of defective vision from serving on our railways or the mercantile marine. Mr. Bickerton challenged the Board of Trade to mention one single case of the many thousands that had occurred in which, after a collision, the Board had ordered an examination of the surviving officers and look-outs. A striking proof of their negligence in this particular occurred soon after the interview referred to in the disastrous collision between the *Elbe* and the *Crathie*. In a paper dealing with the question of eyesight in seamen and railway servants, which was presented to the Section of Ophthalmology at the recent meeting of the British Medical Association, Mr. Bickerton read a letter dated May 20th, from Mr. Bryce's secretary, in which it was stated that "the question of the powers of vision will be carefully borne in mind in the Board of Trade inquiry into the cause of the collision." The inquiry was duly held, but on writing again to the Board Mr. Bickerton was informed that "the witnesses were not examined as to their eyesight." The Board of Trade takes credit to itself for having asked the advice of the Royal Society on the question of colour vision, but beyond adopting the Holmgren wool test, it has done nothing to carry out that scientific body's recommendations. Mr. Bickerton went on

to show that by the use of inadequate tests applied after years of service, instead of at the outset of the sailor's career, incompetent men had been foisted on the public as competent, and the cruel custom had been followed of granting certificates which, on the introduction of reliable tests were rendered valueless to the possessors. In this way men had, through no fault of their own, but purely owing to the disgraceful negligence of the authorities, been deprived of their means of livelihood at a time of life when it was too late to adopt another calling. Mr. Bickerton cited some melancholy instances in which the accidental discovery of colour blindness—which, by a proper examination would have been detected before the man had definitively taken up a seafaring life—had led to mental derangement and attempts at suicide. The reading of Mr. Bickerton's paper was followed by the passage, on the proposal of Dr. Farquharson, M.P., of a resolution that the matter should at an early date be brought to the notice of Parliament, which should be asked to insist that adequate tests should be compulsorily applied before a lad is apprenticed to the sea; that the Royal Society's recommendations should be acted on by the Board of Trade in their entirety; and that officers already holding certificates, and now by the institution of adequate tests found colour blind should have shore berths given them in Government offices. The matter is one of such vital importance to the safety of the public that a heavy moral responsibility will lie at the door of the Government if it shirks so obvious a duty as that of compelling railway and shipping companies to adopt the elementary measures of precaution that have been pointed out.

DIPHThERIA AND SPEAKING TUBES.

Dr. KING WARRY, the health officer of Hackney, in reporting on the past year, produces a report made to his vestry on an outbreak of diphtheria and sore throat affecting the *employés* of a particular establishment in the district. Of the 150 *employés*, 43 were girls working in one room, and of 25 cases of diphtheritic illness coming to light, 22 were among these girls. The disease was probably introduced, and spread from one to two others of three girls sitting near together, all of whom frequently made use of the speaking tubes. They were, indeed, specially set apart for such use of the tubes, though many other girls at times did likewise; and the only other inmates of the establishment affected outside this room were one assistant on another floor whose duty it was to use the other end of one of these tubes, and two additional assistants in yet another room, who frequently came in contact with the girls of the invaded room in the lavatory, and who used the same towels. To these two causes Dr. Warry ascribes the spread of the disease, namely, common use by the infected and healthy of speaking-tube mouthpieces and the use of towels and lavatory accommodation in common.

HIGHER CLASS OFFICIALS FOR POOR-LAW INSTITUTIONS.

HARDLY a week goes by without affording fresh instances of the need of some radical change of the governing body immediately controlling the metropolitan Poor-law institutions. A few days ago the kind of work that the Hackney Board obtains from its officials was illustrated by one of its nurses, who, being sent in charge of some children with eye affections whom she was told to convey to Moorfields Hospital, left them at Liverpool Street Station while she went to spend the day with some friends, not returning until 10 o'clock at night, the semiblind children having in the meantime been conveyed back to the school by some railway Samaritan. Such a display of indifference to the children and want of conscience towards her employers should, in our opinion, have been punished with immediate dismissal, but the lenient guardians contented themselves with suspending the delinquent officer for a month. Evidently the Gillespie epoch still prevails in the Brentwood schools. This week

an inquiry has been held by the Local Government Board into the conduct of the master of the St. George's, Blackfriars, Workhouse, who it is alleged had neglected his duties—taking leave of absence for days together—had ignored or disobeyed the instructions of the medical officer, and had not conformed to the dietary table. Besides these charges, sundry others were preferred relating to accounts of supplies and waste of material. As usual, the inspector of the workhouse was appointed to be the judge in the inquiry, a position which, as we have frequently pointed out, is one that it is unfair to expect the same gentleman to fill judicially, and one that he would not be called upon to fill if some plan such as we have frequently urged could be carried out, which would place all the metropolitan Poor-law institutions under one central Board. This suggestion has also been adopted by our able contemporary the *Daily Chronicle*, which, in commenting on the education of the children of the State, advocates the formation of a strong representative central Board, by which a wide public opinion could be brought to bear upon the management of this vast and difficult office of public charity. At present the local Boards are too small to attract helpful criticism and too local to call for metropolitan interference, but a central body would be strong enough to deal effectively with the Gillespie incidents, and powerful enough to attract a higher class of persons than can be expected to take office under the petty governors of local Boards.

PUBLIC MEDICAL APPOINTMENTS.

It is an almost invariable rule in this country, and the result in many instances of express statutory enactment, that the public appointments open to the medical profession should be held only by those who are qualified to practise both medicine and surgery; and we therefore learn with considerable surprise that this very salutary regulation has not, according to the *Fremantle Messenger* (Western Australia), been followed in that colony. It is reported that the Government, "for some wise though presently hidden reason," have rolled into one all the public offices connected with the faculty at the port and have appointed a gentleman who, it is alleged is not legally qualified to practise surgery, as surgeon to the prison, resident medical officer at the port, health officer, and medical officer for Retinists. To appoint to the office of prison surgeon a person holding no diploma in surgery would appear exceptionally incongruous; and if the report in the *Messenger* were less authoritative, we should expect, as we still wish to find, that there has been some misconception on the subject. It would be a matter for deep regret that there should be any departure in the colony from the established regulations which obtain in this country in reference to these appointments, and which have proved to be beneficial in the public interest.

THE GROWTH OF CHILDREN.

Our great residential or boarding public schools afford opportunities, hitherto neglected, of conducting uninterrupted courses of observations on the growth and development of boys under normal conditions. The question has for several years engaged the attention of several German physicians, especially Mallin-Hansen, Schmid-Monnard, and Goppel, but almost exclusively on the children of the working classes, and especially as testing the effect of the "Ferien-Colonien" on the weaker individuals. On one point all are agreed—and it would be interesting to know whether this phenomenon is exhibited by all children, or is connected with the special conditions of the poor—that their growth is subject to variations not only seasonal, but even from day to day, dependent on the weather and temperature, or in other words on the influence of temperature and life in the open air on metabolism, nutrition, and heat production. Individuals may sometimes be observed to gain or lose as much as ½ kilo. in a single day, but if the mean of twenty or more children be

taken, the limits will be for boys 200 grammes, for girls 110 grammes, more or less. An appreciable gain of weight follows several consecutive days of warmer, and a loss the same of cold wet weather, though in neither case much exceeding 200 grammes with children in good health, and not recently recovered from illness. Dr. Goepel found that increase in height took place during the first eight months of the year, that is to say, it was slower in winter; and the gain in weight rose in summer, culminating in the August holidays, and declining during autumn and winter until in February it was nil, and in March even a loss of weight could not infrequently be observed in perfectly healthy children. These facts, he points out, must be taken into account in estimating the effects of change of air, etc., during the holidays, or of other changes of diet or habits. C. Roberts, E. Galton, and others have determined the annual increase in height and weight of boys and girls chiefly among the middle classes, but we may quote Dr. Schmidt's figures for children in German elementary schools, which are as follows: Girls from 7 to 10 years of age gain about 1 to 1½ kilo., and from 11 to 14 years 2 kilo. per annum. Boys of 6 years 1½ kilo., from 9 to 12 years 2½ kilo., and in the 13th year 3½ kilo.

"A REAL MEDICAL TRIUMPH."

UNDER this title the *Pall Mall Gazette* of August 12th descants on the surgical treatment of laryngeal tuberculosis as practised by Dr. Heryng, of Warsaw. We suppose we ought to be thankful to find one evening paper which does not speak of the operating room as of a shambles, to which the poor victims of vivisectioning surgeons are brought like lambs to scientific slaughter. We should have been better pleased, however, if our contemporary had sung its *Te Deum* in a key less jarring to the professional ear, and with less of a *puffando* movement, if we may be allowed to add a word to the terminology of journalistic vocalisation. The injudicious admirer is a sharper thorn in the flesh even than the candid friend, and to judge from the frequency with which Dr. Heryng's praises are hymned in Polish newspapers, that gentleman suffers from this affliction in a very marked degree. The pity of it is that Dr. Heryng's scientific wine is of a quality that needs no bush, and he may with justice complain not only that it is advertised to the public in this questionable fashion, but that it is adulterated by the journalistic middleman in such a way as to make it dangerous to the consumer. To drop metaphor, the *Pall Mall Gazette* has, of course unintentionally, presented the facts of the case in a way likely to mislead the reader who has no special knowledge of the subject. It is true that Dr. Heryng has been the pioneer of the treatment of laryngeal tuberculosis by excision, and it is true that in his hands and in those of other specialists this method has, in a limited number of cases, given excellent results. Dr. Heryng is therefore fully entitled to the credit of having made an important addition to the resources of the healing art in dealing with a deadly and previously intractable disease. It is not true, however, that the scraping away of diseased tissue from the larynx "cures" tuberculosis, and it is still less true that the method could be applied indiscriminately "even in hopeless cases." All that can be done by it is to suppress one local manifestation of a peculiarly infectious constitutional disease; the most thoroughgoing destruction of the laryngeal lesion, however, does not afford the slightest guarantee that the disease may not recur in the larynx perhaps in the scar left by the operation—or break out in the neighbourhood of that organ or elsewhere. The treatment finds its legitimate application only in cases in which the disease is strictly localised, as in the interarytenoid space, where a very small tuberculous ulcer will give rise to great pain in swallowing. This symptom can be relieved by removal of the cause, and if the infection has not extended beyond the site of operation there

is a chance, though by no means a certainty, that the patient may remain free from disease. To attempt to remove tuberculous lesions by scraping when the larynx is extensively invaded is but too likely to increase the sufferings of the patient and hasten the spread of the infection. To speak of "numerous cases" being "cured," therefore, is simply an abuse of word. A psalm is sung in honour of Dr. Heryng's twenty successes—and with a certain "mitigation of voice," as Malvolio says, we are willing to join in the chorus—but what of his failures? He would, we feel sure, be the first to acknowledge that for one case in which he has been victorious he has suffered defeat in many. One success, however, makes a far deeper impression than any number of failures, and only the initiated know what an effect can be produced by one or two show cases which are trotted out before societies and taken about to congresses, and are thus made to do duty like the couple of "supers" of a stage army. Another point on which the article in the *Pall Mall Gazette* is likely to convey an erroneous impression is as to the pain of the operation, which is minimised to a degree which the facts are very far from warranting. Mysterious hints are thrown out here and there as to the opposition which the method meets with in certain quarters; of this we know nothing. The operation is practised in suitable cases by specialists in this country, and with a success which there is no reason to believe inferior to that of Dr. Heryng himself. What we do oppose and protest against most strongly is that medical subjects should be dealt with in the lay press by imperfectly informed or wrongly inspired scribes, and that a class of sufferers especially prone to ill-founded hopefulness should be cruelly deluded by exaggerated and misleading statements.

THE MASSACRE OF MISSIONARIES IN CHINA.

It is melancholy to reflect that while Dr. Smyly, of Dublin, was participating in the business and pleasures of the annual meeting his sister, Mrs. Stewart, and her children were the victims of the horrible massacre at Whasang. On that terrible 1st of August he was present at a large luncheon party at Sir William Priestley's house, and in the evening he went to the Ladies' reception at the New Gallery, unconscious of the awful fate which had befallen his sister that very day.

THE LADIES' RECEPTION ROOM AT THE ANNUAL MEETING.

THE ladies' reception room at the recent meeting of the Association was so excellently arranged that some details on the subject may be interesting. The Council of the Royal Society having placed their rooms on the ground floor at Lady Priestley's disposal, the Treasurer, Sir John Evans, the Hon. Secretary, Professor Michael Foster, and the Secretary, Mr. Rix, proved themselves most anxious to make everything pleasant and easy for the ladies. With the personal goodwill of the Fellows and officials of the place, the solemn lecture room was soon transformed into an abode of light, luxury, palms, and art needlework. When Professor Michael Foster dropped in to see that the ladies had all they could wish for he was fairly dazzled by the gay aspect of the rooms. In the one sat the lady secretaries busy at work, in the other rested the busy sightseers. Not satisfied with granting the ladies the ground-floor rooms the Professor had given directions that the visitors were to be shown the great library and all the interesting relics it contains. A group of visitors immediately took advantage of this, and were personally conducted by himself. On the Thursday H.R.H. Princess Christian honoured the rooms with her presence, and was received by Lady Priestley (President), Lady Reynolds, Lady Broadbent, Lady Duckworth, Mrs. Andrew Clark, and other ladies who happened to be present. As Hon. President of the Ladies' Committee she was greatly pleased with the arrangements, and was

much amused to find that a footstool which had been hastily prepared for her use consisted of two volumes of the *Philosophical Transactions* tied into a piece of carpet and fastened with a string. Such a thing as a footstool proper was not to be found in the place, but the one extemporised did very well, Her Royal Highness remarking she had never had such a learned footstool before. After tea she went over the library, and was greatly interested to see the relics of Sir Isaac Newton, the germs of the first telescope, the first Davy lamp, etc. During the four working days of the meeting 508 cards of admission to the Ladies' Reception Room for the week were issued. It may be added that the ladies' evening party at the New Gallery was a most brilliant affair. Through the influence of Mrs. William Playfair the rooms were placed at the ladies' disposal by Mr. Comyns Carr and Mr. Charles Hallé. The Blue Zouave Ladies' Orchestra provided the music, and the arrangements generally were very complete.

DRINKING TROUGHS AND GLANDERS.

NOTWITHSTANDING the public attention and action of the London County Council which have been directed to the suppression of glanders amongst horses in the metropolis, official returns show that the disease continues to be "prevalent" without convincing evidence that the measures adopted are likely to eradicate it. Among the factors which are credited with favouring its existence and spread are the open drinking troughs erected by the Metropolitan Drinking Fountain and Cattle Troughs Association. A contemporary announces that the Vestry of St. Pancras, in which parish there are fifteen open drinking troughs, have requested the Association to erect standpipes in their stead. The Works Committee of the vestry have received a deputation from the Association which expressed regret at the suggested alteration, on the grounds of the expense and obstruction which watering animals from pails would entail, and denied that the troughs spread glanders. The vestry, however, are firm in the conviction that, from this point of view, the troughs are dangerous, and refuse to modify their resolution in any way. In this view the vestry is supported by the Master Carmen's Association and by the action of many of our largest horse owners, who supply pails for the purpose of watering their animals from standpipes so as to avoid chance of contamination from a common drinking place. Though opinion among veterinary authorities may not be unanimous as to whether horses are more commonly infected through the alimentary or respiratory passages, there can be no question that the virus may gain admission by either or both. There is as little doubt that the nasal discharges of an affected animal contain the virus, and but casual observation is sufficient to prove that nasal mucus is a common constituent of the contents of the open drinking trough, while the spread and maintenance of the disease in studs have been clearly traced to the practice of watering horses at the common trough in private stable yards. One can but respect the sentiment which would supply our thirsty animals with the means of quenching their thirst; but though the places provided are perhaps not the most important factors in the spread of glanders, it is passing strange that a philanthropic body exercising itself in this direction should deny that such a danger exists. Want of funds and the obstruction caused by standpipes may be legitimately urged perhaps, but the Vestry of St. Pancras are to be congratulated on their decision. The subject of glanders has considerably exercised the London County Council, who have given some show of a desire to eradicate from the metropolis this equine scourge, which also menaces human life. In order to effect this attention must be directed to the danger from open water troughs. It may be argued that it rests with horse owners to avert their losses at least by providing pails to be used at standpipes, which now exist in some parts of London, but it is a well-known fact that while

open troughs exist drivers, to avoid personal inconvenience, will disobey the strictest orders, and submit their own animals to the risk and the public to the danger. Happily our views of duty to the lower animals leave no question as to the necessity for providing, as far as we can, for their comfort, but this must be done with the smallest possible risk. It would be cruel to deprive our horses of the means of quenching their thirst: it is surely the duty of our central authority to see that this is done at the smallest expense to the community. It is possible that there may be a median course between the open drinking trough as now arranged and the standpipe. A place so arranged that one horse only at a time could drink from a trough whose supply was replenished from below and whose overflow could be rendered immediately inaccessible to the next would minimise the risks by carrying away mucus, etc., containing the virus from affected animals, but details are for the central authority which must sooner or later take the matter in hand. Without any feeling but that of gratitude to the benevolence of those who founded and have carried on the work of the Cattle Drinking Troughs Association our advance in human sentiment and social economy demands that the carrying out of such matters should be the duty of a public not a private body.

GRANTS TO PUBLIC VACCINATORS.

THE lay press appears to have recently got hold of the idea that some change of front has been made with regard to the granting of awards to public vaccinators, inasmuch as a decision of the Local Government Board is referred to as to granting such awards only when vaccination has been performed "from arm to arm." We cannot see in this attitude any change of practice, in view of the fact that the Board in question has always looked askance upon vaccination performed with stored lymph of any kind. Its rules and regulations have ever aimed at the maintenance of vaccination with fresh lymph, and have laid down the maxim that any other method of vaccinating should be the exception to be employed in such cases only as render really necessary a departure from the undoubtedly preferable manner of use of lymph in a perfectly fresh state. Judging by analogy we should imagine the Board would look with equal favour upon arm-to-arm and calf-to-arm vaccination, the storage of lymph being the one thing to be avoided.

ANTITOXIN AND DIPHTHERIA STATISTICS.

MR. JOSEPH COLLINSON, writing from the Humanitarian League Office, has sent to the press the following statement: "The Registrar-General has the following in his return for the week ending July 6th: 'The deaths from diphtheria in London, which had been 45, 37, and 38 in the preceding three weeks, rose last week to 53, which is higher than the number in any week since last December.' There is no proof here that antitoxin is of any value. If there is a shadow of a shade of proof anywhere that it is of the smallest value, I should be glad to have it pointed out. Will anything be done with the experimenters who have tried at their will their 'immature practices and fantastic theories' on the unfortunate patients in our hospitals since December last?" Mr. Collinson, it will be noticed, makes the tacit assumption that all, or nearly all, the cases of diphtheria occurring in London during the week ending July 6th were treated with antitoxin. For such an assumption there is no foundation whatever. As a matter of fact, there are no available data to show how many cases, fatal or not, were treated with this particular remedy during the week in question. There is, however, reason to believe that outside hospital practice antitoxin has been, and is being, but little employed; at any rate in those parts of London and amongst those classes of society which furnish most of the patients. The majority of the cases treated in hospitals are treated in the institutions of the Metropolitan Asylums Board; yet these institutions do not receive half the cases noti-

fied. For instance, during the year 1894, 10,655 cases of diphtheria were notified, and during the same period 4,014 cases were admitted into the Board's hospitals. So, too, as regards the deaths; of 2,670 deaths from diphtheria occurring in London during 1894, 1,036 took place in hospitals of the Board. Under such conditions, therefore, it is possible for antitoxin to be a remedy of value, and yet for its value not to appear in the Registrar-General's weekly returns. The mere statement that 53 persons died of diphtheria in London during any particular week is no argument against the value of the antitoxin or any other method of treatment. During the fortnight ending July 6th there were 91 deaths from diphtheria in London, and during nearly the same period of time—the fortnight ending July 4th—there were 494 cases notified; so that with very slight error it may be stated that the case mortality was about 18 per cent., which is lower than it was for 1894, when it was about 25 per cent. (10,655 notifications with 2,670 deaths). Mr. Collinson may be allowed the full benefit of his assumption, yet he fails in his argument. For the proof of the value of antitoxin, as far as it has been tried, he may be referred to the pages of the *BRITISH MEDICAL JOURNAL*.

WOOD PAVING.

MR. WYSTER BLYTH has presented a report to the Marylebone Vestry on the result of some inquiries he has recently made with a view to clearing up the question of the alleged harmful effects produced by the use of wood paving. Mr. Blyth starts by accepting the statement that wood pavement, especially old wood pavement, smells; and he has attempted to ascertain whether the smell comes from the surface or whether the blocks of wood are saturated with impurity throughout. With this object in view he has estimated the quantity of ammonia obtainable from the top slice, middle slice, and bottom slice of two wooden blocks (one taken from the centre of the roadway, the other from the channel of the roadway in Oxford Street). In the block from the centre of the roadway most ammonia was found in the top slice, the amount decreasing on proceeding from above downwards; in the other block the reverse condition was found, most ammonia existing in the bottom slice and least in the top slice. Mr. Blyth explains this phenomenon on the ground that water percolates through the interstices of old wooden blocks on to the impervious sheet upon which they are imbedded, and gravitates to the channels, thus saturating the bottom slice of the channel blocks. Mr. Blyth is unable to confirm the view that ophthalmia and throat affections are caused by emanations from wood paving; he says, however, that he cannot absolutely deny that such is the case. He prefers asphalt to wood paving, and thinks that when compressed air and electricity replace horses, and when therefore the clatter of hoofs can no longer be objected to, asphalt paving will be likely to be regarded as distinctly the most suitable form of covering for the streets of towns.

SCHOOL BOARDS AND MEDICAL MEN.

IN answer to a question by Mr. Athelstan Riley, at a recent meeting of the School Board for London, Mr. Sharp (Chairman of the School Accommodation and Attendance Committee) said: "From the extract which Mr. Riley gives from the *BRITISH MEDICAL JOURNAL* it is self-evident that it must have been written in ignorance of the real facts of the case, which I have endeavoured to set forth more than once." Poor Mr. Sharp! It is very sad when a man has endeavoured to set forth the "real facts" (*sic*) of a case, even more than once, and has so failed that his critics still remain in ignorance of them. Yet, until Mr. Sharp can manage to give a more explanatory answer than this accusation of ignorance on the part of his critic with which the School Board had to be content as an answer to a proper question, the public will believe what is a very "real" fact—namely, that when we wrote we knew. The facts are extremely simple. The School Board officials,

being dissatisfied with some of the medical certificates which they received in explanation of the absence of children from school—certificates which they ask for, but for which they decline to pay, have obtained permission to appoint in certain districts medical men whose duty it shall be, when certificates are considered by the school officials to be unsatisfactory, to investigate the cases, visiting the houses and if possible seeing the children, ailing or not as the case may be. For this they are to be paid a fee, and at present the number of cases so investigated is to be limited to a certain number per annum. No suggestion is made of any consultation with the medical men in attendance. These School Board spies are merely to go and find out the actual condition of affairs (as it appears to them, poor souls! who have never seen the case before and know nothing whatever about it), and report to their masters. This is what we called an "intrusion" of the official between the medical attendant and his patient. We are quite aware that since the passing of the resolution it has been explained that the great mass of the cases so investigated have been cases in which the certificates had been given by unqualified persons, thus showing the aptness and propriety of the amendment moved by Mr. Riley at the time, but the fact remains that the Board have sanctioned the appointment of these medical men for the purpose, among other things no doubt, of inquiring into the correctness and sufficiency of certificates given by other qualified medical men, and that they have ordered the names of the men they have so appointed to be sent to the magistrates in each district, apparently with the view of letting them know whose evidence they ought to accept, a proceeding which we should imagine is well calculated to "put up the backs" of these gentlemen, who have been sufficiently worried already by the repeated petty prosecutions by the School Board officers. Our advice to medical men, in districts where these offensive appointments have not been made, is that they should give careful, honest certificates, such as they could at any time swear to in a court of law, but that, in those districts in which the School Board have appointed medical spies, they should give no certificates at all. The Board has in those districts accepted the responsibility of deciding who is medically fit to go to school; let them and their officials decide it, but let the doctors, for the protection of their patients against an insolent and overbearing officialism, always be prepared to go into court to give evidence for those against whom unjust charges are brought. If they do that the School Board will soon tire of paying costs.

THE VACCINATION ACTS.

MANY suggestions have been made with the object of more effectually carrying out the Vaccination Acts, and more effectually ensuring the complete vaccination of the people. Among these is a plan proposed by Dr. Garret Horder, public vaccinator at Cardiff. He is strongly impressed with the imperfect manner in which the operation of vaccination is performed by many private practitioners, and he quotes from Dr. Barry's report on the Sheffield epidemic of 1887-88, to the effect that of eighteen private practitioners whose work was specially inspected, that of eight only came up to the Government standard, whilst that done by four would have been classed as second grade, and the work of six as wholly unsatisfactory; and that, as a general thing, while the vaccination habitually performed by many private practitioners was of uniformly high class, the majority of private vaccinations which came under his notice were very much below the Government standard. Under these circumstances Dr. Garret Horder proposes to disestablish and disendow the private vaccinator, to take vaccination away from private practitioners, and place it in the hands of medical men who shall be appointed by the Local Government Board, and who shall, moreover, undertake not to practise their profession in any other way whatever. These medical men

world, in fact, become officials of the Local Government Board, and be paid by them. As a natural corollary of this comes the transfer of the administration of the Acts from the Boards of Guardians to the Local Government Board. It is obvious that, to put this scheme in force, a complete alteration of the Acts as they stand would be required. Then, in view of the facts stated in regard to the high character of the work done by the public vaccinators, who in the instance quoted did 83 per cent. of all the vaccinations, no reason appears unless it be a feeling of despair at the present condition of affairs for depriving them of work they evidently do so well. As regards private vaccinators, they undoubtedly often vaccinate badly; but as to disestablishing and disendowing them, they are neither established nor endowed at present, no influence in the way of deprivation of fees can be made to touch them; and if they are to be prevented from vaccinating their own patients, the act of performing even efficient vaccination by anyone except an official must be made a misdemeanour in the eye of the law. Are we prepared for that? Again, are we prepared to make the operation of vaccination such a speciality that a man shall be asked to devote his life to it? If we are, we must be prepared also to see the performance of the operation drift out of professional hands, for the public will not be slow to assert that a complete professional training is unnecessary for a man whose whole duty is to insert the vaccine, and who has nothing to do with the case either before or after. These are matters worth careful consideration before adhesion is given to a plan which, although put forward with the best of motives for the remedy of an undeniable abuse, entails difficulties which cannot be shirked. Nor does there seem to be much need for so radical a change. Once so modify the law that guardians shall be compelled to do their duty, and once obtain such a definition of efficient vaccination that those who give false certificates may be prosecuted, and the existing Acts would become again effective. Of the present evils, however, we have no doubt; and so long as guardians refuse to administer the law, magistrates refuse to convict when the law is broken, and doctors give bogus certificates after imaginary vaccinations, so long will small-pox repeatedly crop up, and become—as it always does when it is epidemic—a terror in the land.

SMALL-POX IN SALVATION ARMY SHELTERS.

We have already referred to a report by the Medical Officer of Health of St. George, Southwark, in which he stated he had found that a number of cases of small-pox which had recently come under his notice were traceable to infection from a man who had been sleeping at a Salvation Army shelter in Blackfriars Road. It appears that several cases of the disease have also been observed at the Whitechapel Infirmary in persons coming from a Salvation Army shelter in Whitechapel. The spread of small-pox among vagrants excited considerable attention two years ago, and was the subject of an exhaustive report by Dr. Armstrong, of Newcastle, and as the outcome of his investigations a conference of members of local authorities was held at the County Hall, Spring Gardens, in July, 1894. The first resolution adopted by the Conference was to the effect that "common shelters which are not subject to the law relating to common lodging houses should be made subject to such law." The behaviour of small-pox in London at the present time certainly affords further proof of the need for carrying this necessary reform into execution.

MEDICAL FEES IN DUBLIN.

THE Recorder of Dublin, in an action lately brought before him for recovery of fees for professional services rendered by Dr. White to a grocer, is reported to have said that "he had been battling all his life, and would continue fighting as long as life would last, against the profession to which Dr. White belonged." This extraordinary statement was elicited from the learned judge after Dr. White had given

evidence that he had charged 6s. 8d. per visit, and £5 for a difficult operation—a by no means heavy or unjust charge. The Recorder further remarked that "in England, medical men of the highest grade attended poor people for fees of 1s. 6d. or 2s. 6d.," and that "in Dublin medical men would not attend for less than one pound." The evidence in the case by no means bore out this statement, as it was shown clearly that Dr. White was only charging at the rate of three visits for a sore throat. In the end the verdict was given for the plaintiff, but only for the sum of £1, instead of the £6 6s. sued for. It is high time that the profession generally made a stand against the rapid monetary depreciation of the value of its services which is passing over this country and is apparently extending now to Ireland. The influence of the medical aid societies is at work, and the wholesale "store system" of treating the sick with a "reduction of fees for taking a quantity" of patients is the origin of the depreciation. Ireland has now learnt on high legal authority that it has "another grievance," and will no doubt act accordingly.

THE POOR AND THEIR DOCTORS.

THE report which we publish in another column of the inquiry respecting the death of George William Clarke is a very startling one. According to the evidence, as stated in the report, Mr. Perdue, the unqualified assistant of Mr. Wilmer, a registered chemist and druggist, was in the habit of visiting patients gratuitously, with Mr. Wilmer's knowledge, and administering to them a medicine alleged to have been compounded of ten leaves. The Coroner seems to have treated Mr. Perdue as an harmless fanatic, ignoring the fact that his services would not have been asked for at all in the case which was the subject of the inquiry, had it not been for the fact that he was Mr. Wilmer's assistant, and that the parents of the child had called him in, on the assumption that he was a qualified medical man. It is also important to remark that, according to the evidence, when the child appeared to be dying, Mr. Perdue told the mother, or her sister, to put his medicine out of sight and send for a medical man, and not to mention the subject of his visit. That Mr. Perdue visited patients with Mr. Wilmer's knowledge must be either true or untrue. If true, Mr. Wilmer will no doubt be called to account by the Pharmaceutical Society. If untrue, the sooner Mr. Wilmer gets rid of his unqualified assistant the better. It seems, however, scarcely credible that the unqualified assistant could have been in the habit of paying visits to patients without the knowledge of his master, and it is equally difficult to believe that he should have paid them gratuitously, or that some benefit should not have accrued to him, directly or indirectly, from them. The attention of the Society of Apothecaries will doubtless be directed to the case, and if they consider that proceedings can be successfully instituted against Mr. Perdue, they will, we trust, commence them as soon as possible.

MILKBORNE DISEASE:

AN APPEAL TO MEDICAL OFFICERS OF HEALTH.

MR. ERNEST HART is engaged on a general inquiry into milk-borne disease since 1881, in continuation of his paper of that year on the Influence of Milk in Spreading Zymotic Diseases, and will be much obliged if those health officers who possess notes of outbreaks of disease traceable to the agency of milk will be good enough to furnish him with a brief statement of the facts, so far as known, in the shape of answers to the questions subjoined:

1. Date.
2. Locality.
3. Reporter.
4. Total number of cases.
5. Deaths.
6. Number of cases amongst drinkers of suspected milk.
7. Number of persons supplied by milkman.
8. Number of such families invaded.
9. Sanitary circumstances of farm or dairy from which milk was obtained.
10. Exciting cause of outbreak.
11. Circumstances implicating milk.
12. Facts showing special incidence of disease.
13. Reference to report.

WATERBORNE TYPHOID:

A HISTORIC SUMMARY OF LOCAL OUTBREAKS IN GREAT BRITAIN AND IRELAND, 1858-1893.

*A Report Prepared for the Parliamentary Bills Committee
of the British Medical Association.*

By ERNEST HART, D.O.L.,
Chairman of the Committee.

(Concluded from page 141.)

2. *Public Water Supplies.*—Here I touch upon a much larger question. It is one that has already received such extensive consideration at my hands that I hesitate to say much more upon it. But still I am persuaded that many points need to be treated under this heading before we can hope to see water-borne typhoid fever exterminated. One of the foremost questions of to-day is that of river pollution. The importance of freeing our rivers from their sewer-like condition is not to be gainsaid. A perusal of my summary tables will at once enable my readers to perceive the enormous interest which the public have at stake in seeing that our waterways shall be preserved from excremental pollution in so far as they serve as sources of water supply. A great stride has been made of late by the creation of joint committees for the prevention of such pollution. It is to be hoped that such bodies will be multiplied, and that they will aim at the greatest good attainable by securing the co-operation of all the manufacturers in the district within the area for which they have been appointed to act. Such bodies, if really in earnest, can, I am quite sure, do much to free our rivers from contamination. At present it is no uncommon thing to learn of towns drawing water for domestic purposes from a river which higher up is receiving the untreated sewage of a large population, and the trade effluent of manufacturing districts. I would have all waterways which are sewage polluted or rendered doubtful by the flow into them of trade refuse entirely done away with as sources of water supply. And again, I would wish to see the disposal of sewage enforced in such manner as to preclude the possibility of direct access of sewer contents to any river or stream that is not tidal. The Rivers Pollution Prevention Acts have been signal failures so far as their practical results show. If our rivers are to continue to serve our tables with drinking water, let them be absolutely free from the contents of our water-closets at any rate in their crude forms.

But I wish here to chronicle my desire to see the State stepping in and enforcing that the sewage of all towns shall be so carried out as to avoid contravention of the Rivers Pollution Prevention Acts. I do not think the State should in anywise countenance the disposal of sewage in a way likely to render these Acts inoperative in any sanitary district. Either let our rivers and streams be kept from all manner of pollution, or let them be frankly held to be unsuitable for purposes of drinking water, even after filtration. Engineering experts tell us that the effluent of sewage matters can be rendered safe for the purposes of ingress to our waterways; then by all means let the country see to it that our rivers be no longer allowed to remain common sewers.

There seems to be no safe middle course. While rivers and streams are thus dealt with, let all use of canals for drinking purposes be also absolutely prohibited. The gross sources of pollution to which they are subjected speak for themselves; for not only are they the receptacles of all sorts of abominations from the banks, but they are open to extremely dangerous contamination by means of the immense floating population always rearing upon their waters. The same may be said of many of our navigable rivers.

Equally open to pollution are only too many of the gathering grounds of our public supplies. There can be no excuse for the delivery to the distributing mains of water drained from a catchment area on which are situate villages and other aggregations of populations, with their varying methods of excrement disposal, such as midden privies, cesspools, and

even sewerage systems, inclusive of direct disposal of crude sewage on land draining to the storage or service reservoirs. Yet such things are happening to-day in our land. We find such other elements as churchyard drainings, heavily manured fields with natural drainage to the water conduits, and the like. To my mind, all gathering grounds should be freed from anything worse than the mere droppings of pastured animals, since whilst we permit manure, often of human origin, to be deposited within the catchment area, and excrement disposal such as is incidental to populations in villages, farmsteads, and so on, to persist in positions whence they assail the purity of our drinking water, we wilfully court disaster. Where public supplies are in the hands of corporate sanitary bodies the question of gathering grounds is made easier than where companies are in possession of the works. And for this and many other cogent reasons, I would see the way made smoother for enabling sanitary authorities to purchase such works. At present, Section 52 of the Public Health Act, 1875, is so encumbered as to be virtually a dead letter for the purpose of freeing sanitary bodies from the necessity of taking water at the hands of any company that may chance to have rights of supply in their district.

Altogether, apart from the question of pollution of water services by viable media, there is the important consideration of the construction and method of laying water mains, especially where they come in close proximity to sewers. I would see much greater care bestowed on these matters than is seen by the pages of this report to have been the case in too many instances. Badly jointed mains may well become the receptacles of any filth that may happen to be in the neighbourhood, and it is well known that water mains, even when "running full," are able to take up extraneous matters by insuction. Where, then, sewers are placed close to mains, or the reverse happens, the most exceeding care should be bestowed on every detail to secure that the water shall be free from the possibility of sucking up the leaking contents of the sewers. When sewers are laid at a higher level than water pipes this care will have to be correspondingly still greater, not only in the first laying of the pipes, but in the maintenance of the plant. The relation of sewage to water used for domestic purposes does not, however, cease when the sewers have been properly laid and egress of their contents underground prevented in the proximity of water mains. There is the factor of disposal of the sewage to which I have already referred.

Before I leave the subject of water mains, let me say that I would like to see all bull hydrants done away with. They have more than once been seen to be associated with prevalence of typhoid fever in districts served by them, and they would, to say the least, seem to be a danger to the purity of the water, even if by no worse than road detritus, but, as we know, at times also by the contents of ashpits, privies, middens, and the like.

In the matter of filtration I am much afraid we come off very far short of that point of perfection to which it were well that we should attain. The theory now advanced concerning the filtering of drinking water, which cuts at the very heart of our preconceived notions as to the treatment to which our filter beds should be subjected, has also brought with it the statement of the only position which it is safe to adopt, if we are to be free from the danger of recurring outbreaks of typhoid fever by reason of our water supply becoming polluted in a manner not to be rendered harmless by our prevailing methods of filtration. To such of my readers as have not studied the paper of Professor R. Koch on Water Filtration and Cholera, I would say do so; and I would further lay stress on the rules which are therein laid down for the frequent and regular bacteriological examination of water from each separate filtering basin and before the water has been allowed to pass into the general storage reservoir, as also to the rule as to the construction of the filter beds in such manner that improperly filtered water can be at once removed not being allowed to mix with the other water to be delivered to the distributing mains.

I have previously stated the rate and quality of the filtration which Professor Koch would see universally adopted, and I need not here further pursue the matter; but I could

¹ Professor R. Koch on Cholera. Translated by Geo. Duncan, M.A. Douglas, Edinburgh, 1894.

wish to see our water companies and corporations appointing as their chief engineers men of standing in regard of bacteriology as applied to the examination of water. Much as I would like to dwell upon this important portion of my subject I must hasten on, leaving my readers to further study the current literature if they feel interested in the questions at issue.

WATER SUPPLIES TO DAIRY FARMS, COWSHEDS, ETC.

This is a matter of vital importance that cannot be well overlooked. The question of the water supplied to milch cattle by no means receives the attention which it undoubtedly deserves. It would seem to be the commonly accepted idea that cattle may with impunity be allowed to drink of any and every kind of water. It is not so. Evidence testifies to the contrary.

Mr. Shirley Murphy has stated, in a paper in the *Practitioner* in 1880, that he would like to see the drinking water of cows outside cowsheds from ponds fed by springs and fenced round to prevent fouling. So, too, I would wish to see care paid to the purity of the water with which cows are regaled, alike in the pasture and the cowshed. Indeed, the water furnished to housed cows is in need of much more careful supervision than is carried on. The cases which appear in my summary tables in which water-polluted milk has played a part in the dissemination of typhoid fever speak of the want of ordinary attention to the necessities of the case. The water supply of many of our country farmsteads is a disgrace to the land and a constant menace to the milk trade. But this is only one point in which much still remains to be done in the way of securing our milk from the potency of harm which frequently attaches to it, and must form the subject of another paper, seeing that the specific pollution of cans, milk, and other dairying plant and produce by fever-contaminated water is but one phase of the dangers to which milk is exposed. Suffice it that the exercise of a minute inspection of our dairy farms and cowsheds and milkshops is called for, and much more needs to be accomplished by our health officers and nuisance inspectors in the future than has been done in the past. Regulations have of late years been increasingly brought to the notice of sanitary bodies, but their adoption, and especially their uniform enforcement, have not been correspondingly in evidence. The relation of the milk trade to the public health is too intimate to admit of any half-heartedness in the method of control of the varying businesses connected with it in so far as the health of the community is affected or is at all likely to be affected.

CONCLUSION.

My task is now all but finished, imperfect though it be; but if it serve to impress upon our health bodies and the community the lessons which may be learned from the history of waterborne typhoid fever in our country, and if the lessons so taught bear fruit in the direction of added care to the important matter of water supplies, then my task will not have been undertaken in vain. But it cannot be too strongly pressed home that the future exemption from the disease much depends on the attitude of the people towards matters sanitary, since public bodies of whatever nature are after all but the embodiment in brief of the public whom they represent. It is undeniable that the public ear needs to be caught before any reforms can be carried out; and in matters affecting the health of the community the people need to be educated in no small degree, especially having regard to the fact that the public purse-strings are involved. If there be one point upon which misconception arises more than another, it is the supposition that money is wasted when it is spent on sanitary reforms which are not clearly indicated by the advent of absolute disaster as a consequence of their previous neglect. The lesson has still to be widely learned that the remedy of sanitary deficiencies, the provision of pure water, proper methods of excrement removal and disposal, and the adoption of all practicable means for the prevention and stay of infectious diseases, are among the most sound investments which can be made by the individual and the community. When any nuisance touches the welfare of any one person or household an outcry is at once made until the matter is settled; but where the health, and therefore the happiness, of a town is not seriously threatened in a

visible form, but is nevertheless endangered by the neglect to provide that which experience has shown to be essential to actual freedom from possible harm, then it is that the rate-payers often rise and protest against the expenditure of public moneys on a matter of "possible" concern for their health. But although this is so, still to some extent there can be no denying the fact that the people of England are awaking to some sense of their obligation to the advance of sanitary science for their present comparative exemption from the ravages of those diseases of a preventable nature from which our country has suffered in time past.

An apparent paradox has now been for some time promulgated to the effect that cholera in this country saves more lives than it costs, but the assertion is true. All sanitary measures that go to lessen the likelihood of cholera-spread go also to lessen the chance of spread of diseases which are disseminated in like manner to that plague, and typhoid fever is most certainly one of those diseases which are thus held in check. Yet when cholera threatens our coasts, there is but little difficulty in securing the co-operation of sanitary bodies and the public in carrying out those measures which are thought to be necessary. But it must be held in mind that cholera and typhoid fever are scarcely to be mentioned in the same breath for frequency of occurrence and wideness of misery and death arising therefrom. The latter disease yearly claims its thousands of victims to attack, and its hundreds of lives. Not so cholera nowadays; if half a hundred cases are heard of, and a dozen deaths are registered, the country is up in a state of panic, and the floodgates of suggestion and of costly piecemeal activity are flung wide. If the relative importance of the cost to the country year by year of these two diseases were any criterion of the attention to be paid to them, then we should have great hopes of seeing the time come quickly when typhoid fever would be reckoned as one of the scourges of a past generation; and its appearance looked upon in much the same way as cholera is now regarded.

But there is to my mind another side to the matter, and that is that if sanitary bodies are the representatives of the public they are also the bodies charged with administering the laws relating to the health of the community, and as such have a responsibility cast upon them of seeing to it that the laws are so administered as best to advance the interests of their constituents. To this end the State has sanctioned the appointment of sanitary advisers, and has also established its own health department. It will be well when our sanitary bodies see in its proper light the seriousness of neglecting this responsibility, notwithstanding that the rate-payers are averse on general grounds to the expenditure of money on measures of sanitary improvement. There are many ways in which these bodies can secure improvement in their districts without overburdening the rates, as, for example, by borrowing money with power of repayment in a number of years, so that interest and capital are in some degree paid by a succeeding generation enjoying the benefits provided by their predecessors. I regard the elementary matters of pure and adequate water supply, proper and sufficient sewers, and proper means of sewage disposal as essentials for every place of any pretensions to the name of town; whilst many rural districts possess aggregations of population for which they are none the less essential. I would see their provision enforced in all such places. Sickness is just as costly as cleanliness and much more disagreeable.

There is now an additional incentive to sanitary authorities to properly perform their statutory duties, seeing that county councils have at any rate got the power of calling upon the Local Government Board for inquiry where any district authority have made default in regard of their duties; and there can be no doubt that the power is no slight one, since the exercise of it may mean exposure to the public of the shortcomings of the health body, with possible outlay for work which could have been the more economically done by degrees when its necessity was first pointed out. There can be little doubt that county councils have in their sanitary officials a means of keeping them well informed as to the state of the administrative county, while the districts themselves will have the benefit of counsel from the county officials. I have already, in a paper which appeared in the *BRITISH MEDICAL JOURNAL* of July 15th, 22nd, and

29th, 1893, on the subject of extended powers needed by county councils, pointed out the directions in which those bodies could be made more useful still to the counties which they serve. It certainly seems that they are becoming alive to their position towards local authorities, and the stimulus thus given to those authorities will not be without its result on the healthiness of the country. The great lack of many of our county councils to-day is a medical adviser. The omission to appoint such needs to be rectified.

But there is still another body to which, after all, we must look for much that is to place our country on the basis of sanitary perfection to which we would all see it attain—I refer to the Local Government Board. The past amply testifies to the good work carried out by this State Board of Health. The influence on the present sanitary position of England of the action of this Board has been most marked. But even so, I do not think I shall err if I place the Medical Department of the Board in the foremost position, as having contributed to the advance made in the last twenty-five years. I need not here dwell on their achievements. I will satisfy myself by a reference to one piece of work undertaken during the last two years under threat of cholera invasion. The work was the special *Cholera Survey* of numerous sanitary districts throughout the country. The public press has amply demonstrated the help which this survey has been to the localities visited; and the mass of information got together at headquarters as a result of these local visits must be enormous. My chief reason for naming this matter is to ask the questions: Why a "cholera" survey only? Why not, indeed, a "sanitary" survey also? If the survey has, as we know it has in many cases, demonstrated the unreadiness of districts to resist cholera, why limit such a useful measure of supervision to cholera seasons, seeing that typhoid fever will spread where cholera can find a breeding ground? Is such a duty to be left to county councils, and if so will they perform it in a manner likely to prove generally useful? The State now has its regular school inspection, its periodical workhouse visitation, its biennial public vaccination inspection; why not its annual, biennial, triennial (or even its irregular, but constant) inspection of sanitary districts for the purposes of ascertaining the shortcomings and the remedial measures necessary in regard of the sanitary state of our country? And this not alone in England. Surely such a Governmental supervision of our local authorities would be a heavy lever in the hands of the State towards securing uniform cleanliness alike of air, soil, and water.

However it be accomplished, certainly it would seem to be of paramount importance that a country held up, and even holding itself up, as a pattern in matters sanitary, should strive to secure the prevention of preventable diseases, of which class typhoid fever is typical. It will undoubtedly be a costly piece of work, but the end in view more than justifies the adoption of the essential measures.

APPENDIX A.

DR. KLEIN'S BACTERIOLOGICAL EXAMINATION OF WORTHING WATER, 1893.

METHODS OF EXAMINATION.

(Appended to Dr. Theodore Thomson's Report on the Worthing Typhoid Fever Epidemic of 1893.)

The methods of examination reported to were as follows: With the view of ascertaining the quantity of micro-organisms per cubic centimetre of the water under investigation, the ordinary method of plate cultivations was employed. This plan consists of adding to nutrient gelatine in a fluid state a small quantity of water to be examined (the amount employed varying from 1 c.cm. to a fraction thereof), shaking the mixture so as to aid distribution of the water throughout the gelatine, and then pouring the mixture on plates. These plates, on which the gelatine mixture solidifies, are then transferred to an incubator, and maintained at a temperature of 30° C.; and by subsequent observation the number and nature of the organisms that grow on the gelatine are ascertained.

Another method was resorted to in searching for particular microbes in water from a given source, and for the following reasons:

(a) The bacillus coli and the enteric fever bacillus, when present in drinking water, exist there for the most part in relatively small proportion. Thus, if only a small quantity of water, such as 1 c.cm., be examined, it is likely that the organism, sparingly present in the total bulk of water, may not be present in a small sample, although present in a larger bulk.

(b) If the number of other micro-organisms amount to several hundreds or more per c.cm.—and this is usually the case when water is unfiltered—there is risk that the numerous colonies of these may on plate cultures obscure and prevent recognition of scantily present bacillus coli or enteric fever bacillus.

(c) One of the bacteria most frequently found in water is the bacillus fluorescens liquefaciens, which grows much more rapidly than either the bacillus coli or the enteric fever bacillus, and liquefies gelatine very quickly. Abundance of the first-named bacillus in the water under examination would accordingly, by liquefaction of the gelatine mixture, tend to prevent detection of either of the last-named bacilli. With the view, therefore, of overcoming these difficulties the following means were adopted:

1. A considerable bulk of water (from 1,500 to 2,500 c.cm.) was submitted to examination. For this purpose the quantity to be examined was passed through a sterile Berkefeld filter, which retained on its outer surface all or nearly all the particulate matter contained in the water. The matter thus retained on this outer surface was then brushed with a sterile brush into 20 c.cm. of sterilised water and mixed therewith. Of this mixture 1 c.cm. was added to each of a series of gelatine plates and broth tubes.² Accordingly these tubes and plates contained all or nearly all the particulate matter of the total quantity of water selected for examination.

2. To prevent obscuring of the bacillus coli or the bacillus of enteric fever by other organisms that grow more rapidly than they, or that soon liquefy the gelatine, a small quantity of phenol was added to the culture media. For this purpose a 5 per cent. watery solution of phenol was used, and this solution was added to the culture media in the proportion of 1 of the former to 100 of the latter. The added phenol, which does not interfere in any way with the growth and multiplication of the bacillus coli or of the bacillus of enteric fever, exerts a marked inhibitory effect on such water bacteria as bacillus fluorescens liquefaciens, the proteus vulgaris, and others; and, by retardation or suppression in this way of growth of these latter organisms, better opportunity is afforded of detecting in waters examined the presence of the bacillus coli or of the bacillus of enteric fever.

The gelatine plate and broth tube cultures thus prepared were incubated at a temperature of 20° C. and of 37° C. respectively. From growths of the bacillus coli or the enteric fever bacillus obtained in these ways subcultures were made in the ordinary manner.

Features characteristic of *Bacillus Coli* and of the *Enteric Fever Bacillus*.

<i>Bacillus Coli</i>	<i>Enteric Fever Bacillus</i>
Shorter and less mobile than the enteric fever bacillus.	Longer and more mobile than the bacillus coli.
Forms gas bubbles in gelatine shake culture.	Does not form gas bubbles in gelatine shake culture.
Curdles milk in 1 to 3 days at 37° C.	Does not curdle milk.
If grown in broth for several days forms indol.	Gives no indol reaction when grown in broth.

The above tabular statement embodies the chief distinctive features of the bacillus coli and the enteric fever bacillus, derived respectively from the contents of the healthy human intestine and from the tissues of enteric fever. Other points are as follows: In gelatine stab culture and in gelatine surface cultures these bacilli are alike in general appearance save in two respects, namely, (a) that the bacillus coli grows faster than the enteric fever bacillus, and (b) that in gelatine stab culture the former organism forms on the upper surface of the gelatine a larger plate-like growth than does the latter. On gelatine plates both organisms form on the surface of the

² Beef broth; alkaline; with 1 per cent. peptone and 1 per cent. salt added.

culture medium colonies which present the appearance of flat, crenated, or irregularly outlined patches, thinner at the periphery than at the centre, translucent by transmitted light, greyish by reflected light; while colonies of both organisms, growing beneath the surface and embedded in the gelatine, are rounder than surface colonies, and appear of a brownish colour by transmitted light. Neither organism liquefies gelatine. Their growth on agar and on potato affords no definitely distinctive feature; although, as a rule, the bacillus coli forms on potato a brownish growth, while the bacillus of enteric fever forms on the same medium a colourless growth.

THE SERUM TREATMENT OF TUBERCULOSIS.

The communication on the serum treatment of tuberculosis presented by Professor E. Maragliano, of Genoa, to the Section of Medicine has excited so much interest that we think it well to publish a full abstract of it here.

After alluding to the curability of tuberculosis as proved by the evidence of the *post-mortem* room, and after referring briefly to the endeavours of Richet and Héricourt in France, of Babes in Hungary, and of Paquin in America, to discover an antituberculous vaccine, he submitted his own researches which had been pursued for three years, and which had resulted in the discovery of a serum having a specific curative action on tuberculosis, that is to say, a serum presumably containing tuberculous antitoxins. This serum he has obtained from dogs, asses, and horses, "by procedures different from those hitherto adopted, absolutely disregarding cultures of living bacilli, and availing myself exclusively of the highly toxic principles extracted from these." By progressive vaccinations dogs are immunised against intravenous injections of very active tuberculous matter taken from the human subject. As the result of experiments to determine the potency of this serum, he has found that on injecting tuberculin together with a sufficient quantity of the serum into a tuberculous subject no reaction, either general or local, takes place, whereas the same quantity of tuberculin injected alone produces both general and local reactions. Professor Maragliano considers that the capacity of a serum to neutralise the toxic effect of tuberculin is the best gauge of the therapeutic potency of an antituberculous serum. He has tried the serum clinically in 82 cases, including all forms of pulmonary tuberculosis from the gravest to the slightest, and has arrived at the following conclusions:

1. Cases in which there are circumscribed foci of disease without any great degree of fever, and without any great admixture of other micro-organisms (diplococci, streptococci), are commonly benefited. He has used the serum in 45 such cases, and all of these (29 in number) in which the treatment was carried out systematically might be looked upon as cured. The remaining 16 improved greatly, but at the date of the report they were still under treatment, or, believing themselves to be cured, had declined to continue it.

2. Cases in which there are diffuse foci of tuberculous bronchopneumonia, but without any considerable association of other microbes, even if moderately febrile, are benefited in some degree, occasionally, to such an extent as to give grounds for hope that, by perseverance with the treatment, a complete cure may be effected. Of 14 such cases treated, all were improved, some to a marked degree.

3. Cases of diffuse bronchopneumonia, with considerable association of other micro-organisms, are not appreciably benefited by the serum treatment alone. Of 14 such cases under treatment, however, none got worse, and some even gained a little.

4. Cases of destructive bronchopneumonia with cavities derive some slight benefit from the treatment. Of 9 such cases 3 showed some improvement (reduction of temperature and increase of weight); 4 others were very slightly benefited, and in 2 the disease was not checked, but ran on to a fatal issue. The improvement, according to Professor Maragliano, is lasting, provided the treatment be continued as long as is necessary to bring about a cure. In some of his cases the cure has been maintained for two years; in others, in which the treatment has been abandoned prematurely, relapse has occurred. The mechanism of the curative action of the serum is

believed by the author to be that by means of it defensive materials are introduced into the organism where they lead to the production of others. He deprecates any exaggerated expectations in advanced stages of the disease when there exist profound lesions of tissue, and he emphatically declares that "antituberculous serotherapy can be of use, and can reasonably be expected to effect a cure, only in those cases of pulmonary tuberculosis in which no destructive foci exist."

The duration of the disease is a secondary matter. The important points are the extent, intensity and nature of the pulmonary lesions. Another point of great moment as regards the result of treatment is whether one has to do with simple tuberculous infection or with a mixed infection. The association of diplococci and streptococci with the bacilli of tuberculosis retards or altogether neutralises the effect of the treatment. Haemoptysis is not a contraindication, and indeed Professor Maragliano does not admit any contraindication whatever; he insists that the treatment is applicable in all forms of pulmonary tuberculosis. It is never injurious, and nearly always does good.

As regards the prophylactic value of the remedy, he has not yet been able to come to a definite decision, but he seems inclined to be hopeful on this point.

As regards the technique of the injections, a situation in which the subcutaneous connective tissue is loose should be chosen; the site which he prefers is in the posterior axillary line towards the base of the thorax. Of course the most scrupulous aseptic and antiseptic precautions must be observed. The injections do not cause pain, and as a rule are not followed by local reaction; in a few cases, however, there was some redness, swelling, and pain at the site of injection, occasionally with slight rise of temperature. All these phenomena disappeared in two or three days.

In cases in which there is no pyrexia Professor Maragliano begins by injecting 1 c.cm. on alternate days for ten days; then he injects 1 c.cm. every day for ten days; finally two injections of the same quantity are given daily for ten days. When there is pyrexia an attempt should be made to subdue it by high doses, and 10 c.cm. of serum should be given at once. If the temperature does not rise again, after three days a daily injection of 1 to 2 c.cm. should be given; if, however the fever persists, a second injection of 10 c.cm. should be given eight days after the first. The beneficial effects of the treatment show themselves, sometimes within a fortnight, sometimes not till after a couple of months. Even when cure seems to be complete the treatment should be continued for at least a month, and Professor Maragliano thinks it would be well by way of precaution to give a weekly injection of 1 c.cm. for at least a year. General hygienic treatment (climate, nourishing food, and particularly careful attention to the efficiency of the digestive apparatus) must on no account be neglected. Of the manner in which the antituberculous treatment just described may be combined with the treatment of accessory infections Professor Maragliano proposes to speak in a future communication.

HOSPITAL OFFICERS AND CORONERS' FEES.

A LETTER was addressed recently by the Medical Defence Union to the Chairman of the London County Council, calling attention to the serious grievance under which the resident medical officers of hospitals suffer, in that they are compelled to make *post-mortem* examinations by order of the coroner of their district, to attend the court and to give evidence without fee. In this way a large amount of time is occupied in discharging a duty which, if performed by a medical man not attached to a hospital, would be recognised by the payment of the customary fee. After ten days' consideration, the clerk of the Council replied that the Council regretted that it had no power, in face of the specific provisions of Section 21 (2) of the Coroners Act, 1887, to sanction the payment of such fees. Mr. de la Hooke added that the Council was of opinion "that if an amendment of the law in this respect is desired, the matter is one in which action should be taken by the medical officers themselves."

The section on which the County Council relies is Section

22, not 21 (2) as stated. Section 22 of the Coroners Act, 1887, 50 and 51, V. c. 71, provides that where an inquest is held on the body of a person who has died in a public hospital, etc., "the medical officer whose duty it may have been to attend the deceased person as a medical officer of such institution shall not be entitled to such fee or remuneration." *Sect. 22* refers to the fee for attending to give evidence at an inquest or for making a *post-mortem* examination when directed to do so by the coroner.

We do not know of any duty being imposed on medical officers of hospitals to hold *post-mortem* examinations for the information of coroners, at their own expense or at the expense of the hospital. Section 23 makes them liable to a penalty for failing to obey a coroner's summons to attend an inquest and give evidence; and, until the words of Section 22 are altered, the medical officer of a hospital may be bound to attend without remuneration. As regards *post-mortem* examinations, we think such medical officer may decline to undertake them unless paid. The coroner will then have to instruct some independent practitioner, who will clearly be entitled to his fee, to make the examination, or else to order the fee to be paid to the medical officer of the hospital.

SMALL-POX IN NOTTINGHAM IN 1894.

XVIII.—A REMARKABLE OUTBREAK.

It is seldom that health officers have such a unique outbreak of infectious disease to chronicle as had Dr. Boobyer in regard of small-pox in the borough of Nottingham last year. The prevalence in question comprised 27 cases, and was brought to light as the result of the notification of a suspicious case of the disease in a small yard in the centre of the old town. Proceeding to the spot, Dr. Boobyer found 8 cases in the yard, 2 of them of three and five weeks' duration respectively, the first being evidently infected from the county asylum by an outsider, and the second the husband of the first patient. These two persons, as the event showed, worked at their homes all through their illnesses on cotton material supplied through a contractor from a local warehouse, and consigned the material back to the warehouse on January 3rd and 6th while they were still suffering. Proceeding to the warehouse, Dr. Boobyer found as the result of exact study of the facts that of 27 workers in one room in which the returned material in question had been dealt with, no fewer than 16 individuals were absent with small-pox, and that 3 others were still at work though ill of the malady. In these cases generally the disease was of mild type, and the period of incubation short; while it would seem likely that some of the sufferers had inoculated themselves with the virus of small-pox in the course of their work. It appears that material from the home of the original cases was sent later to one other warehouse but inquiries as to any disease to be regarded as traceable to the material was negative only; and Dr. Boobyer is of opinion that the cotton may at the time of this later transmission have been free from infective quality, and that small-pox does not retain its quality of infectiveness so long as is often supposed. The seriousness of the retention of goods capable of carrying infection in a home where there is disease of the nature of small-pox is strongly emphasized, and on its becoming known that there was still material in the house of the first cases ready to be sent under consignment through the contractor to the warehouse again, measures of a penal character were adopted, and this, too, successfully, against the person so consigning the goods. Needless to say that all necessary steps for repression of the outbreak were promptly taken by the health officer.

THE GRACE TESTIMONIAL.

The following subscriptions have been received on behalf of this fund:

	Grants.		Buildings.

ASSOCIATION INTELLIGENCE.

NOTICE OF LAST QUARTERLY MEETING FOR 1895.

ELECTION OF MEMBERS.

A MEETING of the Council will be held on October 23rd, 1895. Candidates for election by the Council of the Association must send in their forms of application to the General Secretary not later than twenty-one days before the meeting—namely, October 2nd, 1895.

Any qualified medical practitioner, not disqualified by any by-law of the Association, who shall be recommended as eligible by any three members, may be elected a member by the Council or by any recognised Branch Council.

Candidates seeking election by a Branch Council should apply to the Secretary of the Branch. No members can be elected by a Branch Council unless their names have been inserted in the circular summoning the meeting at which they seek election.

FRANCIS FOWKE, General Secretary.

LIBRARY OF THE BRITISH MEDICAL ASSOCIATION.

MEMBERS are reminded that the Library and Writing Rooms of the Association are fitted up for the accommodation of the members in commodious apartments, at the offices of the Association, 429, Strand. The rooms are open from 10 A.M. to 5 P.M. Members can have their letters addressed to them at the Office.

BRANCH MEETINGS TO BE HELD.

BORDER COUNTIES BRANCH.—The annual meeting, which was unavoidably postponed, will be held at Dumfries in the third week of August.—J. ALTHAM, Honorary Secretary, Penrith.

MIDLAND BRANCH: DERBYSHIRE DIVISION.—There will be a meeting at the Whitworth Institute, Darley Dale, on Thursday, September 5th. The President, Dr. Moxon, kindly invites the members to afternoon tea, and Lady Whitworth will throw open her gardens and grounds. Afterwards it is proposed to drive to Matlock Bath to dine at the New Bath Hotel. Members are requested to give notice of communications to be brought before the meeting before August 20th to J. A. SOOTHAM, Honorary Secretary, Friar Gate, Derby.

SOUTHERN BRANCH: ISLE OF WIGHT DISTRICT. The fifty-sixth meeting of this District was held at Sandown on July 19th; Mr. C. MEZRES (Sandown), Vice-President, in the chair.

Confirmation of Minutes.—The minutes of the previous meeting were read and confirmed.

New Members.—Messrs. H. W. Ewen, of East Cowes, and L. L. Preston, of Ryde, were elected members.

Future Meetings.—A resolution, "that time and place of future meetings should be fixed at the meeting immediately preceding," was carried *nem. con.*

The Association and the Protection of Medical Interests.—A letter having been read as to the Council of the British Medical Association taking authority to protect the interests of the medical profession, the meeting was informed by Dr. ROBERTSON that this matter had been already dealt with by the district.

Report of the Royal Commission on Tuberculosis.—Dr. ROBERTSON (Ventnor) initiated a discussion on this subject. He briefly reviewed the question of the relation of animal tuberculosis to human health from 1881, when Dr. Creighton, of Cambridge, at the International Medical Congress, stated his "grounds for believing that the tuberculous disease (Perlsucht) of animals which supply milk and meat for human use is communicated by such food to man." The findings of the Commission might be summed up as follows:—1. Meat: While believing that with proper care and skilled supervision a great deal of meat from tuberculous cattle might be consumed without danger to the community, the Commission were "well aware that the difficulties of such supervision are so great that many years must elapse before any measure of an effectual kind can be carried into practice." 2. Milk: Tuberculous milk is so virulent that out of twenty-eight animals experimented on with it not one failed to develop tuberculosis. "Tuberculous disease of the cow affecting the udder" is necessary to give this virulent quality to milk. But the presence in a dairy of a tuberculous

cow is a decided source of danger to the public, especially having regard to the rapid development of tuberculosis in the udder. "The boiling of milk even for a moment would probably be sufficient to remove the very dangerous quality of tuberculous milk." In effect the Royal Commission had been unable to solve the economic difficulty, and the drastic recommendations of the Departmental Committee of 1888 were amply justified by these more detailed investigations of 1890-95. —The discussion was continued by the CHAIRMAN, Dr. GROVES, Dr. SHIRTLEIFF, and by Dr. HARLAND, who suggested that as warmth less than boiling point was stated in the report to exercise a destructive power upon the tubercle bacillus, the same means might perhaps be used to attenuate the virus of rabies, or other virus, as a quicker method than that of Pasteur.—Dr. ROBERTSON concluded the discussion by moving a resolution:

That the attention of the Rural and Urban District Councils should be called to the report of the Royal Commission to inquire into the effect of meat derived from tuberculous animals on human health; and that it be recommended that means be taken to insure the proper inspection of milk and meat supplies, so as to prevent the grave dangers pointed out by the said report.

This was seconded by Mr. GREEN, and carried unanimously. —A vote of thanks was then passed to Dr. Robertson for his able handling of the matter.

Next Meeting.—It was proposed by Dr. ROBERTSON, and seconded by Dr. GODFREY:

That the next meeting be held at Sandown in the third week of October.

Vote of Thanks.—The business concluded by a vote of thanks to the Chairman.

PROCEEDINGS OF THE COUNCIL.

At a meeting of the Council, held in the Council Room, Exeter Hall, Strand, London, W.O., on July 30th, 1895:

Present:

Dr. J. WARD COUSINS, President of Council, in the chair.

Mr. HENRY T. BUTLIN, Treasurer.

Dr. JAMES BARR, Liverpool. Mr. T. R. JESSOP, Leeds.
Dr. G. B. BARRON, Southport. Mr. EVAN JONES, Aberdare.
Dr. MICHAEL BEVERLEY, Norwich. Mr. JORDAN LLOYD, Birmingham.
Dr. THOMAS BRIDGWATER, Harrow-on-the-Hill. Dr. J. W. MILLER, Dundee.
Dr. J. SPOTTISWOODE CAMERON, Leeds. Mr. W. JONES MORRIS, Portmadoc.
Dr. JOHN CAMPBELL, Belfast. Mr. R. H. B. NICHOLSON, Hull.
Mr. ANDREW CLARK, London. Mr. C. H. WATTS PARKINSON, Wimborne Minster.
Dr. H. RADCLIFFE CROCKER, London. Dr. CHARLES PARSONS, Dover.
Dr. GEORGE W. CROWE, Worcester. Dr. G. HARE PHILIPSON, Newcastle-on-Tyne.
Dr. ALEXANDER DEMPSEY, Belfast. Dr. WILLIAM RUSSELL, Edinburgh.
Mr. E. DONALDSON, Londonderry. Dr. ROBERT SAUNDSEY, Birmingham.
Dr. J. LANGDON H. DOWN, London. Dr. ALFRED SHEEN, Cardiff.
Brig.-Sur.-Lt.-Col. E. F. DRAKE-BROCKMAN, London. Dr. E. MARKHAM SKERRITT, Clifton.
Mr. GEORGE EASTES, M.B., London. Mr. NOBLE SMITH, London.
Dr. W. A. ELLISTON, Ipswich. Mr. HENRY STEAR, Safron Walden.
Dr. D. W. FINLAY, Aberdeen. Dr. J. ROBERTS THOMSON, Bournemouth.
Sir B. WALTER FOSTER, M.D., M.P., Birmingham. Dr. WILLIAM THOMSON, Dublin.
Dr. J. H. GALTON, Upper Norwood. Dr. THEOPHILUS W. TREND, Southampton.
Dr. BRUCE GOFF, Bothwell. Dr. A. R. URQUHART, Perth.
Dr. H. HANDFORD, Notting-ham. Mr. F. WALLACE, London.
Mr. J. HUGHES HEMMING, Kimbolton. Mr. C. G. WHEELHOUSE, Fife.
Dr. O. HOLMAN, London. Mr. JOSEPH WHITE, London.
Mr. ARTHUR JACKSON, Sheffield. Dr. A. D. WILLIAMS, Hampton Hill.
Mr. ALFRED WINEFIELD, Oxford.

The minutes of the last meeting having been printed and

circulated were taken as read. Minute 3,214 was amended by striking out the words "at the next annual meeting" in the last line, and inserting the words "to a future meeting of the Council." The minutes were then signed as correct.

Read letters of apology for non-attendance from Dr. Wade and Mr. Langley Brown.

A letter from Mr. Gomme, Statistical Officer of the London County Council, was read, asking the opinion of the Council as to the form the quinquennial census should take.

Resolved: That the matter be deferred till the Council meeting in October.

Read letter of the solicitor in reply to questions by the President of Council:

14, Austin Friars, London, E.C., July 16th, 1895.

My dear Sir.—In reply to the questions contained in your letter of yesterday, I think it must first be assumed that it is impossible now to go back to any state of things which existed before the Association became incorporated; at any rate for the purpose of putting a construction on its objects as defined by a legal document. In this view no change has taken place in the Medical Acts since the Association defined the objects for which it existed, and I am of opinion, therefore, that the object of carrying out the Medical Acts as serving to maintain the honour and interests of the medical profession cannot be read into the definition contained in the Memorandum of Association, as to how that honour and these interests are to be maintained. Nor do I think that to alter the Memorandum of Association by the addition of the words proposed would be sufficient or satisfactory; and that if the Memorandum is to be altered, the terms should be far more explicit for giving effect to the intention.

At the risk of repeating what I have said before, the legal power of the Society of Apothecaries to sue for a penalty of £20 as conferred by Act of Parliament can only be taken away by another Act of Parliament.

Failing this being accomplished, the British Medical Association can only apply to the Society of Apothecaries for permission to use their name like the Defence Union do at present.—Yours faithfully,

F. FOWKE, Esq.

JAMES R. UPTON.

Read letter from the Right Hon. the Earl of Stamford, President of the Civil Rights Defence Association, enclosing report of the Committee.

Resolved: That the consideration of his communication be deferred till the October meeting and that a copy of the report be sent to each member of Council.

The one hundred and fifteen candidates whose names appeared in the circular convening the meeting were then considered.

Resolved: That the one hundred and fifteen candidates whose names appeared on the circular convening the meeting be and they are hereby elected members of the British Medical Association.

Read the following resolution carried at the annual meeting of the South-Western Branch, held at Tiverton June 26th, 1895:

That it is to the interest of the public and of the medical profession that the Council of the British Medical Association should take power and authority to protect both the individual and collective interests of the medical profession, and that the Council be requested to take such steps as may be necessary to enable it to actively undertake such duties.

Read communication from Mr. W. G. Dickinson asking that a notice of the Association of Members of the Royal College of Surgeons should be placed in the reception room at King's College during the meeting of the Association.

Resolved: That Mr. Dickinson be informed the Council is unable to accede to his request.

LIST OF ATTENDANCES OF COUNCIL—SEVEN MEETINGS.

	Total Attendances.
Dr. E. Long Fox, Clifton, President...	5
Sir J. Russell Reynolds, Bart., F.R.S., London, President-elect...	3
Dr. J. Ward Cousins, Portsmouth, President of Council...	7
Mr. H. T. Butlin, D.C.L., F.R.C.S., London, Vice-President, Treasurer...	7
Sir H. W. Acland, K.C.B., M.D., F.R.S., Oxford, Vice-President...	0
Sir J. T. Banks, Dublin, Vice-President...	0
Dr. James Barr, Liverpool, R...	6
Dr. G. B. Barron, Southport, R...	4
Mr. B. Barrow, F.R.C.S., Uffculme, Vice President...	0
Dr. R. W. Batten, Gloucester, R...	3
Dr. M. Beverley, Norwich, R...	7
Dr. T. Bridgwater, LL.D., Harrow-on-the-Hill, Vice-President...	5
Dr. J. S. Bristowe, F.R.S., London, R...	0
Mr. Langley Browne, F.R.C.S., West Bromwich, R...	5
Dr. J. S. Cameron, Leeds, R...	7
Dr. John Campbell, Belfast, R...	2
Mr. Andrew Clark, F.R.C.S., London, R...	7
Dr. H. Radcliffe Crocker, London, R...	7
Dr. G. W. Crowe, Worcester, R...	6
Dr. J. Cuming, Belfast, Vice-President...	0

	Total Attendances.
Dr. A. Dempsey, Belfast, R.	3
Dr. E. H. Ingham, Liverpool, R.	3
Mr. E. Donaldson, Londonderry, R.	1
Dr. J. Langdon H. Down, London, R.	8
Brigade-Surgeon Lieutenant-Colonel E. F. Drake-Brockman, F.R.C.S., London, R.	2
Dr. D. Drummond, D.C.L., Newcastle-on-Tyne, R.	0
Mr. George Eastes, London, R.	6
Dr. W. T. Edwards, Cardiff, Vice-President	0
Dr. W. A. Elliston, Ipswich, R.	7
Dr. David W. Finlay, Aberdeen, R.	4
Sir H. W. Foster, M.D., D.C.L., M.P., Birmingham, Vice-President	3
Mr. H. S. Fowler, Bath, R.	2
Professor W. T. Gairdner, M.D., F.R.S., Glasgow, Vice-President	0
Dr. J. H. Galton, Upper Norwood, R.	6
Dr. C. E. Glascock, Manchester, R.	0
Dr. Bruce Goff, Bothwell, R.	7

Dr. A. R. Urquhart, Perth, R.	4
Mr. T. J. Verrall, Brighton, R.	5
Dr. W. F. Wade, Birmingham, Vice-President	6
Mr. F. Wallace, London, R.	7
Dr. A. T. H. Waters, Liverpool, Vice-President	0
Mr. C. G. Wheelhouse, F.R.C.S., Fife, Vice-President	3
Mr. Joseph White, D.C.L., F.R.C.S., London, Vice-President	6
Mr. A. D. Williams, M.D., Hampton Hill, R.	3
Mr. G. E. Williamson, F.R.C.S., Newcastle-on-Tyne, R.	1
Mr. Alfred Winkfield, F.R.C.S., Oxford, R.	5
Dr. W. L. Winterbotham, Bridgwater, R.	2

* The letter R signifies Representative of a Branch.

At a meeting of the Council held in the Council Room, Exeter Hall, Strand, London, W.O., on Wednesday, July 31st, 1895:

Present:

Dr. J. Ward Cousins, President of Council, in the chair.
Mr. HENRY T. BUTLIN, Treasurer.

Dr. JAMES BARR, Liverpool. Dr. G. W. CROWE, Worcester.
Dr. G. E. BARRON, Southport. Dr. J. CUMING, Belfast.
Dr. MICHAEL BEVERLEY, Norwich. Dr. ALEXANDER DEMPSEY, Belfast.
Dr. THOMAS BRIDGWATER, Harrow-on-the-Hill. Mr. E. DONALDSON, Londonderry.
Dr. J. SPOTTISWOOD CAMERON, Leeds. Dr. J. LANGDON H. DOWN, London.
Dr. JOHN CAMPBELL, Belfast. Brig.-Surgeon-Lt. Col. E. F. DRAKE-BROCKMAN, London.
Mr. ANDREW CLARK, London. Dr. GEORGE EASTES, M.B., London.
Dr. H. RADCLIFFE CROCKER, London.

Dr. W. A. ELLISTON, Ipswich. Dr. G. HARR PHILIPSON, Newcastle-on-Tyne.
Dr. D. W. FINLAY, Aberdeen. Dr. F. M. POPE, Leicester.
Dr. BRUCE GOFF, Bothwell. Dr. WILLIAM RUSSELL, Edinburgh.
Dr. OGILVIE GRANT, Inverness. Dr. A. W. SANDFORD, Cork.
Dr. H. HANDFORD, Nottingham. Dr. A. SHEEN, Cardiff.
Mr. J. HUGHES HEMMING, Kimbolton. Dr. E. MARKHAM SKERRITT, Clifton.
Dr. C. HOLMAN, London. Mr. NOBLE SMITH, London.
Mr. ARTHUR JACKSON, Sheffield. Mr. HENRY STEAR, Saffron Walden.
Mr. T. VINCENT JACKSON, Wolverhampton. Dr. J. ROBERTS THOMSON, Bournemouth.
Mr. T. R. JESSOP, Leeds. Dr. T. W. TREND, Southampton.
Mr. EVAN JONES, Aberdare. Dr. A. R. URQUHART, Perth.
Mr. JORDAN LLOYD, Birmingham. Mr. T. J. VERRALL, Brighton.
Dr. L. MACKENZIE, Tiverton. Mr. F. WALLACE, London.
Mr. C. N. MACNAMARA, London. Mr. C. G. WHEELHOUSE, Fife.
Mr. H. J. MANNING, Salisbury. Mr. JOSEPH WHITE, London.
Mr. W. JONES MORRIS, Portmadoc. Dr. A. D. WILLIAMS, Hampton Hill.
Mr. R. H. B. NICHOLSON, Hull. Mr. G. E. WILLIAMSON, Newcastle-on-Tyne.
Dr. J. W. OSWALD, London. Mr. A. WINKFIELD, Oxford.
Mr. C. H. WATTS PARKINSON, Wimborne Minster. Dr. S. WOODCOCK, Manchester.
Dr. CHARLES PARSONS, Dover.

The minutes of the last meeting having been printed and circulated and no objection taken were signed as correct.

The President reported the returns of the election of representatives of Branches on the Council:

Aberdeen, Banff, and Kincardine Branch.—D. W. Finlay, Aberdeen. Adelaide and South Australia Branch.—(No return.) Barbados Branch.—Surgeon-Major W. B. Thomson, York. Bath and Bristol Branch.—R. S. Fowler, Bath. E. Markham Skerritt, Bristol. Bermuda Branch.—(No return.) Birmingham and Midland Counties Branch.—Langley Browne, West Bromwich; Jordan Lloyd, Birmingham; Robert Sandby, Birmingham. Bombay Branch.—Sir Wm. Moore, K.C.I.E., London. Border Counties Branch.—R. Somerville, Galashiels. British Columbia Branch.—E. Haswell, British Columbia. British Guiana Branch.—A. D. Williams, Hampton Hill. Burma Branch.—(No return.) Cambridge and Huntingdon Branch.—Henry Stear, Saffron Walden, Essex. Cape of Good Hope Branch.—(No return.) Colombo, Ceylon Branch.—(No return.) Cork and South of Ireland Branch.—A. Sandford, Cork. Dorset and West Hants Branch.—C. H. W. Parkinson, Wimborne Minster. Dublin Branch.—Wm. Thomson, Dublin. Dundee and District Branch.—J. W. Miller, Dundee. East Anglian Branch.—M. Beverley, Norwich; W. A. Elliston, Ipswich. East York and North Lincoln Branch.—R. H. B. Nicholson, Hull. Fife and Perth Branch.—Wm. Russell, Edinburgh. Gibraltar Branch.—Wm. Turner, Gibraltar. Gloucestershire and West of England Branch.—Bruce Goff, Bothwell. Lancashire, Cheshire, and Derbyshire Branch.—R. W. Hatten, Gloucester. Gloucestershire and Eastern Province Branch.—E. Atherstone, Grimsdale West Branch.—(No return.) Halifax (Nova Scotia) Branch.—D. A. Campbell. Hong Kong and China Branch.—(No return.) Jamaica Branch.—J. W. Plaxton, Liverpool and Cheshire Branch.—James Barr, Liverpool; G. B. Barron, Southport; E. H. Dickinson, Liverpool; James Taylor, Chester. S. W. Woodcock, Manchester. Leeward Islands Branch.—(No return.) London, Surrey, and North-West of Ireland Branch.—E. Donaldson, Londonderry. Malta and Mediterranean Branch.—(No return.) Malaya Branch.—W. G. Elliot, Malacca. West of Canada Branch.—(No return.) Melbourne and Victoria Branch.—(No return.) Metropolitan Counties Branch.—Andrew Clark H. Radcliffe Crocker, Geo. Eastes, J. W. Oswald, Hy. Power, Noble Smith, Frank Wallace, London. Midland Branch.—H. Handford, Nottingham. F. M. Pope, Leicester. Montreal Branch.—(No return.) North of Ireland Branch.—David Drummond, Newcastle-on-Tyne. G. E. Williamson, Newcastle-on-Tyne. North Wales Branch.—John Campbell, Belfast. A. Dempsey, Belfast. North Wales Branch.—W. Jones Morris, Portmadoc. Northern Counties of Scotland Branch.—Ogilvie Grant, Inverness. Oxford and District Branch.—Alfred Winkfield, Oxford. Perthshire Branch.—A. R. Urquhart, Perth. Punjab Branch.—(No return.) Reading and Upper Thames Branch.—J. B. Isaac, Crowthorne, Dorchester and Dorset Branch.—John Davies Harries, Shrewsbury. South Wales Branch.—J. H. Galton, Crowthorne, S.E. C. Parsons, Dover. T. J. Verrall, Brighton. South Western of Ireland Branch.—J. C. L. Stawell, T. J. Verrall, Brighton. South Western of Ireland Branch.—Brigade-Surgeon-Lieutenant-Colonel E. F. Drake-Brockman, London. South Western Branch.—J. H. Hemming, Kimbolton. South Western and Devon Branch.—Evan Jones, Aberdare; A. Sheen, Cardiff. South Western Branch.—Wm. Gordon, Exeter; L. Mackenzie, Tiverton. Somerset Branch.—H. J. Manning, Salisbury. Southampton and Fareham Branch.—T. Vincent Jackson, Wolverhampton. Somerset, Devon, and Cornwall Branch.—John Strachan, Dollar. N.R. Reading and New South Wales Branch.—(No return.) Portland and Folkestone Branch.—(No return.) Thames Valley Branch.—J. Langdon H. Down, London. West Somerset Branch.—W. L. Winterbotham, Bridgwater. West Somerset and Exeter Branch.—G. W. Crowe, Worcester. Yorkshire Branch.—J. S. Cameron, Leeds; Arthur Jackson, Sheffield; T. R. Jessop, Leeds.

Dr. J. W. Oswald, of the Metropolitan Counties Branch, Dr. S. Woodcock, of the Lancashire and Cheshire Branch, and Dr.

Mackenzie, of the South-Western Branch, attending the Council for the first time, were introduced to the Council by Mr. Eastes.

Read letter from Professor Michael Foster and Dr. Lauder Brunton asking the Council to grant a room for a meeting to be held on Thursday afternoon in connection with the Huxley Memorial, that notice should be posted saying that the meeting was to be held, should also be published in the Daily Journal and should be announced by the Presidents of Sections.

Resolved: That a room be allowed for a meeting connected with the Huxley Memorial on Thursday afternoon, after the address in Surgery, and that a notice be posted in the reception hall and also be placed in the Daily Journal.

Resolved: That it be recommended to the annual meeting that the Council have power to arrange a place for the annual meeting for 1896 and further to appoint a President-elect.

Resolved: That in the opinion of this Council the granting of testimonials which are used for the purpose of advertising proprietary drugs and similar articles is inconsistent with the dignity of the profession and opposed to its best interests.

Resolved: That the resolution just passed be referred to the Ethical Section.

Dr. Crowe presented to the Association a bronze medal of the late Sir Charles Hastings, the founder of the Association, which had been presented to him by the artists. Knowing that any such relic would be valued he had much pleasure in presenting it to the Association.

At a meeting of the Council held in the Council Room, Exeter Hall, Strand, London, W.C., on Thursday, August 1st, 1895:—

Present:

Dr. J. WARD COUSINS, President of Council, in the chair.
Mr. HENRY T. BUTLIN, Treasurer.
Dr. JAMES BARR, Liverpool.
Dr. G. B. BARRON, Southport.
Dr. MICHAEL BEVERLEY, Norwich.
Dr. THOMAS BRIDGWATER, Harrow-on-the-Hill.
Dr. J. SPOTTISWOODE CAMERON, Leeds.
Dr. JOHN CAMPBELL, Belfast.
Mr. ANDREW CLARK, London.
Dr. H. RADCLIFFE CROCKER, London.
Dr. G. W. CROWE, Worcester.
Dr. ALEXANDER DEMPSEY, Belfast.
Brigade-Surgeon-Lieutenant-Colonel E. F. DRAKE-BROCKMAN, London.
Mr. GEORGE EASTES, M.B., London.
Dr. W. A. ELLISTON, Ipswich.
Dr. DAVID W. FINLAY, Aberdeen.
Dr. J. H. GALTON, London.
Dr. BRUCE GOFF, Bothwell.
Dr. OGILVIE GRANT, Inverness.
Dr. H. HANDFORD, Nottingham.
Mr. J. HUGHES HEMMING, Kimbolton.
Dr. C. HOLMAN, London.
Mr. A. JACKSON, Sheffield.
Mr. T. VINCENT JACOBSON, Wolverhampton.
Mr. T. R. JESSOP, Leeds.
Mr. EVAN JONES, Aberdare.
Mr. JORDAN LLOYD, Birmingham.
D. L. MACKENZIE, Tiverton.
Mr. C. N. MACNAMARA, London.
Mr. H. J. MANNING, Salisbury.
Dr. J. W. MILLER, Dundee.
Mr. W. JONES MORRIS, Portsmouth.
Mr. R. H. B. NICHOLSON, Hull.
Dr. J. W. J. OSWALD, London.
Mr. C. H. WATTS PARKINSON, Wimborne Minster.
Dr. C. PARSONS, Dover.
Dr. G. H. PHILLIPS, Newcastle-on-Tyne.
Dr. F. M. POPE, Leicester.
Dr. WILLIAM RUSSELL, Edinburgh.
Dr. A. W. SANDFORD, Cork.
Dr. ROBERT SAUNDY, Birmingham.
Dr. ALFRED SHERR, Cardiff.
Dr. E. MARKHAM SKERRITT, Clifton.
Mr. NOBLE SMITH, London.
Mr. HENRY STEAR, Saffron Walden.
Dr. J. ROBERTS THOMSON, Bournemouth.
Dr. T. W. TREND, Southampton.
Dr. A. R. URQUHART, Perth.
Mr. T. JENNER VERRALL, Brighton.
Mr. F. WALLACE, London.
Mr. C. G. WHEELHOUSE, Fife.
Mr. JOSEPH WHITE, London.
Dr. A. D. WILLIAMS, Hampton Hill.
Mr. G. E. WILLIAMSON, Newcastle-on-Tyne.
Mr. ALFRED WINKFIELD, Oxford.

The minutes of the last meeting were read and found correct.

There appeared to be six vacancies on the Journal and Finance Committee, and thirteen members of the Council were nominated to fill the vacancies.

A ballot was taken, and Dr. Galton and Mr. Andrew Clark having been appointed scrutineers the following appeared to have the greatest number of votes:

Dr. Markham Skerritt; Dr. Holman; Dr. Bridgwater; Sir Walter Foster; Mr. Vincent Jackson; and Mr. Jones Morris.

Resolved: That the following be appointed the Journal and Finance Committee for the ensuing twelve months:

The President; the President-elect; the President of Council; the Treasurer; Dr. J. Barr; Dr. Bridgwater; Dr. Spottiswoode Cameron; Dr. H. R. Crocker; Dr. W. A. Elliston; Sir Walter Foster; Dr. Bruce Goff; Dr. Ogilvie Grant; Dr. Holman; Mr. Vincent Jackson; Mr. T. R. Jessop; Mr. Jones Morris; Mr. Nicholson; Dr. R. Saundby; and Dr. Markham Skerritt.

Resolved: That the following members be appointed the Parliamentary Bills Committee for the ensuing twelve months:

The President; the President-elect; Dr. J. Ward Cousins, the President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Mr. S. H. Agar; Dr. E. Atherstone; Mr. D. B. Baiding; Dr. A. G. Bateman; Dr. H. W. Batten; Dr. T. Bridgwater; Mr. George Brown; Dr. J. S. Cameron; Dr. R. R. Carey; Dr. W. A. Carlisle; Dr. W. F. Cleveland; Dr. G. W. Crowe; Dr. E. Donaldson; Dr. J. Langdon Down; Mr. George Eastes; Dr. R. Esler; Mr. E. H. Galton; Dr. Bruce Goff; Dr. W. Gordon; Dr. Ogilvie Grant; Mr. J. D. Harries; Dr. A. J. Harrison; Mr. Ernest Hart; Mr. E. Hassell; Mr. J. H. Hemming; Dr. Holman; Professor V. Horsley; Dr. W. H. Hughes; Mr. Arthur Jackson; Mr. Evan Jones; Mr. T. C. Langton; Dr. A. R. Manby; Surgeon-Major T. A. P. Marsh; Dr. W. J. Mickle; Dr. C. H. Milburn; Dr. J. W. Miller; Mr. W. Jones Morris; Dr. James Murphy; Professor A. Ogston; Dr. I. Owen; Mr. C. H. W. Parkinson; Dr. H. R. Phillips; Dr. G. Reid; Dr. James Ritchie; Dr. G. E. Spottiswoode; Dr. R. Somerville; Mr. W. D. Spanton; Dr. J. Strachan; Mr. C. T. Street; Dr. James Stuart; Mr. James Taylor; Dr. G. D. P. Thomas; Dr. W. Thomson; Professor E. R. Townsend; Dr. A. R. Urquhart; Mr. T. J. Verrall; Mr. F. Wallace; Mr. A. Winkfield; Dr. W. L. Winterbottom; and Dr. S. Woodcock.

Resolved: That the following members be appointed the Scientific Grants Committee, and that a grant of £250 be made for the purposes of the Committee for the ensuing twelve months:

The President; the President-elect; Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Dr. Wm. Anderson; Dr. T. L. Brunton; Dr. H. R. Crocker; Dr. H. Handford; Dr. J. Holman; Professor V. Horsley; Sir Joseph Lister, Bart.; Mr. N. G. Macnamara; Dr. C. Parsons; Dr. W. Russell; Dr. R. Saundby; Professor E. A. Schiler; and Dr. G. Sims Woodhead.

Resolved: That the following members be reappointed the Inebriates Legislation Committee:

The President; the President-elect; Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Mr. D. B. Baiding; Mr. R. W. Branthwaite; Dr. T. Bridgwater; Sir C. Cameron, M.P.; Dr. G. H. Clark, M.P.; Dr. G. B. Drysdale; Mr. George Eastes; Dr. J. W. Eastwood; Dr. R. Farquharson, M.P.; Sir Walter Foster, M.P.; Professor W. T. Gairdner; Dr. W. G. Garman; Dr. J. Hill Gibson; Dr. Alexander Grant; Mr. F. J. Gray; Dr. C. J. Hare; Dr. A. A. Jamison; Mr. H. R. Kerr; Dr. Norman Kerr; Dr. A. E. T. Longhurst; Surgeon-Major G. K. Foote; Brigade-Surgeon R. Pringle; Fleet Surgeon G. Robertson; Dr. J. Stewart; Dr. G. D. F. Thomas; Dr. Wynn Westcott; and Dr. H. W. Williams.

Resolved: That the following members be reappointed the Premises and Library Committee:

The President; the President-elect; Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Dr. T. Bridgwater; Dr. J. S. Cameron; Dr. C. Holman; Mr. N. G. Macnamara; Dr. F. Wade; Mr. C. G. Wheelhouse; and Mr. Ernest Hart, Honorary Librarian.

Resolved: That the following members be reappointed the Trusts Funds Committee:

The President; the President-elect; Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Dr. T. Bridgwater; Mr. N. G. Macnamara; Dr. R. Saundby; and Mr. C. G. Wheelhouse.

Resolved: That the following members be reappointed the Therapeutic Committee, and that a grant of £50 be made for the purposes of the Committee for the ensuing twelve months:

Sir W. H. Broadbent; Dr. Mitchell Bruce; Dr. T. Lauder Brunton; Professor T. Cash; Dr. M. Charteris; Professor T. H. Fraser; Professor W. T. Gairdner; Dr. W. Hunter; Dr. D. J. Leech; Dr. James Little; Professor D. MacAlister; Dr. E. Mackey; Dr. Sidney H. C. Martin; Dr. M. McHugh; Dr. W. Murrell; Dr. C. Y. Pearson; Dr. C. D. F. Phillips; Dr. Sydney Ringer; Sir William Roberts; Dr. R. Saundby; Dr. R. Stockman; Dr. N. I. C. Tirard; Dr. W. Hale White; and Dr. W. Whiffa.

Resolved: That the Committee for Investigating the Mental and Physical Condition of School Children be reappointed as follows, and that a grant of £150 be made to them for the purpose of completing the publication of their report:

Dr. H. Ashby; Dr. Fletcher Bosc; Dr. T. Bridgewater; Dr. J. L. H. Dawn; Dr. C. Holman; Dr. W. W. Ireland; Dr. F. Needham; Dr. G. H. Savage; Dr. G. E. Shuttlesworth; Dr. F. Warner; and Dr. D. Yellowless.

Resolved: That the following members be reappointed the Medical Charities Committee:

The President; the President-elect; Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Dr. E. H. Alderson; Mr. J. Wickham Barnes; Mr. W. G. Bott; Dr. T. Bridgewater; Dr. J. H. Brierley; Dr. J. S. Bristow; Mr. George Brown; Dr. G. W. Crowe; Dr. J. L. H. Dawn; Dr. Ogilvie Grant; Dr. Major Greenwood; Dr. F. de H. Hall; Mr. Ernest Hart; Mr. J. Brindley James; Dr. J. W. J. Oswald; Dr. J. R. Thomson; Mr. F. Wallace; and Dr. Hugh Woods.

Resolved: That the Reference Committee consist of the President of Council and the Treasurer, Dr. Bridgewater acting for the latter.

Resolved: That the Committee on the Use of Anæsthetics be appointed as follows, and that a grant of £50 be made for the expenses of the Committee for the ensuing twelve months:

Professor T. Annandale; Dr. Joseph Bell; Mr. Woodhouse Braine; Professor G. Buchanan; Mr. H. T. Butlin; Dr. Dudley W. Buxton; Dr. J. W. Byers; Professor M. Cameron; Professor John Chiene; Dr. C. Childs; Mr. Josiah Croft; Professor E. Duncan; Mr. George Easton; Dr. A. L. Gibson; Dr. Frederick W. Howitt; Mr. Jonathan Hutchinson; Sir Joseph Lister; Professor William Macewen; Mr. J. Mills; Professor A. Ogston; Mr. G. Rowell; Dr. W. V. Snow; Mr. T. Fridgin Teale, and Mr. David Wallace.

Resolved: That the following members be reappointed the Committee on the Control of Railway Servants' and Mariners' Hygiene:

Mr. W. M. Beaumont; Mr. T. H. Bickerton; Mr. G. A. Critchett; Dr. C. E. Fitzgerald; Dr. J. B. Lawford; Dr. D. Little; Mr. N. G. Macnamara; Dr. George Mackay; and Mr. Frestley Smith.

Resolved: That the following members be appointed the Branch Organisation Committee:

The President; the President-elect; Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Dr. Bruce Goff; Mr. Jordan Island; Dr. C. Parsons; Dr. H. Saundby; Dr. Roberts Thomson; and Dr. T. W. Trend.

Resolved: That the General Practitioners Committee be reappointed as follows:

Dr. J. Ward Cousins, President of Council; Mr. H. T. Butlin, Treasurer, *ex-officio*; Dr. T. Bridgewater; Dr. J. H. Walton; Dr. Bruce Goff; Mr. J. H. Robinson; Mr. W. James Morris; Mr. E. H. B. Nicholson; Mr. C. H. W. Parkinson; Dr. C. Parsons; Dr. F. M. Pope; Dr. H. Saundby; and Mr. F. Wallace.

SPECIAL CORRESPONDENCE.

PARIS.

Congress for the Protection of Infant Life.—Gynecological Congress.—Dangerous Trades.—Employment of Children in Factories.—General News.

At the Congress for the Protection of Infant Life recently held at Bordeaux, it was urged that in thickly-populated towns milkshops should be established, and strictly supervised, in order that sterilised milk be prepared for the use of the infant population on strictly scientific principles; and that pure milk establishments, organised for the benefit of the poor, should be placed under the jurisdiction of the municipalities. It was further decided by the Congress that no pedagogic methods in connection with school sanitation should be adopted until they had received the sanction of the Superior Council of Public Health. It was further proposed that the different States should draw up treaties obliging each State to put in force among its subjects residing in another country the law concerning the protection of infants abandoned by their parents or guardians. According to these treaties any infraction of the law is to be punished according to the decision of a law court.

The Gynecological Congress at Bordeaux was opened with an address by Professor Tarnier, who summarised the work accomplished in the Bordeaux hospitals, and described in terms of warm commendation the progress achieved. Dr. Solonief, *Professor of gynecology in the Moscow University*, read an important paper on modern female dress and its unhealthy influence. He ended by praising the Russian National Dress Society, founded with the aim of introducing and perfecting a type of costume capable of being adapted to both the taste and requirements of each individual.

Professor Gantier has sent in his report on dangerous trades to the Police Prefecture. During the years 1884 and 1885 the administration strictly enforced the measures formulated by the Conseil d'Hygiène et de Salubrité on November 25th, 1891, concerning the sanitation of factories and work-rooms where lead is used. From 1876 to 1890, when these instructions were not put into force, there were 552 lead workers annually treated in the hospitals, the entire number of lead workers amounting from 28,000 to 30,000. The days of treatment amounted to 11 140; five deaths resulted. From 1884 to 1886 there was a very evident decrease; subsequently saturnism increased, owing to the precautions being imperfectly observed, which would not occur if the work inspectors exercised a more rigorous supervision. Painters and those who work up the colours suffer most; from 1890 to 1893 760 were invalidated. This class of worker is the most numerous. Next come the coppersmiths and tanners; during the same period 53 were invalidated. Next in order come varnishers and those exposed to the danger of drawing lead dust into their lungs. House painters and colour grinders on an average are annually treated in a hospital 21.2 days; varnishers, 19.8; glass workers, 19.6; bristle cutters, 19; iron foundries, 14; coppersmiths, 13.1; lead workers, 12.4. The danger of these latter have greatly decreased since the lead is broken by machinery and immersed in water or oil.

In the annual report drawn up by the Superior Work Commission of Factories and Workshops concerning the observance of the law of the 2nd November, 1892, regulating the labour of children in factories, etc., it is stated that in the majority of the factories and workshops the regulation forbidding children under 13 to be employed is observed in the glass, cord, and brick factories. There are some exceptions, and the inspectors have been directed rigorously to enforce this regulation wherever its non-observance exists. There are some legal exceptions to this rule; these, of course, will be respected. Under the following conditions children who have passed their twelfth year, but not attained their thirteenth can legally be employed in factories and workshops. They must have obtained the certificate of primary education, a proof that compulsory education under these circumstances is terminated, and employment in a factory, even if arduous, the State considers preferable to vagabondage. This certificate, coupled with a medical certificate stating that the child is physically capable of working, allows the above law to be set aside. The inspectors state that the number of children working in factories under these conditions has greatly diminished during the last year. The medical certificate is given gratis, either by a medical school inspector or by a duly appointed medical inspector of infantile life, or by any medical man appointed to fill a State medical post, and indicated by a prefect. This examination is compulsory and cannot be avoided by children under 13 years of age; for children beyond 13 years of age and under 16 it is voluntary, not compulsory. The work inspectors have the responsibility of eliminating among children those that are sick, weakly, or incapable of doing the work set them; in some cases, instead of sending the child away from the factory he directs the superintendent to give lighter labour more in proportion to its strength, specifying precisely the character of such labour. Unfortunately the practice of giving medical certificates meets with many difficulties in several departments; the directions sent by the prefects to the mayors, which leaves their conscience clear, are often neglected by these latter. It is said that the municipalities are more guilty in the matter than the mayors. The Superior Work Commission wishes the inspectors to be in direct personal communication during their inspection tours with the municipal authorities and thus verbally acquaint them with the results of their inspection. In France the authority of the work inspectors does not extend to what may be called family workshops where a whole family, father and children, suffice without any other hands. In this respect the French differs from the English law. The French State argues that the father and mother or guardian, guided by affection, etc., would not exact more work than can be healthily done by the children. In such cases when this natural affection is wanting, the law of July 24th, 1892, is put in force, which makes

parents responsible for ill-treating their children. Overworking children to the detriment of their health and development would be considered ill-treatment in the sense of the law of 1889. Family workshops or factories where boilers and machinery are used fall under the jurisdiction of the inspectors; they are classed among the dangerous and unhealthy dwellings, and are overlooked in order to secure sanitation and avoid risk of accidents endangering human life. The French law defines family workshops within narrow limits—father, mother, and their descendants. All other relations are reckoned as strangers; their presence as hands, or even that of one stranger, brings the workshop within the jurisdiction of the law, and it is inspected by the work inspectors.

M. Rochard, one of the partners in the well-known firm of the Belle Jardinière, was a member of the Conseil de Surveillance of the Assistance Publique, and has bequeathed to it his immense fortune, valued at £72,000.

Madame Davaine, widow of the well-known scientist, has bequeathed part of her fortune to the Assurances and her estate at Garches to be used as a convalescent home for girls leaving the hospital.

CORRESPONDENCE.

HEALTH OF ARMY MEDICAL OFFICERS IN INDIA.

SIR,—If you will kindly allow me a little of your valuable space I would like to make a few remarks on the unsatisfactory condition of the health of the army medical officers in India, with a few suggestions for its amelioration. It cannot be denied that there is a great amount of sickness and invaliding in the Army Medical Staff. Statistics which might be procured from the Medical Department of the War Office would abundantly confirm this statement. I will point out some of what I consider to be the chief causes of ill-health.

1. Want of employment in the plains in hot weather. I daresay there will be a great outcry at this statement, but it is perfectly true nevertheless. I exclude cholera epidemics, which are fortunately rare. I have been seven years in India, and most certainly have done my share in many stations, but I never yet had enough to do, and I am no glutton for work. Large numbers of soldiers are sent to the hills every hot season with the result that work in the plains is materially diminished. I am sure the average executive medical officer could not honestly say he does three solid hours' work a day throughout the year. I do not count chatting and smoking in the office. I do not mean to say there are too many medical officers in India, because when a Chitral expedition occurs it leaves us short-handed.

2. Want of leave. Though medical officers stop down in the plains doing next to nothing half of them might be on leave, and it is greatly their own fault that they are not. Some of them will not go themselves, and will not allow anyone else to go if they can help it. I knew one young medical officer who would not go on leave because having only about eighteen months in the service, and it being his first hot weather in India, he was offered the middle two months (rains). He said, "What is the good of going on leave in the rains?" The same officer was very averse to a comrade going on leave as he would have a certain number more patients to attend to, the large number being venereal cases, which do not demand an enormous quantity of time or brain power. This is how there is such a difficulty about leave; a man complains if he is asked to do about one-fifth part of the work of a civil surgeon of the Indian Medical Service.

Having little or nothing to do the young medical officer crawls home just as it is beginning to warm up, and sleeps away half the day, thereby developing a liver or other maladies. If he would only follow the example of the young subaltern, who is usually poorer than he, and keep a decent polo pony, and play at any rate twice a week, you would not hear of so much sickness. If too stout or too old to play polo, he can play something else. Touching polo, I am bound to say that many of the seniors do not encourage polo or any other games which bring medical officers before the public. Some of them have been known to say that they think medical officers should "efface themselves." Oh, im-

pressive phrase! Some years ago there was a celebrated medical polo team not 1,000 miles from Quetta, but it was broken up by a high and sapient medical authority, now happily departed to the retired list, as he thought the game brought medical officers too much in "evidence." I remember Sir Joseph Fayer saying at Netley that he had spent the best years of his life in India, and he considered it a very healthy country provided one took care of oneself. After seven years' experience of India I cordially endorse his remarks, at all events as regards the majority of stations for British troops. If a man avoids undue exposure to the sun by wearing a suitable head covering, is moderate in eating and drinking, takes plenty of exercise and avoids chills afterwards, I believe it quite possible to spend six healthy, happy years in India, and for him to return as fit as or fitter than when he left his native England.—I am, etc.,
IDRX.

THE GENERAL PRACTITIONERS COMMITTEE AND MEDICAL DEFENCE.

SIR,—As one who on this question hailed with satisfaction the interim report of the Committee, and as one who thought that the arguments they adduced adverse to the policy of the Association's undertaking medical defence made it desirable, at least, that more time for deliberation should be given before proposing a resolution of dissent, I should like to suggest that Dr. Welsford and those who are acting with him should advance:

1. Arguments for not accepting the contention of the Committee of the difficulties attending the prosecution of defence work over so wide an area of the globe as the Association extends.

2. Why they think that the Association is the only body that can adequately undertake medical defence; and why they think it would be better carried out by them than by a reconstituted General Medical Council and an independent defence union?

For myself, I regard medical defence as comprising three separate branches of work, each, as I think, better committed to separate bodies, namely:

1. The prosecution of quackery, and all such illegal or derogatory practices as could be brought under the ban of definite rule. This work I think, properly belongs to the General Medical Council; and I was more pleased than I can tell when I read the paragraph in the Committee's report, criticising the constitution and field of action of that inert and useless body.

2. Medical defence proper as applied to individuals, for which a system of insurance is such a boon, and is best, I think, undertaken by a distinct organisation.

3. The combating of the evils arising from excessive competition, such as underselling and other breaches of proper professional conduct; this, it seems to me, is perhaps the most serious subject of all, on account of the hardship it inflicts on many of the poorer members of the profession, and of the obvious difficulty in dealing with it. It is clear that there are minor offences which could never be brought under the ban of definite rule, and therefore could not be dealt with by any judicial body. I see little light as yet as to how these evils are to be thoroughly grappled with, but I endorse the recommendation in the Committee's report for formation of local ethical committees as the first step towards effecting good in this direction. What is most urgently needed to further these ends is the help and interest of the senior and more independent members of the profession; and while I am at present unable to subscribe to the rider which Dr. Welsford moved to the Committee's report, I regard with the greatest satisfaction the energy, determination, and ability with which he is prosecuting a cause which concerns the honour and interests of the whole profession.—I am, etc.,
Bournemouth, Aug. 6th. H. GRAHAM LYS, M.D.

SCOTCH SCHOOLS AND PRACTICAL MIDWIFERY.

SIR,—In the report of the second general meeting of members on Wednesday, July 30th, I am surprised to find Mr. Wheelhouse credited with the statement "that the necessities of the Scotch schools made three labours sufficient for each student to pass in midwifery." I am not aware that this is so, but so far as graduation in Glasgow University

is concerned, a student is required before attending midwifery cases either to have had a systematic course of midwifery or to have passed a special examination on the phenomena and management of labour, natural and otherwise. He must then attend no fewer than twelve cases, three of which are under the direct supervision of a qualified medical man. In the event of an unnatural or difficult case occurring after the first three, the student is instructed to call in a qualified practitioner to assist.

As an old student of the late Professor Leishman, I can confidently assert that while he valued personal supervision, he held strongly that no student could attend too many cases prior to qualification.

As the discussion on this point seems to throw discredit on Scotch schools, and on Glasgow in particular, I hope, for the honour of the University, this will not be allowed to pass unnoticed.—I am, etc.,

Killamarsh, Rotherham, Aug. 5th.

THOS. DIVINE, M.B. Glasg.

TEST FOR COLOUR BLINDNESS.

SIR,—At the present time, when there appears a likelihood of the colour-blind question being settled, I think it my duty again to draw attention to the inefficiency of Holmgren's test. This test has been recommended by men of the highest attainments in science in the departments which they represent. This makes it all the more difficult for an obscure individual like myself to obtain a hearing. But we must not make the opinions of the most eminent men subversive of facts, or there would be an end to all progress.

Since the publication of my book, many of those who opposed me most vigorously have published cases in support of my views.

Strange as it may seem, the report of the Royal Society contains internal evidence that Holmgren's test is not a trustworthy one. On page 116 of the report a summary of the colour-blind cases detected is given. With Holmgren's test Mr. Mellish passed one colour-blind person, and Captain Abney four. It will also be noticed that No. 69 was rejected by Mr. Mellish with Holmgren's test, and passed by Captain Abney also with Holmgren's test.—I am, etc.,

Hendon, August 13th.

F. W. EDWARDS-GREEN.

MEDICAL MISSIONARIES AND PRIVATE PRACTITIONERS.

SIR,—I wish to enter my protest against the action of a Colonial Missionary Society here. On its staff are two doctors, who treat gratis everyone who attends their dispensary or calls them out. They ask no fees from anyone, but any presents they get from their richer clients are put into the Society's treasury.

A native practitioner and a member of the British Medical Association complains bitterly to me of their action, and says he is not now able to support his family through the Society's action.—I am, etc.,

Rajputana, India, July 15th.

VINDEX.

THE REGISTRATION OF NURSES.

SIR,—My object in rising to speak during the debate upon the Midwives' Registration Bill at the general meeting on July 30th was to inquire if resolutions passed at an annual meeting had any authority under the rules of the Association.

Twice—in 1891 and 1893—the members assembled in annual meeting have decided, in effect, that all nurses, whether medical, surgical, midwifery, or mental, should be under the complete control of the medical profession in the performance of their duties. In 1891 the annual meeting instructed the Council to determine and report in what manner this could best be attained. The same resolution would have been moved at the 1892 meeting, when complaint was made that the Council had not reported upon the subject, but it was ruled out of order. At the Newcastle meeting in 1893 complaint was again made that there was no report, and it was admitted the resolutions had not been taken into consideration by the Council. It was once more affirmed, and the President pledged himself it should this time be considered.

In the spring of 1894 I was informed the resolution had been considered and the Council could not act upon it.

My opinion is, the Council are within their right in ignoring the unanimous resolution of an annual meeting, however discourteous it may seem. If they are within their right in so doing, it is not just to accuse them either violently or otherwise.

It would be well, perhaps, if the Council would cause the rules of the Association to be printed in the *BRITISH MEDICAL JOURNAL*. I think they ought to do so, more especially as there was every probability of any rules of the Association which exist being the subject of discussion in the law courts three years ago. A member of our powerful Association was standing alone in serious trouble at that time, because he had read the Memorandum of Association without the interpreting rules of the Association. The Memorandum of Association states that the meetings of the Association are to be meetings of members of the British Medical Association and of other medical men. Relying on this the member referred to concluded he was privileged in speaking in annual meetings, but he was not so privileged because laymen were present, which he did not know, in obedience, of course, to the rules appertaining to annual meetings. It may be thought he was rightly punished for not reading the rules, but he could not obtain a copy of them. He would very much like to see them now, for lawyers say rules are *ultra vires*, which do not accord with the Memorandums of Association.

Returning to the subject of nurses, I hold it is wrong in principle to make any distinction between the different classes of nurses either as regards control or efficiency. I believe a simple system of registration of nurses by the medical profession is the only practical method of obtaining control; and I consider the British Medical Association the only body in the profession which can conduct such a registration. This may be as readily done through the districts and Branches as the registration of the members of the Association, which is so done. The only serious additional labour would rest with the districts, the meetings of which would have to judge of the credentials of the nurses applying for registration. It would be worth the trouble if we could regulate and render more efficient one of the most important aids we possess in our responsible calling. And we should feel it to be worth a great deal more. We should then do our duty to the nurses without stint. We should not permit one of our registered nurses—for she would not remain on the register if found unworthy—after a life of hardship and drudgery in helping us to do our work, to die a pauper. If we gave up the odd shilling of our subscription we should have a pension fund of £800 a year; or, if that were impracticable, who amongst us would grudge an extra shilling subscription to this end? It would amount only to thirty shillings in a medical lifetime, and who would not give that any day if one of the good, true, self-sacrificing, gentle, well-trained women we all know, and who are often the greatest comforts we have in an anxious case, were in poverty?—I am, etc.,

Carlsbrooke, Isle of Wight, Aug. 5th.

J. GROVES.

THE WEST SOMERSET BRANCH OF THE BRITISH MEDICAL ASSOCIATION.

SIR,—With reference to the passage in the *BRITISH MEDICAL JOURNAL* of August 3rd, page 392, in which Dr. Mackenzie is reported to have said that he represented "Devon and Somerset," I am requested by Dr. Mackenzie to say that the words he used were "Devon and Cornwall." He did first say "Devon and Somerset," but corrected himself at once. We must thank Dr. Kelly for drawing attention to the mistake.—I am, etc.,

Exeter, Aug. 13th.

W. GADSDON, Honorary Secretary, South Western Branch.

FILTHY RAILWAY CARRIAGES.

SIR,—Let me ask your assistance in removing a possible source of danger to public health, and in remedying a state of things existing in our midst highly discreditable in this age of sanitary progress.

The condition of some of the carriages on that section of the London, Brighton, and South Coast Railway running

from Victoria to London Bridge *via* Sydenham, by which I have of late been frequently obliged to travel, is very disgraceful. Their filthy condition suggests that they are rarely washed or cleaned, and the favourable soil that their dirt affords for the accumulation and possible development of noxious germs can be imagined.

Is there no sanitary authority responsible for the inspection of these carriages? In one case within my knowledge representations have been made, but apparently without effect.—I am, etc.,

August 15th.

OBSERVER.

NAVAL AND MILITARY MEDICAL SERVICES.

ARMY MEDICAL STAFF EXCHANGE.

The charge for inserting notices respecting Exchanges in the Army Medical Department is 3s. 6d., which should be forwarded in stamps or post office order with the notice. The last post on Wednesday is the latest by which these announcements can be received.

A SURGEON-MAJOR expecting to be ordered abroad late this trooping season wants to exchange with an officer at the bottom of the roster for home service. Apply, Alpha, Belmont, Queenstown.

THE NAVY.

STAFF-SURGEON JOHN D. HENWOOD has been appointed to the *Devastation*, August 5th; and Surgeon WALTER BOWDEN, D.S.O., to the *Urgent*, August 15th.

THE ARMY MEDICAL STAFF.

The following is the list of successful candidates for commissions in the medical staff of Her Majesty's army at the recent examination in London:

Names	Marks.	Names	Marks.
Brereton, F. S. ...	2,685	Vaudin, M. L. M. ...	2,913
Statham, J. C. H. ...	2,684	Ward, W. A. ...	2,167
Probyn, P. J. ...	2,686	Forrest, E. G. ...	2,683
Cooper, R. M. de H. ...	2,686	Hooper, A. W. ...	2,695
Waring, A. H. ...	2,914	Hayes, E. C. ...	2,601

Brigade-Surgeon-Lieutenant Colonel J. H. HUGHES, M.D., is promoted to be Surgeon-Colonel, *vice* S. Archer, retired, July 5th. Surgeon-Colonel Hughes was appointed Assistant-Surgeon, September 30th, 1864; Surgeon, March 1st, 1873; Surgeon-Major, September 25th, 1878; and Brigade-Surgeon-Lieutenant Colonel, June 4th, 1889, having attained the rank of Lieutenant Colonel, September 5th, 1884. He served with the 2nd Field Hospital during the Ashanti war in 1873-74, and received the medal with clasp.

Surgeon-Colonel W. TAYLOR, M.D., has been appointed Principal Medical Officer, South-Eastern District.

Surgeon-Lieutenant Colonel R. EXHAM is promoted to be Brigade-Surgeon-Lieutenant Colonel, *vice* R. S. Mackay, deceased, July 5th. Brigade-Surgeon-Lieutenant Colonel Exham entered the service as Assistant-Surgeon, April 1st, 1873; became Surgeon, March 1st, 1878; Surgeon-Major, April 1st, 1883; and Surgeon-Lieutenant Colonel, April 1st, 1891.

Surgeon-Lieutenant Colonel J. McNAMARA, M.D., also is promoted to be Brigade-Surgeon-Lieutenant Colonel, *vice* J. H. Hughes, M.D., July 5th. Brigade-Surgeon-Lieutenant Colonel McNamara's previous commissions are contemporaneous with those of Brigade-Surgeon-Lieutenant Colonel Exham. Brigade-Surgeon-Lieutenant Colonel McNamara was in medical charge of the troops (detachments of Royal Artillery and 10th Foot) sent into the Native State of Senghe Pong, Malay Peninsula, in 1874; and was present at the attack and capture of the Kapayan stockades (medal with clasp). In the Afghan war in 1880, and in medical charge of Brigadier-General Brooke's brigade covering the retreat from Malwand (mentioned in despatches), took part in the defence of Candahar, and present at the battle of Candahar (medal with clasp), and in the Soudan Expedition in 1889 under Sir Gerald Graham, being present in the engagements at El Tob and Temal (mentioned in despatches, medal with clasp, and Khedive's Star).

The undermentioned surgeons on probation are appointed Surgeon-Lieutenants July 26th: LIONEL FERGUS SMITH, M.B.; ROBERT JAMES BLACKHAM, SCOTTUS HAROLD FAIRRIE, M.B.; GEORGE T. K. MAURICE, RUPERT FAUSSETT, JOHN VINCENT FORREST, M.B.; HENRY WILLIAM GRATTAN, FRANCIS ERNEST GUNTER, JOHN HAY CAMPBELL, JOHN GRECH.

ARMY MEDICAL RESERVE.

SURGEON-LIEUTENANT H. W. JOYCK, 2nd Volunteer Battalion the Buffs (East Kent Regiment), to be Surgeon-Lieutenant, August 14th.

INDIAN MEDICAL SERVICE.

BRIGADE-SURGEON-LIEUTENANT-COLONEL and temporary Surgeon Colonel W. R. HOOPER, late Bengal Establishment, is granted the temporary rank of Surgeon-Major-General, August 14th. It will be remembered that Surgeon-Major-General Hooper retired from the service in January last, and has been since appointed President of the Medical Board at the India Office.

Surgeon-Lieutenant Colonel C. J. W. MEADOWS, Bengal Establishment, is promoted to be Brigade-Surgeon-Lieutenant Colonel, April 1st. He was appointed Assistant-Surgeon, October 1st, 1869, and Surgeon-Lieutenant Colonel, twenty years thereafter. He was with the Lushai Expedition in 1871-72, was mentioned in despatches, and has received the Frontier medal with clasp.

Brigade-Surgeon-Lieutenant Colonel JAMES FORBES BARNETT, Madras Establishment, died at Durgul on July 25th, from abscess on the liver. Dr. Barnett, who was in medical charge of the 4th Lancers Hyderabad Contingent, was born in 1834, and received his first appointment as Assistant Surgeon in 1858, and became Brigade-Surgeon-Lieutenant Colonel, May 21st, 1890.

The death is also announced of Brigade-Surgeon JOHN PROUDHON STATION, late of the Bombay Establishment, who took part in the Indian Mutiny campaign, also acting as political officer with the columns under Brigadier-General Wheeler in the expulsion of the rebels from Bundelcund. He retired in 1860, and died in London on August 8th, aged 66 years.

THE VOLUNTEERS.

MR LEONARD FRANK HOUGHTON is appointed Surgeon-Lieutenant in the 1st Cornwall (Duke of Cornwall's) Artillery (Western Division Royal Artillery), August 14th.

Surgeon-Lieutenant F. R. GRIFFITHS, M.B., 2nd Glamorgan Artillery, has resigned his commission, August 14th.

Second-Lieutenant G. A. SKINNER, 1st Sussex Engineers, Fortress and Railway Forces, is appointed Surgeon-Lieutenant in the same corps, August 14th.

Surgeon-Lieutenant W. A. ATKINSON, M.B., 1st Surrey (South London) Rifles, is promoted to be Surgeon-Captain, August 14th.

CHANGES OF STATION.

The following changes of Station amongst the officers of the Army Medical Staff have been officially notified to have taken place during the past month:

	From	To
Brig-Srg. Lt.-Col. J. H. Hughes, M.D. ...	Strathgellimts.	Devonport.
" R. C. Heaton ...	Bengal ...	Bombay.
" W. E. Saunders ...	"	"
" W. J. Charlton ...	"	Punjab.
Surgeon-Lieut.-Col. W. P. Bridges ...	Weedon ...	Landguard Fort.
" J. Ring ...	"	Punjab.
Surg.-Major P. J. Dempsey, M.D. ...	"	Bengal.
" A. Keogh, M.D. ...	Madras ...	"
" S. J. Flood ...	Colchester ...	Weedon.
" O. Todd, M.B. ...	"	Bengal.
" P. M. Carleton, M.D. ...	Madras ...	Punjab.
" J. O. G. Sandford, M.D. ...	Glenbeigh ...	Cork.
" H. Saunders ...	"	Punjab.

" A. E. Milner ...	Portsmouth ...	Gosport.
" H. W. Vaughan-Williams, M.B. ...	Cork ...	Kilkenny.

THE INDIAN MEDICAL SERVICE AND THE SANITARY NEEDS OF INDIA.

On this subject the *Medical Press and Circular* has the following remarks: "Mr. Ernest Hart's recent visit to India enabled him to form very definite conclusions upon many subjects, but his outspoken remarks in the Session of Public Health, at the recent meeting of the British Medical Association, with respect to the present position of the officers of the Indian Medical Service, should not be allowed to pass without notice. He said: 'Two things struck me in India—the remarkable ability, the enormous power of work, and the excessive overwork of the Indian medical officers, the terrible servitude which enforces on them the attempt to perform a vast mass of duties which cannot be performed, and

the lamentable results of the domination of really able young officers by effete, ignorant, and worn-out superiors, who have risen by mere seniority to positions which, essentially and administratively, they are quite incapable of fulfilling by reason of their age and of the antiquated state of their information, if even many of them had ever possessed at any time the qualities or the inclination necessary for such posts. Worst of all, perhaps, is the elevation to the very highest offices, by mere lapse of time and military rules of promotion, of men who are most capable of fulfilling routine duties, but are wholly unfitted to be trusted with the administration of the health and lives of the vast population depending on us in India. The testimony here given of the duties required of the officers of the Indian Medical Service, and of the hardness of their lot, should be borne in mind by the young practitioners in this country who are desirous of competing for the appointments in connection therewith. The cry has long been that the officers of the Indian Medical Service are overworked—if not in some instances 'sweated'—and the grievance is one into which expediency demands that inquiry should be made."

THE ARMY MEDICAL SCHOOL.

At the conclusion of the seventieth session and Final Examination at Netley four of the candidates failed to qualify, two of the British and two of the Indian Medical Service.

POSTINGS OF MEDICAL OFFICERS.

SERGEON-COLONEL W. TAYLOR proceeds to Dover as Principal Medical Officer, and Brigade-Surgeon-Lieutenant-Colonel HUGHES to Devonport on promotion to administrative rank.

PAY IN THE INDIAN MEDICAL SERVICE.

The following rules have been laid down for the grant of pay to a Brigade-Surgeon-Lieutenant-Colonel of the Indian Medical Service during the period he is attached to the office of a Principal Medical Officer, for the purpose of acquiring a knowledge of military medical administration. 1st. In cases where it is practicable to attach the officer to the office of a Principal Medical Officer without his relinquishing his civil duties, his full civil pay will be continued to him. 2nd. In cases where the officer has been obliged to relinquish his civil duties he will be allowed the grade pay of his rank, together with half the difference between that grade pay and the substantive pay of his civil appointment, the whole to be a charge against the military estimates.

MEDICO-LEGAL AND MEDICO-ETHICAL.

INFECTION BY A MIDWIFE.

THE Blackburn and District Coroner (Mr. H. J. Robinson) held an inquest on August 7th at Blackburn Town Hall on the body of Mary Jane Talbot, who died as the result of confinement on August 3rd. In the course of his evidence Dr. G. R. Wilson stated that he visited deceased at 7.30 on Saturday morning after the child was born. He found deceased suffering from septicaemia, or blood-poisoning, from which she died. With regard to that disease he said it was exceedingly catching. It was often brought by neglectful persons but might arise from bad drains. He did not perceive any bad drains in the house. The usual cause was persons attending confinements without due disinfection. If any woman in the house had attended another woman suffering from that complaint during the last week or two he should take it as positive proof of the way deceased got the disease. Joseph Wilson gave evidence as to his attendance at the birth of the child. There were three women present, one being a midwife. It was not necessary for any instruments to be used. Dr. James Winstley, Medical Officer of Health, stated that deceased's death was from septicaemia. It was extremely likely to have arisen from two women going straight from one case to the other without disinfecting. Further evidence having been given a verdict was returned to the effect that deceased had died from the blood-poisoning following confinement probably caused by the midwife going directly from one case to another without due disinfection.

PRESCRIBING CHEMISTS.

AT the Limehouse Townhall on August 15th, Mr. Wynne Baxter held an inquiry respecting the death of George William Clark, aged 13 months, the son of a bargeman, living at Galt Street, Bromley. The mother of the child stated that the deceased and another of her children had been suffering from measles. She sent her sister to a chemist on August 5th for some medicine, but the chemist told her that he would come and see the child. He did so. He looked at the child and told them to fetch some medicine, which they did. He called again at 10 o'clock the same night and sent some more medicine. The following morning the child seemed worse, and the witness sent again for the chemist, but he refused to come, and said, 'Put my medicine out of sight and go for Dr. Haddock, and don't mention a word that I have been here.' The witness sent for Dr. Haddock, but the child died before his arrival. The witness and her husband thought the chemist was a qualified man, and first heard of him through his attending a woman next door for rheumatic fever and other patients in the street. The witness understood the name of the chemist to be Whitson or Wilmer, and he lived at 111, Salmon's Lane. John Charles Pidgeon stated that he was a chemist's assistant, and had never passed any examination. He was employed by Mr. Wilmer, a registered chemist and druggist, and Mr. Wilmer knew that he went out to visit patients. The witness added that he had attended one sick and dying for six years in ten different districts in London. The Coroner: Then the sooner you give it up the better for everybody. Are you aware that through any want of skill on your part you might stand at the Old Bailey for manslaughter? The Witness: I am fully aware of it. The Coroner: Then in the face of such a statement I am sure no one would have mercy on you. The witness denied that he told the mother to hide the medicine, but on being

confronted with Mrs. Evans he hesitated in denying it. He added that he never charged anyone for anything, and got his living by his skill. The Coroner: What is that, pray? The Witness: Converting tea leaves into anything. It would surprise anyone to see what I can make out of tea leaves. The Coroner: But that does not give you the right to pose as a doctor. The Witness: I know what I am doing, and I only live to do good for others, and if I do wrong I will stand the risk. Public opinion I care not for, but before I go I leave this (throwing it on the table) for the husband; he's been out of work for weeks, and needs it. The Coroner: Do you make any medicines of tea leaves? The Witness: No, sir. The Coroner: (turning to the jury) Why, this smells strongly of tea. Dr. Haddock observed that the child died of bronchitis. The medicine given appeared to be very strong and harmless. The Coroner, in summing up, said the jury could do very little in this case, as Dr. Haddock could not say any harm had been done by the medicine. According to the law anyone may prescribe, but they do so at their own risk. The law does not prevent them from attending and giving medicine. The jury gave a verdict of "Natural Death," and requested the coroner to write to Mr. Wilmer, calling his attention to the risk his assistant was daily running.

NEWSPAPER PARAGRAPHS.

KEIGHLEY.—Professionally anxious to honourable practitioners as such a sensationally erroneous report in the local press as that referred to would naturally be, we do not see what more our correspondents can reasonably be expected to do in vindication of honest and of the moral obligations devolving upon an ethically jealous faculty in view of the fact that he has not only interviewed the editor and protested against the objectionable article, but written a repudiating explanatory note to his local medical brethren. Such we deem to be professionally adequate for the incorrectly assumed ethically immoral proceeding of the practitioner in question.

UNIVERSITIES AND COLLEGES.

UNIVERSITY OF LONDON.

INTERMEDIATE EXAMINATION IN MEDICINE.—PASS LIST:
Entire Examination.—First Division: W. R. Batty, B.Sc., University College, Bristol and London; Janet Wedderburn Carr, London School of Medicine for Women; H. Bartley, Owens College, Manchester; Alice Mary Hawker, London School of Medicine for Women; H. Hine, Middlesex Hospital; E. D. Singer, St. Thomas's Hospital; F. H. Thiele, University College; W. R. E. Wood, Mason College. Second Division: E. W. Adams, Sheffield Medical School and Firth College; F. A. Arnold, London Hospital; C. H. Benham, University College; T. P. Berry, Guy's Hospital; F. Brickwell, St. Bartholomew's Hospital; J. Broadley, Yorkshire College; E. A. Bull, Westminster Hospital; A. J. Cleveland, Guy's Hospital; R. M. Cowie, King's College; D. L. F. Davies, Middlesex Hospital; R. O. Field, Yorkshire College; G. M. Harston, Charing Cross Hospital; T. A. Hawkesworth, King's College; W. J. Hirst, Yorkshire College; H. H. Jamieson, St. George's Hospital; H. S. Jenkins, University College, Bristol; J. D. Jenkins, London Hospital; A. C. Leaning, St. Mary's Hospital and Birkbeck Institute; F. Evans, Annie Leete, London School of Medicine and Birkbeck Institute; C. D. Lindsey, St. Mary's Hospital and Birkbeck Institute; Marion Sandford Linton, B.A., London School of Medicine for Women; F. S. Lloyd, St. Mary's Hospital; J. Mooney, Owens College; J. B. Page, St. Mary's Hospital; Mary Nona Sharman, Glasgow University and London School of Medicine; J. H. Sheldon, Owens College; A. B. Smallman, Owens College; J. E. Smith, University College, Liverpool; S. M. Smith, St. Mary's Hospital; J. M. G. Swainson, Westminster Hospital; E. Taunton, University College; W. H. M. Telling, Guy's Hospital; A. G. Telford, University College, Dundee, and Queen's Hospital; W. F. Tynan, St. George's Hospital; Eliza Turner Watts, London School of Medicine for Women; H. E. White, Mason College; C. E. Whitehead, St. Mary's Hospital; W. D. Wiggins, St. Mary's Hospital; P. G. S. Williams, University College; A. G. Wilson, London Hospital; W. Wright, Owens College.
Excluding Physiology.—First Division: W. T. Rowe, St. Bartholomew's Hospital; H. H. Scott, St. Thomas's Hospital; G. R. Thwaites, St. Thomas's Hospital; J. G. Wallis, London Hospital. Second Division: H. T. S. Aveline, Bristol Medical School and Clifton Laboratory; F. V. O. Bell, St. Bartholomew's Hospital; A. B. Cridland, Bristol Medical School and Clifton Laboratory; G. B. Crisp, St. Mary's Hospital; I. E. O. Handson, Guy's Hospital; J. L. Jones, University College; J. A. Mawson, Yorkshire College; H. A. Schellberg, St. Bartholomew's Hospital; S. E. Smith, Westminster Hospital; W. S. V. Stock, University College, Bristol, and Clifton Laboratory; L. Whitfield, Mason College; E. W. Woodbridge, St. Bartholomew's Hospital.
Physiology only.—First Division: A. E. Baker, Middlesex Hospital. Second Division: J. A. P. Barnes, St. Bartholomew's Hospital; P. B. Blitchley, Middlesex Hospital; W. N. East, Guy's Hospital; E. S. Hall, Guy's Hospital; E. L. Hunt, St. George's Hospital; E. Landow, St. Mary's Hospital; H. J. Marriage, St. Thomas's Hospital; J. L. Maxwell, St. Bartholomew's Hospital; P. W. Moore, Guy's Hospital; J. W. Winterburn, St. Thomas's Hospital.
ANATOMY.—First Class: S. H. Paine, Guy's Hospital; and G. E. Walker, Guy's Hospital. Second Class: W. A. Dewar, York College, and E. R. Sheridan, B.Sc., Westminster Hospital. Third Class: E. C. Morland, B.Sc., Owens College and St. Bartholomew's Hospital; M. Dixon, B.Sc., University College; and H. E. Hewitt, St. Thomas's Hospital.

Physiology and Histology.—First Class: *E. C. Morland, Owens College and St. Bartholomew's Hospital; H. Kelsall, Owens College; and F. E. Walker, Guy's Hospital. Second Class: J. F. Dolson, Yorkshire College, and C. Tykes, University College (equal); E. B. Sherlock, Westminster Hospital; and G. E. Richmond, B.A., R.Sc., Guy's Hospital and King's College. Third Class: Mary Frances Cornford, London School of Medicine and University College, and F. Turner, B.Sc., Guy's Hospital (equal).

Organic Chemistry.—First Class: *R. W. C. Pierce, R.Sc., St. Thomas's Hospital. Second Class: P. Turner, Guy's Hospital; W. T. Milton, Guy's Hospital; E. C. Morland, Owens College and St. Bartholomew's Hospital; E. B. Sherlock, Westminster Hospital; and G. E. Richmond, Guy's Hospital and King's College. Third Class: H. W. Bruce, Guy's Hospital; and D. N. Nabarro, R.Sc., University College.

Medical Botany and Pharmaceutical Chemistry.—First Class: *P. Turner, Guy's Hospital; E. B. Sherlock, Westminster Hospital; W. T. Milton, Guy's Hospital, and F. E. Walker, Guy's Hospital. Second Class: R. W. C. Pierce, St. Thomas's Hospital; T. H. Gardner, King's College; H. E. Hewitt, St. Thomas's Hospital. Third Class: H. W. Bruce, Guy's Hospital; Mary Frances Cornford, London School of Medicine and University College; and G. H. Fagg, Guy's Hospital.

* Exhibition and Gold Medal.

† Gold Medal.

‡ Obtained the number of marks qualifying for the Exhibition.

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION: PASS LIST.

Native Examinations.—First Division: W. F. Addy, University College; J. C. M. Bailey, St. Bartholomew's Hospital; A. W. Bartlett, University College, Aberystwith; H. F. W. Boedicker, King Edward High School, Birmingham, and Mason College; C. H. Bullen, Mason College; J. A. Butler, Guy's Hospital; P. W. L. Camps, Guy's Hospital; T. C. English, University Tutorial College; Harriet R. D. Ford, Owens College; W. O. Greenwood, private study; Louisa Hamilton, University College; G. W. Hare, Guy's Hospital and Denton House; E. G. Johnson, University College, Bristol; B. W. Jones, King Edward High School, Birmingham, and Mason College; Jessie Augusta Lewin, University Tutorial College; Olive McQuillan, Owens College; D. J. McGavin, King Edward High School, Birmingham, and Mason College; J. E. Martin, Middlesex Hospital and University College; E. B. Mason, Mason College; A. S. Parkinson, Yorkshire College; C. B. Penny, Guy's Hospital and Alwyne Institute; C. A. S. Ridout, St. Bartholomew's Hospital; B. H. St. C. Roberts, University Tutorial College and private study; R. Rutherford, University Tutorial College and private study; J. W. S. Seemore, private study and St. George's Hospital; C. D. Soutter, King Edward High School, Birmingham, and Mason College; C. Thackeray, Firth College; Gisela Wilmerdschier, University Tutorial College; G. T. Wrench, Guy's Hospital. Second Division: Emily Monaghan, Barnet, Bedford College, London; F. G. A. Roth, St. Mary's Hospital; G. H. Brodribb, St. Mary's Hospital; F. C. Carlé, King's College; H. Collinson, Yorkshire College; L. Cook, Westminster Hospital and private study; L. E. Dickson, University College, Liverpool; F. R. Edwards, King Edward High School, Birmingham, and Mason College; A. G. Elliot, University College; W. T. Evans, University College, Cardiff; A. Fox, Queen's College, Cork, and private study; A. Freear, St. Mary's Hospital; Caroline Lillian Gale, University College; D. G. Greenfield, Guy's Hospital; L. H. Guest, Owens College and private study; C. F. Günther, B.A., Firth and University Colleges; Florence Elizabeth Hampshire, Yorkshire College; W. C. Hirst, Yorkshire College; E. W. Holyoak, Wyggeston School; J. W. Hunt, St. Mary's Hospital; Mary Hannah Frances Ivens, University Tutorial College; Sophia Bangham Jackson, University College, Aberystwith; H. W. James, University College, Cardiff; A. H. John, St. Bartholomew's Hospital; E. W. Jones, Mason College and private study; W. J. Law, Firth College and Kingswood School; G. Lowin, City of London School and University Tutorial College; A. E. J. Minter, St. Bartholomew's Hospital; B. R. Lloyd, University College, Cardiff; F. W. Longhurst, University College and private study; J. C. Marshall, St. Bartholomew's Hospital and private study; G. Maw, University College; J. P. May, St. Bartholomew's Hospital and Central Foundation School; Annie Mooney, Owens College; H. McD. Parrott, Guy's Hospital and Carleton College; Mary Elizabeth Phillips, University College, Cardiff; A. T. Pridham, St. Bartholomew's Hospital; M. F. Reaney, London Hospital; E. F. Reeve, Aske's Schools, Hatching; B. E. Reynolds, University Tutorial College, Birkbeck Institute, and private study; Catherine Mary Richardson, Durham College of Science, Newcastle-on-Tyne; Hilda Mallinson Rowntree, University College; H. Scholefield, Owens College; E. D. Smith, St. Bartholomew's Hospital; W. L. Stuart, King's College; J. Tattersall, Birkbeck Institute and University Tutorial College; Barbara Tchaykovsky, North London Collegiate School and Bedford College; R. I. Thornley, St. Bartholomew's Hospital; F. E. Wolchman, University Tutorial College and private study; Sibyl Tate Widows, Dulwich High School and University Tutorial College; P. R. Wrigley, Owens College.

Honours Candidates recommended for a Pass.—W. B. Fry, St. Thomas's Hospital; J. S. Williamson, St. Bartholomew's Hospital.

Chemistry and Experimental Physics.—A. M. Amaler, St. Paul's School; R. M. Barron, Guy's Hospital; F. A. Baxtle, Guy's Hospital; J. M. Bernstein, Owens College; A. Birch, University Tutorial College and private study; W. Bonello, Rutherford College, Newcastle-on-Tyne, and private study; J. F. E. Bridger, St. Mary's Hospital; H. W. Brown, University Tutorial College; W. J. Butcher, Owens College and private study; A. Caddy, St. Paul's School; J. D. C. Calcott, Grammar School and University College, Bristol; J. E. Chapman, Firth College; J. A. Churchill, University College and St. George's Hospital; A. Coleridge, University College, Bristol, and private study; G. E. Cope, Westminster Hospital and private study;

B. Dainow, Guy's Hospital and private study; Jeannette R. De Pass, Alwyne Institute; Margaret A. Dobson, University College; A. F. Elliott, Quondie School; G. Evans, University Tutorial College; D. Forsyth, Guy's Hospital; J. B. Goodall, City of London College and private study; D. H. Graves, Alwyne Institute; Horatia D. Hardy, Bedford College, Battersea Polytechnic, and private study; G. D. Harriet, University College; H. T. Hodgkin, Leighton Park School, Reading; A. L. Holland, King Edward School, Birmingham; A. P. C. P. Ingram, University College, Cardiff; A. F. Izard, Cranleigh School; D. T. C. Jones, Grammar School, Weston super Mare; H. H. Kiddle, Dulwich and University Tutorial Colleges; J. Klein, private study; H. K. Lacey, Guy's Hospital; W. E. V. Lewis, Mason College; E. V. Lindsey, St. Bartholomew's Hospital; J. W. Little, University Tutorial College; O. W. A. Löwe, University College, Liverpool, and private study; M. T. Male, University Tutorial College; G. H. H. Mansfield, University Tutorial College and private study; G. Menzies, private study; T. D. Miller, University and University Tutorial Colleges and private study; H. R. Minkley, Mason College and private study; E. M. Niall, University Tutorial College; R. C. Norton, B.A., University College, Nottingham, and private study; W. E. Parnore, Merchant Taylors' School; A. Pearson, Guy's Hospital; J. J. Pierce, private study; A. R. G. Pocock, University College; E. Prall, Merchant Taylors' School; M. J. Rees, Guy's Hospital; J. H. Stormont, Mason College; H. Tattersall, Guy's Hospital; E. O. Taylor, London Hospital; A. H. Thomas, University College, Cardiff; D. H. Trail, Dulwich College; D. D. Turner, Epsom College; J. E. Uley, Owens College; V. F. Wall, University Tutorial College; E. Z. J. Wallbridge, St. Mary's Hospital; A. B. Waller, Alwyne Institute; H. S. Ward, University College, Cardiff; R. N. Watson, Westminster Hospital; A. E. Wellby, St. Thomas's Hospital; F. C. Wetherell, Guy's Hospital; A. C. Williams, King's College; F. E. Wilson, Alwyne Institute; A. S. Woodmark, University Tutorial College and private study.

Biolog.—A. J. V. Botta, Westminster Hospital; G. Black, St. Thomas's Hospital and University Tutorial College; T. T. Blythe, University Tutorial College; P. A. Boissière, King's College; A. B. Brown, St. Bartholomew's Hospital; Amy Jane Burgess, London School of Medicine, University Tutorial College, and private study; W. B. Drew, Epsom College; A. G. Edie, St. Bartholomew's Hospital; J. W. Evans, University College, Aberystwith; J. A. C. Forsyth, Yorkshire College; Sarah Louise Fraser, Bedford College, London; P. R. Harris, St. Mary's Hospital; P. G. Harvey, St. Bartholomew's Hospital; A. P. Hayden, St. Mary's Hospital and private study; H. C. Hocken, Kingswood School; Margaret Ethel Hutchinson, University Tutorial College; H. H. Jones, University Tutorial College; E. T. Jones, University College, Aberystwith; T. Leah, St. Mary's Hospital; W. A. McEnery, Middlesex Hospital and University College; A. T. Marshall, King's College; C. de Z. Marshall, University Tutorial College; Alice Marietta Marvel, University College; Agnes Emma Meskenburgh, University College; Helen Moore, University College; H. V. Moxon, private study; Emily Nelson, University College, Liverpool, University Tutorial College, and private study; G. A. R. Nitch, St. Thomas's Hospital and private study; J. F. C. Orford, Owens College; W. S. Page, St. Mary's Hospital; W. Payne, Carleton College; T. M. Pearce, St. Bartholomew's Hospital; Margaret I. Pearce, Alwyne Institute; F. H. Picken, University College, Bristol; W. S. Rooke, University College; P. Savill, University College; G. F. Selous, St. Thomas's Hospital; D. W. Smith, Edinburgh University and School of Medicine; A. R. Soltau, London Hospital; N. E. Stallard, University and University Tutorial Colleges, and private study; H. S. Stannus, St. Thomas's Hospital and private study; A. J. Stillwell, private study and University Tutorial College; Florence Storr, Dulwich High School and University Tutorial College; J. K. Syme, University College; K. V. Trubshaw, Epsom College; G. S. Ward, London Hospital and private study; E. Wethered, St. Bartholomew's Hospital; F. H. Wood, St. Bartholomew's Hospital; M. D. Wood, Guy's Hospital; Ellen Elizabeth Janet Wyld, Westfield College.

§ These candidates have now completed the examination.

INTERMEDIATE SCIENCE AND PRELIMINARY SCIENTIFIC (M.B.) (CONJOINTLY).

Inorganic Chemistry.—First Class: S. Parrish (Int. Sci.), Royal College of Science, Yorkshire College, and private study; C. A. Hill (Prel. Sci.), Pharmacy School, King's, St. Thomas's, and private study; A. Howard (Int. Sci.), Royal College of Science; W. H. Wynn (Prel. Sci.), Mason College and private study. Second Class: E. A. Miller (Int. Sci.), Guy's Hospital. Third Class: D. J. Morgan (Prel. Sci.), St. John's College, Cambridge; E. H. Dixon (Int. Sci.), Merchant Venturers' Technical College, Bristol, and P. P. Platt, (Int. Sci.), private study, equal; E. Clark (Int. Sci.), Firth College and Central Hospital School, Sheffield; R. Mankier (Prel. Sci.), University College and private study; Keith E. Humphrey (Int. Sci.), Bedford College, London; A. Mare (Int. Sci.), Royal College of Science, University Tutorial College, and private study.

Experimental Physics.—First Class: S. G. Starling (Int. Sci.), Royal College of Science and University Tutorial College; G. R. Melton (Int. Sci.), Royal College of Science, University Tutorial College, and private study. Second Class: C. V. Drysdale (Int. Sci.), Finsbury and City Guilds, Birkbeck Institute, and private study. Third Class: E. E. Brooks (Int. Sci.), private study; W. Adams (Int. Sci.), Firth College, and O. W. Griffith (Int. Sci.), University College, Bangor, and A. I. Watkin (Int. Sci.), King Edward School, Birmingham, and Mason College, and E. W. Whittington (Int. Sci.), Sheffield Royal Grammar School and Firth College, equal.

Botany.—First Class: W. G. Freeman (Int. Sci.), Royal College of Science and St. Olave's Grammar School. Second Class: Igerma B. J. Solias (Prel. Sci.), Royal College of Science, Dublin, and Alexandra College. Third Class: H. Terry (Prel. Sci.), Owens College.

Zoology.—First Class: Agnes Kelly (Prel. Sci.), University and Bedford

School, West Kensington; B. J. Smith, Charing Cross Hospital; T. W. Smith, Charing Cross Hospital; A. E. Softly, St. Thomas's Hospital; G. H. A. Speers, St. Mary's Hospital; E. H. B. Stanner, University College, London; W. A. Steen, London Hospital; V. H. Symons, Mason College, Birmingham; Y. Takaki, St. Thomas's Hospital; A. W. Talbot, Guy's Hospital; H. C. Taylor, St. Mary's Hospital; J. B. Thompson, University College, London; R. T. Thorne, St. Bartholomew's Hospital; J. E. Turle, University College, London; F. W. Twort, St. Thomas's Hospital; A. B. Tytheridge, St. Paul's School; T. H. Vickers, St. Mary's Hospital; C. Visgar, University College, London; C. B. Wagstaff, Charing Cross Hospital; R. Walker, St. Bartholomew's Hospital; O. E. Ward, Mason College, Birmingham; A. C. S. Waters, University College, Cambridge; F. D. Welch, London Hospital; B. R. Westlake, Guy's Hospital; M. T. Whitehouse, Mason College, Birmingham; R. K. Wilson, London Hospital; H. C. Woodcock, St. Mary's Hospital; B. Yule, University College, London.

Part II. Practical Pharmacy.—H. S. D. Acland, St. Thomas's Hospital; F. B. Alderson, Firth College, Sheffield; T. P. Allen, St. Bartholomew's Hospital; F. E. Anley, Charing Cross Hospital; H. F. Ashley, St. Bartholomew's Hospital; F. R. Barwell, University College, London; H. R. Bateman, St. Thomas's Hospital; N. C. Beaumont, St. Bartholomew's Hospital; R. J. Bell, Charing Cross Hospital; A. Baven, St. Thomas's Hospital; F. M. Bingham, St. Thomas's Hospital; A. H. Brainerd, Mason College, Birmingham; H. Brand, Guy's Hospital; E. H. Bulten, St. Mary's Hospital; H. Burrows, St. Bartholomew's Hospital; H. Calvert, St. Thomas's Hospital; D. P. Chapman, Charing Cross Hospital; T. Chetwood, London Hospital; J. A. Churchill, St. George's Hospital; J. G. Churton, University College, Liverpool; J. M. Collins, St. Bartholomew's Hospital; M. W. Compton, St. Thomas's Hospital; S. D'A. Corbett, St. George's Hospital; C. V. Cornish, St. Bartholomew's Hospital; H. M. Cory, Mason College, Birmingham; W. S. Danks, St. Bartholomew's Hospital; J. D. Davey, Middlesex Hospital; D. Davies, St. Bartholomew's Hospital; D. L. Davies, University College, London; E. H. Davies, University College, Cardiff; E. N. de V. Dawson, St. Thomas's Hospital; W. E. Denniston, St. Thomas's Hospital; G. B. Dixon, Charing Cross Hospital; M. S. Double, Charing Cross Hospital; W. C. Douglas, St. Bartholomew's Hospital; B. G. Drake Brookman, St. George's Hospital; G. M. Eastment, Middlesex Hospital; R. F. Elmy, St. Bartholomew's Hospital; F. F. Elwes, Middlesex Hospital; W. Evans, Owens College, University and London Hospital; E. O. Faulkner, St. Mary's Hospital; R. Fawcett, St. Thomas's Hospital; W. Fawcett, St. Thomas's Hospital; G. S. Frost, St. Bartholomew's Hospital; J. Galt, St. Thomas's Hospital; T. H. Gandy, St. Bartholomew's Hospital; W. R. Gilbert, St. Thomas's Hospital; A. Hagen, University College, Cardiff; W. G. Hamilton, St. Bartholomew's Hospital; W. E. H. Hancock, University College, Bristol; H. S. Harris, St. Thomas's Hospital; W. T. Harris, St. Thomas's Hospital; J. D. Hartley, St. Bartholomew's Hospital; J. F. Harvey, Mason College, Birmingham; A. H. Hayes, St. Bartholomew's Hospital; F. M. Heath, University College, London; T. Higson, Owens College, Manchester; R. E. Hodgson, St. Mary's Hospital; W. B. Hopo, Guy's Hospital; E. Hudson, St. Thomas's Hospital; J. E. Humphreys, Charing Cross Hospital; H. W. Hynes, St. Bartholomew's Hospital; J. W. Hines, St. Bartholomew's Hospital; W. S. Inman, Firth College, Sheffield; A. D. Jameson, St. Thomas's Hospital; A. W. Jones, St. Thomas's Hospital; W. F. Jones, Charing Cross Hospital; J. E. Judson, Owens College, Manchester; R. T. Jupp, Mason College, Birmingham; W. A. Lamborn, Middlesex Hospital; F. S. Leach, University College, London; C. Lees, Charing Cross Hospital; E. L. Lilies, Charing Cross Hospital; H. P. Lobb, St. Bartholomew's Hospital; G. H. Low, St. Bartholomew's Hospital; A. R. McLachlan, Guy's Hospital; J. A. McLeod, London Hospital; M. M. Martin, St. Bartholomew's Hospital; W. B. Mayne, University College, London; E. Merry, London Hospital; T. C. Mitchell, Yorkshire College, Leeds; A. S. Morley, St. George's Hospital; R. Navarra, Middlesex Hospital; J. S. New, University College, London; J. W. Nunn, St. Bartholomew's Hospital; H. K. Nutt, St. Mary's Hospital; J. O'Han, St. Bartholomew's Hospital; J. M. A. Olivey, St. Thomas's Hospital; E. A. Parsons, Mason College, Birmingham; W. H. Passmore, Charing Cross Hospital; W. E. Peck, University College, London; T. Perrin, St. Thomas's Hospital; A. G. Pitta, Charing Cross Hospital; G. W. M. Pritchett, University College, London; E. G. Quinby, University College, Liverpool; A. D. Reid, King's College, London; J. J. Rodil, Guy's Hospital; E. Russell Elson, St. Bartholomew's Hospital; J. H. Sanders, London Hospital; E. J. Seorah, Firth College, Sheffield; H. M. Scott, Charing Cross Hospital; S. R. Scott, St. Bartholomew's Hospital; J. J. S. Scrase, St. Bartholomew's Hospital; W. C. R. Smith, St. Bartholomew's Hospital; A. E. Softly, St. Thomas's Hospital; F. H. Sprague, St. Mary's Hospital; S. Stevens, St. Bartholomew's Hospital; G. W. Stone, St. Bartholomew's Hospital; H. K. M. Stratford, Oxford University; Y. Takaki, St. Thomas's Hospital; H. S. Thomas, St. Bartholomew's Hospital; W. A. Trummer, St. Mary's Hospital; W. E. Turner, St. Mary's Hospital; A. L. Vaughan, St. Bartholomew's Hospital; L. A. Walker, St. Bartholomew's Hospital; C. F. Walters, University College, Bristol; J. Waters, Middlesex Hospital; A. J. W. Wells, St. Bartholomew's Hospital; G. W. S. Williams, St. Bartholomew's Hospital; C. W. Wirgman, University College, London; R. E. H. Woodforde, St. Bartholomew's Hospital; H. G. Wood-Hill, St. Bartholomew's Hospital; B. Yule, University College, London.

Part III. Elementary Botany.—W. Alcock, Firth College, Sheffield; P. F. Alderson, Middlesex Hospital; C. H. Anclum, Westminster Hospital; A. Ashmore, Yorkshire College, Leeds; C. C. Austen, Westminster Hospital; A. R. Baker, St. Bartholomew's Hospital; C. T. Baxter, Middlesex Hospital; C. H. Bennett, St. Mary's Hospital; H. Brand, Guy's Hospital; J. B. C. Brockwell, Guy's Hospital; J. A. Churchill, St. George's Hospital; J. P. Cunningham, St. Thomas's

Hospital; J. B. S. D'Aguiar, University College, Bristol; F. J. P. Daly, London Hospital; D. M. Davies, St. Mungo's College, Glasgow; A. M. Davis, Mason College, Birmingham; H. R. H. Denny, Guy's Hospital; C. H. Fagan, St. Paul's School, West Kensington; F. H. Fagan, St. Mungo's College, Glasgow; E. S. G. Fowler, Yorkshire College, Leeds; A. Freer, St. Mary's Hospital; T. H. Glaze, Mason College, Birmingham; F. J. Gomez, King's College, London; J. K. Griffith, London Hospital; R. W. B. Had, Guy's Hospital; H. J. Hartmann, St. Mungo's College, Glasgow; C. S. Hawes, St. Bartholomew's Hospital; W. C. Haydon, St. Mary's Hospital; C. M. Heazley, St. George's Hospital; H. A. Higgins, Guy's Hospital; F. Hughes, University College, Bristol; E. W. Hutton, St. Thomas's Hospital; C. W. W. James, University College, Bristol; F. B. Jefferies, King's College, London; F. J. F. Jones, Guy's Hospital; J. Lakeman, London Hospital; J. W. Lawson, Charing Cross Hospital; F. S. Leach, University College, London; C. E. H. Leach, St. Mary's Hospital; A. E. J. Lister, St. Bartholomew's Hospital; G. R. Macintosh, St. Bartholomew's Hospital; P. S. Manby, Guy's Hospital; T. F. G. Mayer, London Hospital; C. H. Moss-Burdell, St. Thomas's Hospital; H. T. T. Murdoch, Yorkshire College, Leeds; P. T. Nichols, Middlesex Hospital; A. P. Oliver, University College, Cardiff; R. R. Parkinson, Owens College, Manchester; J. E. Paul, St. George's Hospital; T. J. Pearce, St. George's Hospital; S. Pers, St. Thomas's Hospital; A. F. Reardon, St. Thomas's Hospital; B. Rodil, Guy's Hospital; W. H. Rutherford, St. Thomas's Hospital; F. R. Seager, Mason College, Birmingham; F. A. Segura, Guy's Hospital; M. Sheehan, Queen's College, Cork; G. H. Simpson, St. Mungo's College, Glasgow; W. G. Speers, St. Mary's Hospital; E. H. B. Stanley, University College, London; W. A. G. Stevens, Guy's Hospital; P. S. Stokes, Firth College, Sheffield; C. E. Thwaites, St. Mary's Hospital; H. Thwaites, London Hospital; E. B. Townroe, St. George's Hospital; C. H. Turner, St. Bartholomew's Hospital; A. C. S. Waters, Cambridge University; C. V. White, St. Thomas's Hospital; A. E. Whitehead, Firth College, Sheffield; T. York, Westminster Hospital.

Part IV. Elementary Anatomy.—E. C. Assen, Westminster Hospital; G. Barnes, St. Mary's Hospital; C. H. Brangan, Guy's Hospital; T. W. Brown, St. Bartholomew's Hospital; H. S. Capper, University College, London; A. F. Carleton, Middlesex Hospital; J. C. Clayton, University College, Bristol; H. E. Crawley, Oxford University; G. C. Cross, Middlesex Hospital; F. J. P. Daly, London Hospital; D. M. Davies, St. Mungo's College, Glasgow; W. C. Douglas, St. Bartholomew's Hospital; W. A. Dunne, Westminster Hospital; C. Edwards, Guy's Hospital; S. J. D. Esser, London Hospital; C. E. Edridge, Middlesex Hospital; W. Evans, Owens College, University and London Hospital; R. A. Fahey, St. Mary's Hospital; H. R. Faint, St. Bartholomew's Hospital; C. D. E. Forbes, St. George's Hospital; E. H. Foulds, St. Mungo's College, Glasgow; R. Gould, London Hospital; F. J. Gomez, King's College, London; S. A. Green, St. Bartholomew's Hospital; J. R. Hainday, London Hospital; J. Harris, University of Sydney, New South Wales; T. A. H. Harris, Firth College, Sheffield; A. E. H. Hawkes, University College, Liverpool; A. H. Hayes, St. Bartholomew's Hospital; H. Heashead, University College, Bristol; A. R. Hobbs, St. Mary's Hospital; W. Holmes, St. Mary's Hospital; E. Hutton, St. Thomas's Hospital; F. J. F. Jones, Guy's Hospital; J. E. Judson, Owens College, Manchester; S. J. Kerfoot, London Hospital; T. Lakeman, London Hospital; J. W. Lawson, Charing Cross Hospital; G. J. A. Leach, St. Bartholomew's Hospital; F. S. Leach, University College, London; T. F. Mansell, St. Thomas's Hospital; J. L. Martin, St. Mary's Hospital; S. Page, Mason College, Birmingham; W. G. Palmer, Guy's Hospital; W. P. Panchbridge, Middlesex Hospital; J. Pick, St. George's Hospital; H. G. Pucker, St. Bartholomew's Hospital; F. G. Quinby, University College, Liverpool; E. Raven, St. Thomas's Hospital; A. F. Reardon, St. Thomas's Hospital; J. J. Roche, Charing Cross Hospital; D. P. Rockwood, University College, London; C. S. Scott, St. Bartholomew's Hospital; G. Sheppard, Guy's Hospital; J. E. Soderberg, Westminster Hospital; P. T. H. Steadman, University College, London; W. Sykes, Owens College, Manchester; C. C. R. Thompson, St. Bartholomew's Hospital; C. E. Thwaites, St. Mary's Hospital; H. Thwaites, London Hospital; R. Walker, St. Bartholomew's Hospital; W. B. Watson, St. Mary's Hospital; H. E. Weston, St. George's Hospital; R. E. H. Woodforde, St. Bartholomew's Hospital.

THE SCHOOL OF MEDICINE OF THE ROYAL COLLEGES, EDINBURGH

THE three bodies concerned have now agreed upon a constitution, and have formulated regulations for the conduct of what will henceforth be known as the School of Medicine of the Royal Colleges of Edinburgh, in place of the more vague designation of the Extra-mural School. Lecturers are to be recognised in relation both to qualifying and non-qualifying courses, such lecturers to form the teaching staff of the school. The governing Board of the School is to consist of five members elected by the Royal College of Physicians, and five by the Royal College of Surgeons and five members elected by the lecturers of the school.

We believe the representatives of the physicians are Professor Simpson; Drs. Batty Tuke, Muirhead, Sibbald, and P. A. Young, of the surgeons Drs. P. Heron Watson, Blair Cunningham, John Smith, Cadell, and Professor Struthers; of the lecturers Drs. John Duncan, Berry Hart, George Gibson, Noel Paton, and R. W. Philip.

These members are elected for two years, and are eligible for re-election. A president is to be elected annually, but he may be re-elected. He is the head of the school and chairman of the governing Board. If he has not been elected from among the members of the Board he shall only have a casting vote. Seven members form a quorum. At least two regular meetings are to be held yearly, others in special circumstances.

The governing Board has for its chief function to supervise the whole management, and especially the maintenance and efficiency of the school. It will issue the Calendar, receive reports from lecturers as to their

courses maintain discipline, be a Board of Appeal both as regards lecturers and students.

The further general business of the school and all questions of finance will as heretofore be managed by the lecturers and their various committees.

The whole of the new arrangements will, without doubt, tend to advance the interests and efficiency of the entire academic school.

PUBLIC HEALTH AND POOR-LAW MEDICAL SERVICES.

INFLUENCE OF SCHOOLS IN THE DISSEMINATION OF DISEASES.
Dr. THURGOOD, medical officer of health, in his annual report to the Salop County Council, makes the following remarks: The regulations of the Educational Department start on a wrong basis—namely, that school closures are invariably required in consequence of an epidemic, instead of with the object of preventing one. That their regulations are not enforced and only rarely exist in the code, does not, however, unfortunately prevent their causing an immense amount of mischief in constantly leading to delay by managers who, otherwise willing to close, refrain from doing so for fear of imperilling their grant by not strictly complying with the regulations of the code. Very frequently in my experience it has happened that in the meantime the infection has spread so rapidly that the school practically closed itself. In my report to your Council in 1897 I drew attention to the impractical nature of the existing regulations which provided that no school should be closed except by order of a sanitary authority, a body which might not meet for weeks. The code was altered in the following year, but little improved, and still requires that no school should be closed except by order of at least two members of the sanitary authority, and an apparently authoritative note to an edition of the code (which I understand is most generally used) states that "Managers should never close their school unless they receive an order from the sanitary authority. A mere verbal notice, or a letter sent in a mandatory form, should not be acted upon."

It is obvious that to obtain a meeting of even two members of the sanitary authority and to get them to agree to take the responsibility of making a compulsory order for closure of a school involves delay which may be fatal. As these regulations are admittedly not enforced, why should not the regulations be brought into line with the practice? The evil effects of the existing system as regards dates for which examinations are fixed are frequently met with. I have a very large number of notes of cases of infectious disease which have been the result of a whip-up for an examination when infectious disease was prevalent, or where closure had been put off because of an impending examination which could not be put off, and I have known instances where a school inspector has obtained the attendance of a school for inspection, which had been closed up to the day of inspection on account of the prevalence of infectious disease, and was again closed the day after the inspection had been held. Only the other day I was advising the closure of a school on account of the presence of diphtheria in the family of the schoolmaster and in several families from which of fifteen attended the school, when it was strongly represented to me that the examination was imminent, and that an endeavour had been made to get it postponed, but without avail; and that if the school was closed, the examination could not be held this year, and that this would result in a pecuniary loss to the schoolmaster of at least £25. I carefully investigated this latter point, and have no doubt that the statement was correct and within the mark.

NOTIFICATION IN SURREY.

We must congratulate Dr. SEATON, the medical officer of health of the county of Surrey, upon his ability to report in respect of the past year that the Infectious Disease (Notification) Act of 1889 is now in force voluntarily in the whole of the county. It is something to be in a position to announce such an achievement in a county of the size and importance of Surrey. And having reached this standard of excellence in the county, Dr. Seaton proceeds to discuss briefly the question of universal compulsorily enforced adoption of notification, and seems to incline to the side of leaving the matter where it now stands, leaving that is, sanitary districts free to take up or not, as they individually please, the system now so widely in vogue. His argument is that authorities upon whom the Act was forced would not be likely to proceed with necessary preventive measures without further coercion. So much the worse for the ratepayers, to say nothing of the death and suffering to be set down as casualties to neglected precautions. Then again Dr. Seaton thinks that fear of publicity being given to outbreaks of disease in districts having bad sanitary conditions would also militate against adoption of the system. He hardly does he think of this factor in dairying counties, such as the Cotswolds, where none the less many of the farms are in a grossly unsanitary condition. But it must not be overlooked that notification is intended to give such early intimation of disease as will tend to diminish the likelihood of spread of infection, and hence it is to be argued that it is just those places in which the system is not in force that have most to fear from the attention of the public being drawn to the presence of infectious diseases in their midst. And we would ask which in the greater evil—the publicity given to disease in a community whence harm may easily be propagated, or the saving of sickness and life following upon knowledge of the whereabouts of infectious sickness? In the matter of disease incidence ignorance is not by any means bliss.

THE DRAINAGE OF TANWORTH.

In a letter addressed to the editor of the *Herald* Dr. Joy calls attention to the fact that certain drains discharge directly on the bank of the river at Tanworth, and he points out that "the wind blowing up these open-mouthed drains carries the gases into the yards and houses" of streets adjoining the stream. Two cases of diphtheria have,

it appears, recently occurred in children who had been playing by the river, the level of the water of which has been lowered by cutting through a wall with consequent exposure of the drain outlets referred to. Dr. Joy urges the importance of dealing with the matter forthwith and not deferring its consideration on the ground that a general scheme of sewage when carried into execution will remedy the evil. The drain outlets complained of do not, it is said, discharge an enormous matter, but the gases generated from the decomposition of soap waste and other filth and refuse are a possible source of danger with which, as Dr. Joy remarks, the Town Council, acting as the urban sanitary authority, will not doubt think it desirable to deal at once.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns, including London, 5,611 births and 4,235 deaths were registered during the week ending Saturday, August 16th. The annual rate of mortality in these towns, which had been 22.5 and 20.7 per 1,000 in the two preceding weeks, rose again to 29.9 last week. The rates in the several towns range from 18.6 in Croydon, 14.2 in Huddersfield, and 14.6 in Bristol to 36.5 in Liverpool, 31.0 in Wolverhampton, and 30.8 in Preston. In the thirty-two provincial towns the mean death-rate was 22.1 per 1,000, and exceeded by 31 the rate recorded in London, which was 19.0 per 1,000. The zymotic death rate in the thirty-three towns averaged 5.3 per 1,000; in London the rate was equal to 4.7 per 1,000, while it averaged 5.7 in the thirty-two provincial towns, and was highest in Wolverhampton, Norwich, and Preston. Measles caused a death rate of 1.2 in Manchester, 2.1 in West Ham, and 2.9 in Blackburn; whooping-cough of 1.1 in Oldham; and diphtheria of 6.7 in Sheffield, 7.0 in Leicester, 7.4 in Bolton, 9.7 in Wolverhampton and in Norwich, and 12.6 in Preston. The mortality from scarlet fever and from "fever" showed no marked excess in any of the large towns. The 76 deaths from diphtheria in the thirty-three towns included 55 in London, 4 in West Ham, and 3 in Liverpool. Three fatal cases of small-pox were registered in London, 2 in Oldham, and 1 in Liverpool, but not one in any other of the thirty-three large provincial towns. There were 273 cases of small-pox under treatment in the Metropolitan Asylums Hospitals and in the Highgate Small-pox Hospital on Saturday, August 16th, against 89, 159, and 237 at the end of the three preceding weeks; 54 new cases were admitted during the week, against 23, 115, and 60 in the three preceding weeks. The number of scarlet fever patients in the Metropolitan Asylums Hospitals and in the London Fever Hospital, which had been 3,267, 3,347, and 2,438 at the end of the three preceding weeks, had further risen to 2,511 on Saturday last, August 16th; 291 new cases were admitted during the week, against 220, 349, and 217 in the three preceding weeks.

HEALTH OF SCOTCH TOWNS.

DURING the week ending Saturday, August 16th, 506 births and 369 deaths were registered in eight of the principal Scotch towns. The annual rate of mortality in these towns, which had been 19.9 and 18.0 per 1,000 in the two preceding weeks, further declined to 17.6 last week, and was 3.2 per 1,000 below the mean rate during the same period in the thirty-three large English towns. Among these Scotch towns the death rates ranged from 16.0 in Edinburgh to 23.9 in Greenock. The zymotic death rate in these towns averaged 3.5 per 1,000, the highest rates being recorded in Leith and Greenock. The 233 deaths registered in Glasgow included 31 from diphtheria, 5 from measles, 3 from whooping-cough, and 3 from scarlet fever.

NOTIFICATION BY UNQUALIFIED PERSONS.

Dr. T. HANSON SMITH.—Intimations from such a source should be received as from a non-professional source, carrying neither medical authority nor the fees payable to medical men.

THE PRECARIOUS TENURE OF PUBLIC HEALTH APPOINTMENTS.

Dr. JNO. JAS. RUTHERFORD (Glasgow, Yorkist writes: May I ask if it is considered the right thing to do, for a younger practitioner to withdraw the appointment from a senior practitioner when he feels he has a majority of friends on the Board, and especially by ardently canvassing the members? I obtained the appointment six years ago, on the retirement of my predecessor.

"The questions which Dr. Rutherford puts scarcely need any reply, but we trust that some explanation of the facts will be forthcoming.

POLLUTED WELL WATER.

URGENT writes, with reference to a previous report under this head, that he has carefully attended to the eradication of pollution from the surrounding subsoil through which did run an extremely leaky drain from a water-closet. A case of typhoid using this water was not excited some time ago and the bacteria were only recently found by the public analyst. The water supplying the well comes out of the chest, and the well is dug through chalk.

"It seems that the subsoil surrounding the upper part of the well has been extensively polluted and recently with sewage containing typhoid excreta. Steps have been taken to prevent further pollution. There are no certain means of disinfecting the subsoil although with lapse of time the specific infection would come to an end. If it is considered to be impracticable to obtain a supply from some other source the sides should be rendered impervious at the upper part to prevent direct inflow from the impure subsoil even during rains, and the water should be regarded as suspicious until such time as chemical and bacteriological examinations as well as inspection have given consistently negative results.

PROFESSOR HUXLEY's personal estate has been sworn at £8,907 5s. 8d.

OBITUARY.

DR. KURT SCHIMMELBUSCH, who has been for some years Assistant to Professor von Bergmann in the Surgical Clinic of the University of Berlin, died on August 2nd at the age of 35. He was recognised as one of the most distinguished of the younger generation of surgeons in Berlin and had already made a considerable reputation by his researches on thrombosis and on the aseptic treatment of wounds.

DEATHS IN THE PROFESSION ABROAD.—Among the members of the medical profession in foreign countries who have recently passed away are Dr. Joaquin Laudo, Professor in the Medical Faculty of, and Dean of, the University of Cuba; Dr. Ernest Henri Baillon, Professor of Medical Botany in the Paris Medical Faculty, and author of numerous works on botanical subjects, aged 72; Dr. Ignacio Pirovano, Professor of Clinical Surgery in the Medical Faculty of Buenos Ayres, aged 52; Dr. Carl Bettenheim, Physician to the Rudolf-Spital and *Privat dozent* in the University of Vienna, aged 55; Dr. Kriener, Professor of Pathological Anatomy and Histology in the Medical Faculty of Montpellier, aged 54; and Dr. Doyen, Honorary Professor in the Medical School of Rhimsa.

MEDICAL NEWS.

DR. FRANCIS WARNER has been appointed an honorary member of the Society of Public Hygiene at Buda-Pesth.

The Hodgkins prize of 10,000 dollars (£2,000) has been awarded by the Smithsonian Institution in equal proportions to Lord Rayleigh and Professor Ramsay in recognition of their discovery of argon.

The eleventh International Congress of "Americanists" will be held in the city of Mexico from October 15th to 20th. Among the subjects on the programme are some bearing on the anthropology and ethnography of the aboriginal races of the American continent.

PRESENTATIONS.—The pupils attending the ambulance classes in connection with the Bolton Infirmary recently presented their teachers, Dr. Johnston and Dr. Mothersole, two of the honorary surgeons to the institution, with a handsome surgical box and a fully equipped secretaire respectively. The presentations were made through the ex-Mayor, Alderman Nicholson, J.P.

The Earl of Crewe opened the Crewe Memorial Cottage Hospital on August 7th. The site was given by the London and North-Western Railway Company, and the cost of the building has been defrayed practically by gifts of £1,000 each by Mr. F. W. Webb, chief mechanical engineer of the London and North-Western Railway Company, and Mr. Henry Yates Thompson, about £350 from the trustees of the late Mr. Martinbeath, and several other donations.

INSTRUCTION IN HYGIENE FOR LADIES.—The Bedford College (for Women) has established separate courses of instruction in scientific hygiene, which now takes its place in the College curriculum as a special subject. Students are required to devote themselves for a session or more solely to hygiene and allied branches of science, such as physiology, bacteriology, chemistry, and physics. The work in all these subjects is to be practical as well as theoretical.

FIRE AT MINTO HOUSE.—A most disastrous fire occurred in Minto House, Edinburgh, on Sunday night. Minto House is one of the numerous buildings used by lecturers in the Extra-mural School of Medicine, and it contains not only class rooms, but museums, laboratories, etc. Unfortunately it was in one of the museums that the fire broke out and did its main mischief. Dr. Halliday Croom is the main sufferer, his museum specimens (a valuable collection of many years), diagrams, and other class accessories having been irreparably destroyed. His coadjutor, Dr. Haultain, has also lost a valuable collection of microscopic preparations. The lecturer on botany (Mr. McAlpine) has had his specimens much injured by smoke and water.

BRITISH LARYNGOLOGICAL, RHINOLOGICAL, AND OTOLOGICAL ASSOCIATION.—The following have been elected office-bearers of this Association: *President*: Dr. George Stoker, London. *Vice-Presidents*: Dr. E. Law, Dr. Middlemas Hunt, Dr. William Milligan. *Council (Metropolitan)*: Dr. W. McNeill Whistler (*ex-officio*), Dr. Dundas Grant, Mr. Mayo Collier, Mr. Wyatt Wingrave, Mr. G. C. Walkin; (*Extra Metropolitan*): Dr. J. M. E. Sealiff, Mr. John Bark. *Honorary Secretary*: Dr. Pegler.

LECTURES AT THE SANITARY INSTITUTE.—The twentieth course of lectures and demonstrations for sanitary officers under the auspices of the Sanitary Institute will begin on September 3rd, and will be continued on Tuesdays and Fridays at 8 p.m. in the Parkes Museum, Margaret Street, W. The various subjects will be dealt with in a course of twenty-four lectures given by well-known authorities, and will be illustrated by diagrams, drawings, models, and lantern slides. The Museum of Sanitary Appliances and the Library will be open free during September, October, and November to students attending the course. Information as to fees, etc., may be obtained from the Secretary of the Institute, Mr. E. White Wallis, Margaret Street, W.

MEDICAL VACANCIES.

The following vacancies are announced:

CONVALESCENT FEVER HOSPITAL, Gore Farm, Darenth, near Dartford.—Dispenser; must be qualified under the Pharmacy Act. Salary, £5 a month, with board, lodging, and washing. Applications to the Medical Superintendent.

CUMBERLAND INFIRMARY, Carlisle.—House-Surgeon. Salary, £70 per annum, with board, lodging, and washing. Appointment for one year. Applications to the Secretary by August 24th.

GENERAL HOSPITAL FOR SICK CHILDREN, Pendlebury, Manchester.—Junior Resident Medical Officer; doubly qualified, must devote his whole time. Salary, £80 per annum, with board and lodging. Appointment for one year. Applications to the Chairman of the Medical Board by August 25th.

GENERAL HOSPITAL, Nottingham.—House-Physician. Appointment for two years, but eligible for re-election. Salary, £100 per annum, rising £10 a year to £120. Assistant House-Surgeon. Appointment for six months. Board, lodging, and washing in hospital; no salary. Applications to the Secretary for the former post by September 11th, and for the latter by September 17th.

GLAMORGAN COUNTY ASYLUM, near Bridgend.—Junior Assistant Medical Officer. Salary, £300 per annum, rising £10 yearly to £150, with board (no beer or wine), lodging, and washing. Applications to the Medical Superintendent by August 22nd.

JAFFRAY SUBURBAN BRANCH OF THE GENERAL HOSPITAL, Gravelly Hill, Birmingham.—Resident Medical and Surgical Officer, doubly qualified. Salary, £150 per annum, with board, residence, and washing. Applications to the House Governor, General Hospital, Birmingham, by August 24th.

MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST—Honorary Assistant Physician. Must be on the *Medical Register*. Applications to Charles Belkens, Honorary Secretary, before August 24th.

NEWCASTLE-ON-TYNE DISPENSARY.—Visiting Medical Assistant, doubly qualified. Salary, £125 for the first year, and £150 afterwards. Applications to R. W. Sisson, Honorary Secretary, by August 21st.

NORFOLK AND NORWICH HOSPITAL.—Assistant House-Surgeon; doubly qualified. Appointment for six months. Board, lodging, and washing provided. Applications to the House-Surgeon by September 2nd.

PARISH OF LAMBETH.—Assistant Medical Officer and Dispenser for the Infirmary in Brook Street, Kennington; doubly qualified; must devote his whole time to the duties of his office. Salary, £125 per annum, with board, furnished apartments, and washing. Applications, on forms provided, to W. B. Whitist, Clerk, Guardians' Board Room and Offices, Brook Street, Kennington Road, S.E., by August 24th.

ROYAL SOUTHERN HOSPITAL, Liverpool.—Third House-Surgeon. Salary, £85 per annum, with board, lodging, and laundry. Applications to the Chairman of the Medical Board by August 26th.

SALISBURY INFIRMARY.—House-Surgeon, unmarried, doubly qualified. Salary, £100 per annum, with board, lodging, and washing. Applications to the Secretary by August 23rd.

SCHOOL BOARD FOR LONDON.—Medical Officer for the Board's Training Ship *Shaftebury*, lying off Grays, Essex; must reside within two miles of the ship. Commencing salary £100 a year, which may be increased by annual increments of £10 to £150 a year. Applications to A. E. Garland, Clerk to the Managers, School Board Offices, Victoria Embankment, W.C., by August 31st.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—Assistant House-Surgeon. Salary, £90 per annum, with board, lodging, and washing, etc. Applications to the House-Surgeon by August 20th.

TEIGNMOUTH INFIRMARY, DISPENSARY, AND CONVALESCENT HOME.—House-Surgeon (to act also as Secretary), doubly qualified. Salary, £60 per annum, with rooms, board, and washing. Applications to the Chairman of Committee by August 19th.

MEDICAL APPOINTMENTS.

BARNCOFT, A. E. J., L.R.C.S.I., L.K.Q.C.P.I., appointed Medical Officer for the Myddle and Newchurch District of the Wiltshire Union.

BEAUMONT, Dr., appointed Medical Officer for the Camberwell Union Infirmary, vice Henry Unaboh, M.R.C.S. Eng.

BOND, N. T., M.B., C.M. (Edin.), appointed Medical Officer for the No. 4 District of the Liskeard Union.

BURDIN, J. N., L.R.C.S.I., L.K.Q.C.P.I., L.S.A., appointed Medical Officer for the Potten District of the Biggleswade Union.

CAREY, W., L.R.C.S.I., L.M., appointed Medical Officer for the Workhouse and the Holbrook District of the Sanford Union.

COATES, Richard, L.R.C.P., M.R.C.S., appointed Resident Medical Officer to the Newport and Monmouthshire Infirmary vice S. H. Lee, B.A., M.B., B.C. Camb., M.R.C.S., L.R.C.P. Lond., resigned.

CRONIN, Charles Percival, M.B. Lond., F.R.C.S. Eng., appointed Honorary Surgeon to the Weston Super Mare Hospital, vice G. E. Alford, deceased.

FLUTEHAM, Dr. J. C., appointed Medical Officer and Vaccinator for the Winstor District of the Rutland Union.

GARRIN, Mr. E. F., appointed Medical Officer for the No. 2 District of the Steyning Union.

GIBSON, A., M.B., appointed Medical Officer for the Sutton-on-Trent District of the Southwell Union.

JENNINGS, John Henry, L.R.C.P. (Edin.), M.R.C.S. Eng., reappointed Medical Officer of Health to the Lytham Urban District Council.

JOHNSTON, J. I., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer for the Upholland District of the Wigan Union.

JONES, Mr. D. W., appointed Medical Officer for the Inkberrow District of the Alcester Union.

JONES, Dr. R. D., appointed Medical Officer for the Grangetown District of the Cardiff Union.

KELLY, Charles, M.D., F.R.C.P. Lond., M.R.C.S. Eng., reappointed Medical Officer of Health to the Worthing Town Council.

KINODON, Wilfred R., M.B. Durh., appointed Junior Resident Medical Officer to the Stoke Newington Dispensary, London, N.

PAINSON, G. G., M.B., appointed Medical Officer for the Fourth District of the Westbury and Whorwellsdown Union.

POWELL, Dr. J. J., appointed Medical Officer for the First District of the Highworth and Swindon Union.

REILLY, Mr. F. W., appointed Medical Officer for the Bellings District of the Wigan Union.

RHIND, T., M.R.C.S. Eng., L.R.C.P. Lond., appointed Medical Officer for the No. 1 Western District of the Billingsdon Union.

ROBERTS, A. H., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer of Health to the Malling Rural District Council.

ROYDS, W. A. S., L.R.C.P. Lond., M.R.C.S. Eng., appointed Medical Officer for the St. Mary Howine District of the Whitchurch (Hants) Union.

SANDFORD, G. Cabrow, M.B., appointed Resident Obstetric Surgeon to the Dispensary, York.

SPICKER, R. H. B., M.D. St. And., M.R.C.S. Eng., reappointed Medical Officer for the East and West Austey Districts of the Southmolton Union.

STUMB, E. G., F.R.C.S., appointed Assistant in the Throat Department at St. Thomas's Hospital.

THOMPSON, Dr., appointed Medical Officer for the Twycross District of the Mark 4 Haverthill Union.

TYNNE, Thomas, M.D. (Edin.), F.R.C.S. Eng., reappointed Medical Officer for the Millicorner and Cockfosters District of the Edmonton Union.

WHEKE, Mr. C. E., appointed Medical Officer for the Pinchbeck District of the Spalding Union.

WYCHE, E. M., M.R.C.S., L.R.C.P., appointed Assistant Medical Officer to the Infirmary of the City of London, Bow Road, E.

DIARY FOR NEXT WEEK.

TUESDAY.

THE CLINICAL MUSEUM, 311, Great Portland Street.—Open at 3 P.M.
Lecture at 4.

BIRTHS, MARRIAGES, AND DEATHS.

The charge for inserting announcements of Births, Marriages, and Deaths is 6d., which sum should be forwarded in post office order or stamps with the notice not later than Wednesday morning, in order to ensure insertion in the current issue.

MARRIAGES.

HARMON—HAIN.—On July 17th, at St. Catherine's Church, Belle Vue, Wakefield, by the Rev. R. N. Hurt and the Rev. H. I. Bardsley, James Milne Harmon, M.B. & C. M. Edin., to Lucy Margaret, second daughter of G. B. Hain, Esq., of Bellefield House, Wakefield.

WHELAN—FRAN.—On August 1st, at St. Mary's, Pinchbeck, by the Rev. F. J. Wayet, Vicar, assisted by the Rev. G. E. Weeks, B.A., (curator of the bridegroom). Courtesy Charles Weeks, M.R.C.S., L.R.C.P. Lond., second son of G. B. Weeks, R.N., to Nanette Cochrane, daughter of W. Bern, Esq., of Monaghan, Ireland. No cards.

WOOD—MURLEY.—On August 13th, at the Cathedral, Southwell, by the Rev. E. A. Coghill, Vicar of Holy Trinity, Southwell, W. T. Wood, L.R.C.P. Edin., L.R.C.S. Edin., L.M. & L.V.P. Edin., of Gresswell, Derbyshire, to Grace Ellen, eldest daughter of the late J. W. Minkley, Esq., of Southwell, Notts.

LETTERS, NOTES, AND ANSWERS TO CORRESPONDENTS.

COMMUNICATIONS FOR THE CURRENT WEEK'S JOURNAL SHOULD REACH THE OFFICE NOT LATER THAN MIDDAY POST ON WEDNESDAY. TELEGRAMS CAN BE RECEIVED ON THURSDAY MORNING.

COMMUNICATIONS respecting Editorial matters should be addressed to the Editor, 429, Strand, W.C., London; those concerning business matters, non-delivery of the Journal, etc., should be addressed to the Manager, at the Office, 429, Strand, W.C., London.

AUTHORS desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate beforehand with the Manager, 429, Strand, W.C.

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—of course not necessarily for publication.

CORRESPONDENTS not answered are requested to look to the Notices to Correspondents of the following week.

MANUSCRIPTS FORWARDED TO THE OFFICE OF THIS JOURNAL CANNOT UNDER ANY CIRCUMSTANCES BE RETURNED.

IN order to avoid delay, it is particularly requested that all letters on the editorial business of the JOURNAL be addressed to the Editor at the Office of the JOURNAL, and not to his private house.

PUBLIC HEALTH DEPARTMENT.—We shall be much obliged to Medical Officers of Health if they will, on forwarding their Annual and other Reports, favour us with duplicate copies.

Queries, answers, and communications relating to subjects to which special departments of the BRITISH MEDICAL JOURNAL are devoted will be found under their respective headings.

QUERIES.

H. B. L. would be glad to learn of a home for an old man who is imbecile. The man is harmless, but not fit to take care of himself. His friends can pay 30s. per week.

M. B. will be much obliged for information as to the details of the treatment of ulcers by exposure to oxygen gas, as demonstrated by Dr. Stoker on August 1st at King's College.

E. J. D. writes: Is there any institution for the mechanical treatment of infantile paralysis, affecting the left arm and leg? Massage has been used with some success.

R. V. S. would be glad to know of an Institute, private or public, where a home could be made for a female patient suffering from silliness and hallucinations of paralysis. Her family could pay 7s. to 10s. weekly. Near Newport (Mon.) if possible.

* There is no institution where such a case can be taken at the price. If insane, why not have her certified and sent to the county asylum?

FAR AWAY writes: Will you or any of your readers kindly answer the following questions for me? (1) Are there any statistics published giving the result of the treatment of enteric fever and tropical diseases with and without alcohol? (2) Has abstinence of the liver ever been noticed in persons who have been total abstainers? (3) How many members of the British Medical Association are total abstainers and do not prescribe alcohol in their practice?

M. D. asks for suggestions for treatment in case of obstinate and very long-continued constipation. Spare habit of body, sallow complexion; occasional heartburn, often rejection of mucoid jelly-like material by mouth, no vomiting; very good appetite; below proper weight for age and height; flatulence, sometimes extreme and distressing; stools generally hard and dry, varying in colour, generally too dark, rarely too light; very rarely they are quite normal for day or two, then complete amelioration of symptoms.

ANSWERS.

L.R.C.P. & S.E.—We are afraid nothing can be done in the matter.

A MEMBER.—Mr. Alfred Cooper gives the following formula in his book (page 454) for a solution of sesquichloride of mercury for intramuscular injection: Sesquichloride of mercury, 5 grains; iodide of sodium, 10 grains; distilled water, 200 minims. The quantity for an injection is 10 to 15 minims.

MR. ALBERT DUBA (Weilherly Road, S.W.) writes that in a *Treatise of the Diseases of Children*, edited by Louis Starr, M.D., 1894, on page 61 an analysis of Mellin's food is given as follows: Water, 12.97; fat, 0.18; albuminoids, 10.61; soluble carbohydrates, 68.18; starch, 0.00; gum, cellulose, etc., 5.48; ash, 5.75-100.00.

LISTERITE.—Our correspondent appears to be under a misapprehension in supposing that the appeal referred to is intended to have an international or national scope. It is, as we understand it, a proposal that the Fellows and Members of the Royal College of Surgeons should present to the College a portrait of Sir Joseph Lister, who was at one time a member of the Council of the College.

AMBULANCE WORK.

V.—Either of the following works would probably answer our correspondent's requirements: *First Aid to the Injured and Management of the Sick*, by E. J. Lawrence, M.D.; *First-aid Lectures on Ambulance Work*, by R. Lawton Roberts, M.D.

INSTRUCTION IN LIP READING

Mr. J. BRADBURY WINTERHURST writes: In answer to "A pupil" I can thoroughly recommend Miss Haro's School, 11, St. Michael's Place, Brighton. The teaching is admirable, judging from the results, and there are all home comforts.

HOT WATER HEATING

B. H.—Our correspondent will find in *Hygiene*, by Satter and Firth (Longmans, Green, and Co.), a description of the proper arrangement of the piping required for the distribution of hot water throughout a dwelling-house. In recent volumes of the architectural papers the matter has been gone into in considerable detail.

NOTES, LETTERS, ETC.

ERRATA.—In Mr. Anderson's paper on Art in Relation to Anatomy, published in the *BRITISH MEDICAL JOURNAL* of August 10th, Figs. 7 and 13 were accidentally transposed.—Under the head "Answers," in the same issue, Mr. Lewis, instead of Messrs J. and A. Churchill, was given as the name of the publisher of Chavasse's *Advice to a Wife*.—At page 392 of the same issue the name of Mr. Robert Cuffe, Woodhall Spa, was misprint.

THE END OF THE CENTURY.

Dr. F. JAMES MOLONY (Perleok) writes: In the President's eloquent address there is a passage, apparently intended if we may judge from the context, to refer to the end of the century, "When the last stroke of the bell is knelt at midnight the last hour of 1899." Should not this be the last hour of 1900?

The impression that the new century begins in 1900 is very general, but it is obvious that it must begin in 1901—the Christian era having begun in the year 1, not in the year 0!

MEDICAL MISSIONARY WANTED

Is a letter published in a contemporary, Mr. H. Vere White, 8, Dawson Street, Dublin, writes: It to be made known to young medical men who might be willing to devote some years to medical mission work, that the *Medical Missionary Society* is anxious to get this year the help of a fully qualified doctor for the mission station at Ranchi, Bengal. The Society for Promoting Christian Knowledge, has for this purpose put a grant of £200 a year at the bishop's disposal, and has undertaken to pay this sum for at least three years. The society will also give £50 for passage and outfit. The doctor appointed will be entitled to a house rent free, or, if he so desired, it might be possible for him to make arrangements for living in the house of a married missionary. Ranchi is about sixty miles from Hazaribagh, the head quarters of the Dublin University mission to Chota Nagpore. Further information can be obtained by application to Mr. White.

PATHOLOGY UP TO DATE.

Dr. A. STODART WALKER (Edinburgh) writes: In a recent weekly instalment of Lloyd's *Encyclopaedia Dictionary* at present publishing, the following is given as the pathology of locomotor ataxia: "A peculiar form of apparent paralysis with more or less wasting, but always unsteady and disorderly muscular movements, though muscular power is entire, and loss of co-ordinating movement. It is generally associated with degeneration of the posterior columns of the spinal cord and posterior roots of the spinal nerves, sometimes known as Charcot's disease. According to Sir James Paget and Professor Humphry, it is probably a compound of two things—rheumatic gout and chronic rheumatic arthritis—not exclusively so, but a method of rheumatic arthritis altered from its ordinary fashion by the intervention of the locomotor ataxia. Mr. Hutchinson considers it a sort of tumorous old age, an old age of premature senility of the nervous system, with loss of sensation and considerable alteration in the heads of the bones."

This is really too good to be missed. I have copied the statement word for word, and the addition of italics might detract from many of its delicious items. I can only hope that the pathology of this otherwise excellent dictionary is not *non tangenda, non movenda*.

A CURIOUS POUFTICE.

Mr. HENRIK VOS (Tottenham, N.) writes: I well remember a case I had when dressing for Mr. Holden at St. Bartholomew's Hospital. A man who had been intemperate was rolling a sod of grass, and got some grit into his left palm. It inflamed; he put on hot cow-dung poultices by the advice of some country friends. He was admitted with a dreadfully swollen hand. It was opened, but the phlegmonous process spread up to the shoulder, and it was opened in many places, and at last, under chloroform, the limb was amputated below the joint. The stump sloughed, and pus pointing at the back of the neck, an opening was again made. He became in such a weak state that chloroform could not be administered, and one morning, in going the usual round of the ward, he had such a dread of more incisions that, saying to us all standing round his bed, "I can bear it no more, I must now die," he actually did die in a few minutes in our presence. His was the last arm that Mr. Holden ever amputated at St. Bartholomew's, and I had the honour of holding it at the operation.

F.R.F. writes to say that the disgusting poultice described by Mr. Bate was commonly used some years ago in North Devon. It had the effect of making abscess of the breast point and discharge much more quickly than ordinary applications did, but there was a corresponding destruction of tissue. The dung was used fresh.

SCALE OF CHARGES FOR ADVERTISEMENTS IN THE BRITISH MEDICAL JOURNAL.

Eight lines and under	50	4	0
Each additional line	0	0	6
A whole column	1	17	6
A page	5	5	0

An average line contains six words.

Advertisements should be delivered, addressed to the Manager, at the Office, not later than noon on the Wednesday preceding publication; and if not paid for at the time, should be accompanied by a reference.

Post-Office Orders should be made payable to the British Medical Association at the General Post-Office, London. Small amounts may be paid in postage-stamps.

N.B.—It is against the rules of the Post Office to receive letters at *Postes Restantes* addressed either in initials or numbers.

BRITISH MEDICAL ASSOCIATION. SIXTY-THIRD ANNUAL MEETING.

SECTION OF MEDICINE.

F. W. PAVY, M.D., F.R.S., President.

WEDNESDAY, JULY 31ST.

DISCUSSION ON DIPHTHERIA AND ITS TREATMENT BY ANTITOXIN.

I.—SIDNEY MARTIN, M.D., F.R.S., F.R.O.P.,

Assistant Physician to University College Hospital, and to the Hospital for Consumption, Brompton.

MR. PRESIDENT AND GENTLEMEN,—There have been numerous remedies which have been used in the treatment of diphtheria, some of which—local applications—have for their object an antiseptic action on the membrane or a loosening action by which the membrane is made to separate more easily. Others, again, have been vaunted for their general action; that is, for their effect in counteracting the general symptoms of the disease. In no instance, however, in which a drug has been so extolled is there evidence that there has been an effect on the general symptoms of the disease, either in relieving the bodily depression, in reducing fever, in relieving or preventing the occurrence of bronchopneumonia or paralysis, and the extension of the disease to other parts. When, therefore, a remedy is introduced, the recommendation of which is based on well established scientific experiments, its application in the treatment of the disease, and especially its effect on the symptoms of the disease, require close examination, not only at the bedside, but in the laboratory. The recommendation of antitoxin in the treatment of diphtheria is based on the results of a study of the pathology of the disease, and it is necessary that this should be clearly understood before the value of the remedy can be in any way gauged.

Diphtheria may be defined as a membranous inflammation of a mucous membrane, usually of the respiratory passages, due to the invasion of the bacillus diphtheria, which does not enter the body but forms poisons in the membrane, which produce general symptoms, fever, etc., as well as a palsy due directly to a nerve degeneration. One point I should like to insist upon in this definition, namely, that the presence of nerve degeneration is the pathological test of diphtheria as a disease.

There are other membranous inflammations of the throat due to micro-organisms, but diphtheria is the only one which leads to nerve degeneration. Similarly, the pathological test of the bacillus is not that it produces death, but that it produces nerve degeneration. The pathological test of the poisons found either in the bodies of patients dead of diphtheria or formed by the bacillus diphtheria outside the body, is not that they produce death (because many poisons have a similar effect), but that they produce nerve degeneration. It is not meant by this that there are no other poisons which produce nerve degeneration, because such are known, and when it is a question of the bacillus diphtheria, it is nerve degeneration which is the final and most accurate test of the poison.

It must be evident that the chemical poisons which are found in diphtheria are of great importance in the present connection, inasmuch as it is these poisons which the antitoxin has to counteract. Patients die of diphtheria due, some from mechanical obstruction by the membrane, some from bronchopneumonia, and some from a mixed infection, but the majority die from the effects of the poisons in combination with one of the two first. Death due to the poison occurs from syncope, suppression of urine, asthenia, and from paralysis.

The chemical poisons which are found in patients who have diphtheria belong to two classes: one is found in the membrane the other is found in the tissues, blood, and spleen, and the action of these two classes of poisons, although

similar in some respects, presents important points of difference. The chemical poison which is found in the membrane may be extracted by treating the fresh membrane with sterile salt solution, diluting and concentrating it at a low temperature, dialysing (to get rid of the extra amount of salt) and precipitating with alcohol. The alcohol precipitate, after drying, may be dissolved in water. If a small quantity of this precipitate, which is almost imponderable, be injected into a vein of a healthy rabbit, the animal will after a time show paralysis, which gradually increases in severity; it will waste, it may have diarrhoea, and it will die after a longer or shorter period. At the post-mortem examination, extensive degeneration of the nerves is found, associated with fatty degeneration of the skeletal muscles, and—what is of extreme importance—fatty degeneration of the heart. Subcutaneously injected, the poison produces a necrosis of the tissue. The characteristics of this poison, therefore, are that it acts in a single dose, and that it reproduces the symptoms and the pathological changes found in diphtheria. It is, so to speak, the chemical representative of the living, infective agent in the membrane, which is the bacillus diphtheria. No analysis is possible of this chemical substance of the membrane; but the profound effect which it produces on the body by a single infinitesimal dose would suggest that it belongs to the class of bodies known as ferments.

The poisons which are found in the tissues of patients dead of diphtheria—especially in the blood and the spleen—differ from this poison in the membrane. They are of two kinds; one of which belongs to the class of digested proteids, namely, albumoses, and is similar in chemical reactions to the albumoses formed in digestion in the stomach and small intestine; the other body is a nonprotein substance, namely an organic acid. It may be said of this latter substance that although it produces some nerve degeneration it does not produce the progressive paralysis nor the profound effect on nutrition which is characteristic of the other poisons of diphtheria. The albumoses, on the other hand, have a very characteristic action. Injected intravenously into rabbits, they produce in one or two hours a rise of body temperature, which on the repetition of the dose frequently lasts several days. They are in fact the fever producers in diphtheria. Although it is possible to kill an animal in a few hours by a single dose of the albumoses intravenously injected (an event which does not follow the injection of the ferment of diphtheria), yet the characteristic action of the albumoses is only brought out by the injection into a vein of two or three small doses on successive days. When this is done, besides the fever produced, the animal shows at the end of a week or ten days slight paralysis, which gradually increases, and which is not infrequently accompanied by severe attacks of dyspnoea, in one of which the animal may expire. Large doses of the albumoses produce great wasting of the body, as well as diarrhoea. In the post-mortem examination of animals that have died, extensive nerve degeneration and fatty degeneration of the heart are found, and after large doses there is fluidity of the blood after death, which is characteristic of death from many different kinds of albumoses. These albumoses differ, therefore, from the poison present in the membrane, not only from the fact that their injection produces an immediate rise of temperature, and their repeated injection a continuous fever, but from the fact that they act in producing palsy only in multiple doses. Injected subcutaneously they do not produce necrosis, but oedema, the extent of which depends on the largeness of the dose given.

In some experiments with the albumoses there is no paralysis observable during life, but after the animal is killed, in from four to ten weeks, the nerves are found degenerated in one or other part of the body, showing that the poison had some effect, although the degeneration was not sufficiently extensive to produce symptoms during life. The fatty degeneration of the heart, which is a feature of poisoning by albumoses, is an effect which is produced by the albumoses formed by other micro-organisms—for example, the bacillus anthracis and some forms of septicaemia; and since these micro-organisms do not produce the ferments like the bacillus diphtheria and the bacillus tetani, it is probable that the fatty degeneration of the heart is ascribable to the action of the albumoses, and not to any direct action of the ferment.

Both these classes of poisons—that which is found in the membrane and that which is found in the tissues of patients dead of diphtheria—can be formed artificially outside the body by growing the bacillus diphtherie in suitable media. The ferment which is present in the membrane, or toxin as it is sometimes called, is now made by growing the bacillus diphtherie in a slightly alkaline meat broth, containing 2 per cent. of peptone and 0.75 per cent. of salt. When such a solution is inoculated with a pure culture of the bacillus, and placed in an incubator while a current of air passes over the surface of the liquid, as in Roux's method, the liquid is found to contain this poison after a week or two. The bacilli are removed by filtration through a porcelain filter, and the filtrate, which is still alkaline and yellowish or yellowish-brown in colour, contains the greater part of the peptone which was added, as well as the poisonous body. This liquid may be obtained of a very high degree of virulence, so that one-fifth of a cubic centimetre, or even less, injected subcutaneously into a guinea-pig weighing 500 grammes will produce death in thirty-six to forty-eight hours; this effect of the poison has been taken as a test of its activity. In his earlier experiments Roux separated this poison by carrying it down in the liquid by means of calcium phosphate, and thus obtained a substance which reproduced the symptoms of diphtheria in infinitesimal single doses. Injected intravenously into rabbits this toxin, as will be shown presently, reproduces not only the symptoms, but also the nerve degeneration which is the pathological characteristic of diphtheria.

If, instead of growing the bacillus diphtherie in broth containing peptone, it is grown in alkaline broth containing 0.75 per cent. of salt, but instead of peptone about 1 per cent. of alkali albumin, the products of the growth of the bacillus are not the same as in the first instance. Alkali albumin is a product which is digestible—that is, peptone or pepsin—in a suitable medium will transform it into albumoses and peptones. The bacillus diphtherie does the same. It transforms the alkali albumin into albumoses which have the specific action previously described, and forms a small quantity of the organic acid. These albumoses, for example, when injected in repeated small doses into rabbits, produce fever, wasting, and sometimes diarrhoea, but chiefly a progressive paralysis, which is associated with extensive nerve degeneration and also with fatty degeneration of the heart.

For these reasons, therefore, the bacillus diphtherie is the cause of diphtheria. It is found in the membrane, it can be separated from the membrane, and when grown in suitable media outside the body it forms poisons which have the same physiological action as those present in the membrane and in the tissues of patients dead of diphtheria, the specific test relied on being the dependence of the palsy on nerve degeneration. It is these poisons, therefore, which the antitoxin has to counteract.

The pathological process in diphtheria must be considered in the following manner. When the membrane is formed, the bacilli growing in it, especially near the surface, secrete a ferment which, when absorbed into the body, produces by acting on the proteids of the body digestive products, the chief of which belong to the albumose class. It is not that the body is poisoned by a single large dose and then the action stopped (although this may occur in certain cases), but it is that numerous small doses are, in the course of the disease, absorbed into the system, and are gradually producing their effects.

We will now proceed to discuss the effect of the diphtheritic antitoxin in counteracting the effects of these poisons.

The preliminary experiments in this direction have been performed solely on rabbits, the poison alone being injected into one animal, and the poison, with a certain amount of antitoxin, being injected into another, both animals being kept under similar conditions. The effect on the temperature and weight of the animal was observed, as well as the onset of any paralytic symptoms, and a *post-mortem* examination was made soon after death (or, if the animal did not die, some weeks after the inoculation), the heart being examined for fatty degeneration, and the nerves for the characteristics of degeneration. In this way rabbits can be used as a very delicate test of the action of the diphtheria poisons and of the antitoxin.

When the antitoxic serum itself is injected in large doses

into the venous circulation of an animal it produces but little effect on the body temperature and no loss of weight. It is, as far as could be judged in the rabbit, a perfectly innocuous substance (Chart I).

Chart I.

The effect of injecting a dose of the toxin in one animal and a dose of toxin mixed with a certain proportion of antitoxin in another is seen in the following experiment (Chart II). The toxin was prepared by Roux's method, and

Chart II.

was formed by the bacillus diphtherie growing in 2 per cent. peptone broth for one month. The virulence of the solution may be gauged by the fact that one-tenth of a cubic centimetre, subcutaneously injected, killed a guinea-pig weighing 500 grammes in less than three days.

In the experiment shown in this chart (Chart II) each of two healthy rabbits received 0.5 c.c. of toxin into the vein of the ear, but in one 0.3 c.c. of antitoxin was added. The thick line on the chart represents the effect of the toxin alone on the temperature. It will be seen that on the first day following the injection there was practically no effect on the body temperature, but towards the end of the second day the temperature began to fall rather rapidly, and continued low on the third day, after which it was not taken. Paralysis supervened on the fifth day, and became general, and death ensued on the sixth day. In the animal which received the antitoxin as well as the toxin there was no effect on the body temperature, which did not fall or rise. No symptoms were observed, and the animal was killed in forty-one days, being fat and well nourished. The effect on the weight is shown on the lower part of the chart. In the animal that received the toxin alone the weight began to fall soon after the injection, and on the second and third days there was a rapid fall, nearly 250 grammes being lost during this time; and the weight continued to fall until death ensued on the sixth day. In the animal, however, that received the antitoxin and toxin there was a slight rise in the weight, which continued until the animal was killed. To all appearances, therefore, the antitoxin in this experiment completely counteracted all the effects of the toxin or the diphtheritic ferment. The absence of any effect on temperature, the absence of paralysis, and the gain in body weight show this. The *post-mortem* examination of the animal that died from the toxin showed well-

marked fatty degeneration of the heart muscle, and the characteristic nerve degeneration, which is shown in this photograph of one of the branches going to the vastus internus. (Fig. 1.) In the antitoxin animal there was no

Fig. 1.

fatty degeneration of the heart, but some of the branches of the nerves to the vastus internus showed the characteristic degeneration as in this photograph. (Fig. 2.) The dose of

Fig. 2.

antitoxin given to this animal, therefore, did not counteract all the effects of the toxin, since some nerve degeneration was produced. The immunity strength of the specimen used (British Institute of Preventive Medicine) was 1; therefore the amount injected was more than sufficient to counteract the effects of the toxin, according to the calculations in vogue.

A few other experiments were performed on the effect of the antitoxin in preventing the symptoms which have been described as produced by the injection of the diphtheritic albumoses into the blood. The albumoses were obtained from the spleens of patients dead of diphtheria. In one experiment, shown in Chart III, two rabbits each received intravenously on two occasions 7 centigrammes of albumose. In one animal 0.5 c.cm. of antitoxin was injected with each dose of the albumose—that is, 1 c.cm. in all. The thick line, which represents the effect of the albumose alone, shows

that after the first injection the temperature rose, then sank rapidly, recovering, however, the following morning. A second injection at this time produced high fever, succeeded by a fall on the same day, after which the temperature on the third and fourth days was practically normal. The animal that received antitoxin as well showed after the first dose no rise of temperature, but a well-marked fall, with recovery on the second day. A second dose now given showed a rise of

Chart III.

temperature, succeeded by a fall, after which, on the third and fourth days, the temperature was normal. The body weight, which is shown in the lower part of the chart, shows in both animals a gradual increase up to the eighteenth day and later, as in all healthy rabbits which are taken from the stock, placed in cages, and which receive an abundance of food. The antitoxin in this case, therefore, although it diminished, did not prevent the effects on the temperature which normally result from the injection of albumoses into the venous system.

In another experiment a much larger dose of albumose was given—namely, 0.125 gramme, on two successive days, followed by 0.072 gramme on the third day. In one animal antitoxin was given with the albumose, 1.4 c.cm. being given altogether (Chart IV). The effect on the temperature when the

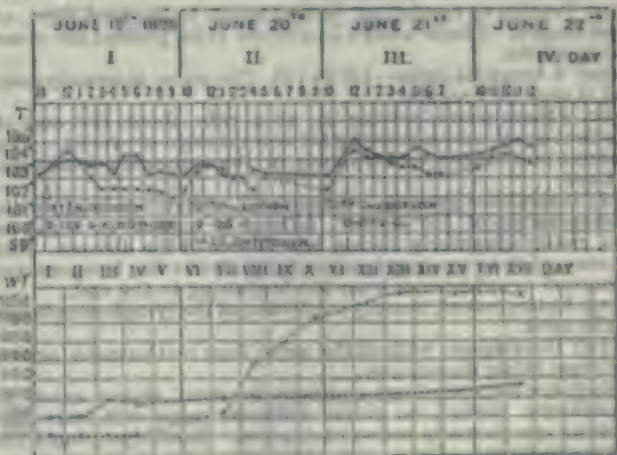

Chart IV.

albumose alone was given was a slight rise after the first dose, no rise after the second, but a well-marked rise after the third, lasting over the following day. In the antitoxin animal following the first dose was a fall of temperature, following the second dose practically no effect, following the third dose a rise of temperature of the same character as that in the first animal, but rather less in degree. The effect on the body weight is well marked. The animal that received the albumose alone showed a nearly stationary weight for seventeen days, there being a slight increase, but very slight.

The animal that received the antitoxin as well as the albumose, however, showed after the first week a rapid rise of body weight, contrasting strongly with the first animal. The animal that received the albumose alone showed on the fourth day slight weakness in the hind legs; on the sixth day this was more pronounced, and gradually increased till the seventeenth day, when it presented an appearance in marked contrast to the antitoxin animal: the latter was lively, and walked about the room like an ordinary rabbit; the former, when taken out of its cage, lay quite quiet, the legs half extended; it walked but little, and then with only feeble attempts. Both animals were killed on the twenty-third day. It was found that in the rabbit that received the albumose alone there was well marked fatty degeneration of the heart, as well as nerve degeneration; while in the animal that received the antitoxin as well there was no fatty degeneration of the cardiac muscle, and although nerve degeneration was present it was insignificant in extent.

These experiments are only the commencement of an inquiry into the subject, but they are in themselves quite definite, and tend to show that the antitoxic serum is capable of counteracting the poisons which are found in the tissues of patients dead of diphtheria. It has only a slight effect on the feeble rise of temperature produced by the albumen, but it completely counteracts the fatty degeneration of the heart produced by these substances, and to a great extent also the nerve degeneration.

II.—E. W. GOODALL, M.D.,

Medical Superintendent, Eastern Hospital, Holmerton.

The points concerning diphtheria and its treatment set down for discussion in this Section are so many, and the time for speaking so short, that I must confine my remarks to the following:

1. The symptoms of severe cases of diphtheria, especially as regards the mode of death.

2. The general results of the antitoxic treatment, drawn from the personal observation of cases.

(1) In a severe case of diphtheria there are:

(i) Extensive exudation, that is, the exudation covers or affects at some time or other the tonsils, uvula, soft palate, pharynx, and often the posterior parts of the nasal fossae, in which case there is a discharge from the nose, the worst form having a gelatinous appearance.

(ii) Persistent exudation, lasting seven to fourteen days, or even longer. I have known exudation to be present for close on six weeks.

(iii) A frequent pulse—120 to 150. The pulse is usually soft, and it may be irregular.

(iv) Albuminuria, setting in, as a rule, about the end of the first week, and persisting for several days or weeks. The amount of albumen varies much in the same case from time to time.

(v) Sometimes pyrexia. A case will sometimes begin with a temperature of 103° or 104°, falling to normal in a day or two, rising irregularly during the course of the disease. But in some of the very worst cases of diphtheria the temperature is normal or subnormal from the beginning to the end.

(vi) Enlargement, usually moderate, of the lymphatic glands of the neck.

(vii) Drowsiness, with at the same time restlessness, active delirium being uncommon.

Such are the symptoms common to most severe cases of diphtheria, though no doubt different cases will have the various symptoms in different degrees. These symptoms are toxic symptoms. Cases presenting these symptoms may recover. On the other hand they may, and often do, prove fatal, usually by cardiac failure (ignoring for the present cases where the larynx, trachea, etc., become invaded). Again, to these symptoms may be added others still more grave, symptoms which usually herald a fatal termination, and it is of these I wish now to speak. These symptoms are frequent vomiting, anuria, a hemorrhagic condition, and convulsions.

Frequent vomiting, either after or independently of food, may occur apart from anuria, but it is more often found in connection with this symptom. It is an exceedingly grave symptom; it may be met with not only in the membranous, but also in the paralytic stage.

Of anuria I have written elsewhere, so that now I will only observe that it may be partial or complete; that it may come on suddenly or slowly; that it is almost invariably preceded by albuminuria, so that this latter symptom is of more prognostic importance than is usually believed; that there is with the anuria progressive cardiac failure, and often a progressive slowing of the pulse rate. In some cases the patient, to a careless or unskilful observer, may appear to be getting better; for the local exudation has disappeared, and the child, far from being unconscious, may be amusing himself with pictures, toys, etc., even when the anuria has lasted a day or two, and he is within thirty-six or even twenty-four hours of death. It is important, therefore, in all severe cases of diphtheria, to pay attention to the quantity as well as the character of the urine.

In hemorrhagic diphtheria there are hemorrhages in the skin and subcutaneous tissue, and into the retropharyngeal and retroperitoneal tissue, the hemorrhages being such as are seen in purpura, that is, either small or large and onion-like. Hemorrhage may also take place from any of the mucous surfaces, especially the gums, lips, stomach, and intestines; a necropsy will reveal subcutaneous hemorrhages in these organs. Occasionally, too, there are hemorrhages into the lungs, beneath the pleura, epicardium and endocardium, and into the heart muscle.

Convulsions are a certain sign of approaching death. They occur apart from anuria as well as with that condition. There may be only localised muscular twitchings or generalised convulsions.

There is hardly another of the acute infectious diseases besides diphtheria in which the modes of death are so various. The patient may succumb during or soon after the membranous stage to heart failure, anuria, or convulsions, or he may have constant vomiting and diarrhoea, and die of inanition; the membranous formation may spread to the larynx and trachea, and he may be suffocated. Should tracheotomy be performed he may still perish from extension of membrane or lobular pneumonia. For weeks after the primary sore throat he is liable to be attacked by paralysis, which brings its risks of death from syncope, vomiting, respiratory failure, choking, or septic lobular pneumonia.

I have made these observations because some of these symptoms have been ascribed by some observers to antitoxin.

(3) From January 1st to June 30th of this year I have had under my care or observation 241 cases of diphtheria under 15 years of age, in all of which the diagnosis has been confirmed by a bacteriological examination. Of these 105 have been treated with antitoxin, 136 without: 24 of the former have died—a mortality of 22.8 per cent.; of the latter 45—a mortality of 33.0 per cent. Arranged according to ages the cases are as follows: (Also 4 adults.)

Treated with Antitoxin.

Under 5 ...	57 cases, of whom	17 died = 29.8 per cent.
5 to 10 ...	36 "	5 " = 13.6 "
10 to 15 ...	12 "	1 " = 8.3 "
	105	24 = 22.8 "

Treated without Antitoxin.

Under 5 ...	67 cases, of whom	20 died = 29.9 per cent.
5 to 10 ...	45 "	14 " = 30.4 "
10 to 15 ...	23 "	1 " = 4.3 "
	136	45 = 33.0 "

Of the cases treated with antitoxin 54 per cent. were under 5, 34 per cent. between 5 and 10, and 12 per cent. between 10 and 15; while of those not treated with antitoxin 49 per cent. were under 5, 34 per cent. were between 5 and 10, and 17 per cent. were between 10 and 15. As regards age distribution, therefore, the numbers are in favour of the cases not treated with antitoxin; you would expect, I mean, a lower mortality with these cases. During January and the first half of February, the latter part of May and the whole of June, no cases were treated with antitoxin, but during the remaining period all cases were treated, except some which were very mild or doubtful. These cases will be of the higher ages rather than the lower.

It will be observed that the figures of the cases not treated

with antitoxin show that for the first and last six weeks of first half of this year the diphtheria cases admitted into the Eastern Hospital have not been of so severe a type as they were during 1893 and 1894; for these years the mortality of cases under 15 years, even when uncorrected by bacteriology, was 41.8 per cent. and 38 per cent. respectively. Yet even if we assume that for the first half of the present year the cases were all of a milder type than before, the figures are distinctly in favour of the antitoxin treatment. The mortality of the cases under 10 treated with antitoxin is 24.4 per cent., of cases under 10 not so treated 39.2 per cent. For the cases under 10 occurring in 1893 and 1894, uncorrected by bacteriology, the mortality was 39.3 per cent.

In 61 of the 241 cases there was evidence of laryngeal implication, and in 39 cases tracheotomy was performed; 25 of these 39 cases were treated with antitoxin and 16 recovered—that is a proportion of 64 per cent. Of the remaining 14 tracheotomies who were not treated with antitoxin only 4 recovered, or 28.6 per cent.

Of laryngeal cases not tracheotomised there were 7 cases treated with antitoxin with 5 recoveries, and 15 not so treated with 10 recoveries—proportions of 71 and 66 per cent. respectively. These figures are all in favour of antitoxin.

In 36 of the 105 antitoxin treated cases there was albuminuria, = 53.3 per cent. In 9 of these there was anuria more or less complete.

In 67 of the 136 cases not treated with antitoxin there was albuminuria, = 49.2 per cent. In 12 of these cases there was anuria.

In not one of the 241 cases was nephritis observed.

Antitoxin does not therefore lessen the incidence of albuminuria; nor will it, if employed too late, prevent anuria.

In 18 of the 105 antitoxin treated cases there was paralysis, 17.1 per cent. Four of these cases were fatal.

Of the 136 cases not treated with antitoxin, 20 developed paralysis, 14.7 per cent.; and 3 of these died.

Antitoxin does not therefore prevent the occurrence of paralysis; in fact in this series of cases 2.4 per cent. more occur in those treated by it than in those treated in other ways.

With respect to this difference I would point out (1) that paralysis follows severe cases of diphtheria more often than it does mild; and (2) that paralysis is met with if the cases of diphtheria—fatal during the membranous stage of the disease—are excluded, more frequently in patients under than over 10 years of age.

The more severe a case of diphtheria the more likely is the patient, if he survives the membranous stage, to be attacked by paralysis. I should expect, therefore, if antitoxin (or for the matter of that any other drug) afforded material help in tiding patients through the membranous stage, that the percentage incidence of paralysis would become higher.

III.—ALEX. JOHNSTON, M.D.,

Physician Superintendent of the Belvidere Hospital, Glasgow.

With regard to the spread of diphtheria, Dr. Johnston said that five points needed consideration:—

1. It is due to a specific poison which breeds true.
2. The disease spreads usually by direct infection from person to person.
3. Aerial diffusion is possible (but slight in hospital wards where precautions are taken to collect and destroy all matter coughed up by patients).
4. Young children are most susceptible and readily infected when brought into close contact in schoolrooms with a child suffering from a mild attack of the disease.
5. The association of spread of diphtheritic infection with defective drainage is possible, but not proven (untenable as far as recent research goes in Glasgow).

Referring to the parts played in the process by (1) staphylococci, (2) streptococci, (3) septic bacilli, (4) Loeffler's bacilli, Dr. Johnston proceeded as follows: It seems improbable that only one of these bacteria is concerned in producing the phenomena of diphtheria, local and constitutional. That one only (Loeffler's bacillus) may be concerned is possible, yet I have seen unnumbered cases of diphtheria where the so-called diphtheritic bacillus could not be found. Again, I have seen at

least one case of scarlatina (confirmed afterwards by the characteristic desquamation of the cutis) treated by inoculation with the diphtheritic antitoxic serum on the presumption that it was a case of diphtheria because the characteristic Klebs-Loeffler bacillus had been obtained from the patient's fauces. Granted that the Klebs-Loeffler bacillus is both pathognomonic and pathogenic and that the theories of chemical poisoning are correct, we ought to expect a startling reduction in the mortality from diphtheria on applying the results to practical treatment. The results so far are disappointing, and the natural inference is that the processes are more numerous or more complicated than described.

The effects of the antitoxic treatment on the disease are: (1) Local, (2) general, (3) sequelae.

Local.—Occasionally I have seen a more rapid separation of the membrane than I expected, but not sufficiently often to establish a rule. In laryngeal cases where tracheotomy has been performed I have seen the best results of all from the use of antitoxin. The membrane was coughed up quickly and easily, and the recoveries were above the average. But in this operation my experience has been that a series of successful cases may be the good fortune of a man at any time, without any apparent special cause acting. Recently, in Belvidere, we had five consecutive recoveries from tracheotomy in diphtheria; but two years ago the same thing happened when no antitoxin was employed.

General Condition.—Practically nothing has been noticed at all different since the use of the antitoxin. Sudden improvement after injection of antitoxin has been distinguished by its absence.

Sequelae.—Paralysis of the soft palate has been noticed to occur in about the same proportion of cases treated by antitoxin as formerly.

Altogether I cannot say that I have seen any injurious effects produced by the use of antitoxin, and I believe that the results, on the whole, are, as far as they go, favourable to its use. At the same time, I would advise those who use antitoxin not to expect too much, and to be satisfied with the benefits obtained, slight though they be.

The first attempts at treating diphtheria by means of the antitoxic serum were made in November, 1894. The serum used was obtained from the British Institute of Preventive Medicine, through the kindness of Dr. Armand Ruffer. The mode of using the antitoxin has been in accordance with the printed regulations of that institution.

At first all cases were treated with antitoxin, with the striking result that all the severe cases (which experience said were likely to end fatally) died, while the mild cases recovered: 8 cases, 5 severe (died), 3 mild (recovered).

It was soon quite apparent that no benefit was to be obtained by using the antitoxin in cases *in extremis*, and that nothing was gained from its use in very mild cases. Thus our practice became one of selecting cases for the special treatment, excluding cases *in extremis* and very mild cases, that is, treating by antitoxin injection only moderately severe well-marked cases.

IV.—Professor Dr. VON RANKE, University of Munich.

During the time from September 24th, 1894, to July 1st, 1895, 197 cases of diphtheria were admitted into my clinic at Munich.

From these have to be deducted all cases complicated with scarlet fever and measles, as well as the cases still under treatment on July 1st.

So there remain 163 cases of primary diphtheria with a mortality of 29 = 17.7 per cent.

Of these 163 cases, the last 145 were examined bacteriologically under the personal control of my colleague Professor Hans Buchner, the successor of Professor von Follenkofer.

In 136 of the 145 examined cases, the Loeffler bacillus was found present in the pharynx, that is, in 93.8 per cent.

But only in 12 cases the Loeffler bacillus was present in undoubted predominance (in pure culture). In 124 cases = 83.5 per cent., it was greatly mixed up with streptococci.

Only in 9 cases the Loeffler bacillus was not found. If we deduct these 9 cases as not being real diphtheria, there remain 154 cases of undoubted diphtheria, with a mortality of 18.8 per cent.

But for the comparison with the mortality of former years, when this bacteriological distinction was not made, we have to abide by the figures of 17.7 per cent.

Ninety-five cases showed at the time of their admission into the clinic symptoms of croup = 58.3 per cent.

In 27 cases of undoubted diphtheritic croup, the croupy symptoms, that is, the symptoms of laryngostenosis, ceased soon after the injection of the serum = 25.4 per cent.

In 61 cases, that is, in 41.1 per cent. of all admitted cases of primary diphtheria, an operation for relieving the laryngostenosis had to be performed. This operation consisted in the first place in intubation. Of these we lost 20 = 32.7 per cent.

In 1 of the 41 intubated and cured cases, intubation gave no immediate relief, so that it had at once to be followed by tracheotomy. Of the other 40 cured cases:—

6	wore the tube less than 24 hours	= 15.4 per cent.
30	" "	" "
48	" "	" "
50	" "	" "
72	" "	" "
96	" "	" "

Only 3 = 7.5 per cent. had to wear the tube longer than four days, and in all these secondary tracheotomy was performed.

INTUBATION.

Of the 68 cases that had diphtheria of the pharynx only, without complication of the larynx, we lost only 2 = 2.9 per cent; both cases had been ill already seven and nine days before they were admitted, and both died from heart failure after the diphtheritic membranes had disappeared.

Among the 68 cases of pure pharyngeal diphtheria there were 19 with the clinical symptoms of septic diphtheria (fester, large discoloured membranes, etc.); of these 19 cases we lost 1. In 2 other cases of septic diphtheria the larynx also was attacked; both cases died, so we had 21 cases of septic diphtheria with only 3 deaths = 14.3 per cent. mortality.

In 158 of the 163 cases treated with serum the day of commencement of the disease could approximately be determined.

Of 19 cases admitted on the first day we lost 1 = 5.2 per cent.
47 " " " second " " 4 = 8.5 "
39 " " " third " " 7 = 17.9 "
10 " " " fourth " " 3 = 16.8 "
9 " " " fifth " " 3 = 11.1 "
10 " " " sixth " " 4 = 40.0 "
15 " " " seventh & later " " 7 = 46.6 "

Mortality of Patients according to Age.

Under 12 months old	5, all of whom died = 100.0 per cent.
" 2 years old	24, of whom 9 died = 37.5 "
" 3 " "	26 " " 3 " = 12.0 "
" 4 " "	23 " " 3 " = 12.5 "
" 5 " "	17 " " 2 " = 11.8 "
" 6 " "	20 " " 2 " = 10.0 "
" 7 years old & more so	3 " " = 3.7 "

COMPARISON.

Mortality of Primary Diphtheria in the Clinic in Former Years.

1897 42.2 per cent.	1891 46.0 per cent.
1898 45.9 "	1892 46.2 "
1899 46.5 "	1893 46.0 "
1900 47.9 "	1894, till Sept. 24th ... 57.0 "
Since the period of the serum treatment, from September 24th, 1894, till July 1st, 1895, 17.7 per cent.	

The mortality has therefore been reduced to considerably more than one-half, compared with the best years, and to two-thirds compared with the worst year.

Among the cases operated upon for laryngostenosis we also have a reduction of the mortality to nearly one-half of the figures in the former years.

But what seems to me to prove the value of the serum treatment even more than these statistical figures, is the change in the clinical course of the disease.

Under the influence of the serum treatment diphtheria loses its progressive character. This comes out most remarkably in regard to diphtheritic laryngostenosis.

Amongst all my cases I have not had a single one in which laryngostenosis developed itself after injection, if symptoms of it had not been present already on admission.

As I stated, in 27 cases of undoubted diphtheritic croup the symptoms of laryngostenosis subsided after the injection.

That is in 25.4 per cent. Formerly this happy result occurred in my clinic at the most in 5 per cent.

Then all cases requiring an operation for the relief of laryngostenosis were operated upon within the first twenty-four hours after admission.

Formerly an operation for croup might have become necessary any day during the course of the disease.

And another point is, that if a case has to be intubated, to avoid asphyxiation, the tube can be removed considerably sooner than it was possible before the serum treatment. I may not trespass too much on your time by giving you the exact figures in this respect.

Now, gentlemen, these changes in the clinical course of diphtheria prove to my mind more than general statistics can do that we have really got in the serum treatment a most powerful and specific remedy against that disease.

V.—LENNOX BROWN, F.R.C.S. Edin.,

Senior Surgeon Central Hospital for Diseases of the Throat.

Mr. Brown commenced by stating that although his enthusiasm in regard to the serum treatment of diphtheria was somewhat more modified than that of other speakers, as the result of a daily watching of its effects in a public hospital for nearly four months, he desired to deprecate any suggestion that he was adverse to this system of remedy or to those scientific investigations on which it was founded. On the contrary, nobody would be more pleased than himself should it be ultimately proved that the conclusions at which he had unavoidably arrived were negated in favour of the new treatment. Certainly the figures given by Professor von Ranke would go far to that end. The first point to be considered was that the results of the interesting experiments performed by Dr. Sidney Martin were not verified by practice at the bedside. For example, we had been told that antitoxin injected at the same time as toxins or toxic albumens completely counteracted fatty degeneration of the heart and lesions of the nerves. But in practice it was found that serum injections did not prevent either cardiac failure or paralysis. Indeed, Dr. Goodall had shown that the incidence of paralysis was somewhat more frequent in cases treated with the serum, and this had been his own experience. Dr. Woodhead had also laid down the maxim that antitoxin could not affect organic lesions.

A great deal too much had been made of the effect of antitoxin on the temperature, which—albeit trifling and of brief duration—was in the direction of elevation rather than of decrease; and Dr. Martin's experiments had proved this.

The same observer's statements as to the improvement in weight under serum treatment was contrary to those of Arloing, who had found that both in regard to nutrition in the grown rabbit and to the growth of the young, normal as well as antitoxic serum acted prejudicially.

Further, with regard to nephritis: many observers—Dr. Woodhead, among others—held that the kidneys were affected to a greater or less degree in every case of diphtheria; thus minimising the experience of the speaker, who was in accord with the observations of Hansmann, Benda, and others, that the tendency to parenchymatous changes in those organs was almost constant in the cases which were examined *post mortem* after serum treatment. Dr. Goodall, on the other hand, had just stated that out of 241 cases there was not a single one of nephritis, but a few months ago at the Clinical Society he had stated that anuria, etc., was common.

Another point to be considered was the class of cases suitable for this treatment. It was laid down by many that the serum was not advisable in cases of mixed diphtheria, and Dr. Woodhead had stated recently that pure diphtheria was found in 80 per cent. of them, which the speaker thought was rather a large proportion. Professor von Ranke, however, had just said that in 197 cases, after eliminating all complicated by scarlet fever and measles, he had found only 12 cases out of the remaining 163 which gave pure cultures. Dr. Goodall had stated that the mortality in his cases under 15 years of age treated with antitoxin was 22.8 per cent., but had he not included 12 cases between 14 and 15 in which but one death occurred, his mortality would have been 24.7 per cent. for all cases under 10 years.

The speaker had shown in a comparative study at the North-Western Fever Hospital—presided over by Dr. Gayton, the *doyen* of medical superintendents—that the mortality of 27 per cent. on a total of 1,103 cases treated in 1891 was exactly the same as that which occurred in the first 100 cases treated with antitoxin in 1895, and it was contended that if comparisons were to be made between old and new treatments they must be based, not on the previous mortality of 40, 50, or 60 per cent., but on those at such an institution as that mentioned, where, on a total of nearly 2,500 cases treated, the mortality prior to antitoxin had been under 27 per cent.

Mr. Browne then proceeded to consider some of the fallacies of published statistics, and particularly drew attention to those which had been published during the past year in the *BRITISH MEDICAL JOURNAL*. He concluded by saying that it was abundantly evident that with suitable precautions the results, in this country at any rate, under serum treatment and under former methods at command did not at present justify the claim of antitoxin to so high a therapeutical eminence as at foreign centres of observation. This discrepancy, it was submitted, was mainly due to the greatly diminished mortality long obtaining in England, and this was in turn due to the improved conditions of *personnel* and hygiene in this country, much in the same way as those who oppose Listerism can only show comparable results by strict observance of the laws of cleanliness, which are absolutely inseparable from Listerian principles.

VI.—Professor Dr. A. BAGINSKY, University of Berlin.

PROFESSOR BAGINSKY stated that during the past year he had treated 525 cases of diphtheria with serum. Previous to the introduction of this form of treatment the mortality had during four years averaged 41 per cent., whilst now it was only 15.6 per cent. Further, when the cases came to be examined in detail, the improvement was even more striking.

Of cases under 2 the previous mortality was 68.8 %, whilst now it is 25.20 %	
“ from 2—4 “ “ 52.85 “ “ 17.12 %	
“ “ 4—6 “ “ 37.90 “ “ 17.24 %	
“ “ 6—8 “ “ 27.41 “ “ 11.30 %	
“ “ 8—10 “ “ 18.18 “ “ 5.11 %	
“ “ 10—12 “ “ 15.07 “ “ 10.00 %	
“ “ 12—15 “ “ 13.00 “ “ 0.12 %	

As to the general condition of the patients Dr. Baginsky considered that the serum treatment not only reduced the mortality, but that the whole condition of the children was improved, that there was very much less danger from heart failure, that there were fewer cases of nephritis, that there was less danger of laryngeal stenosis, no case in his experience ever having had laryngeal obstruction unless this condition had been present before the treatment had been commenced, and that intubation was always possible, whereas under the older treatment tracheotomy was very often necessary.

VII.—G. SIMS WOODHEAD, M.D.,

Superintendent of the Laboratory of the Royal Colleges of Physicians and Surgeons.

DR. SIMS WOODHEAD was of opinion that up to the present the remedy had not in England been used in sufficiently large doses, and that this perhaps explained the better results that had been obtained on the Continent. In rabbits he had obtained the best results when he had used large doses. He further thought that one of the most important effects produced was an alteration of the type and course of the disease, the serum-treated cases running a milder course and showing less tendency to the onset of complications. The speaker then quoted some statistics from a recent paper by Kichet of Paris. In Paris from 1884 to 1891 the smallest number of deaths from diphtheria per hundred days had been 25, whilst the highest number had been 116 in the same period. In 1892, however, whilst the highest figure was 27 the lowest was 4. Dr. Woodhead further thought that the period of international enthusiasm had now been passed, and that in the opinion of all those who had had much experience of diphtheria and its treatment by antitoxin this remedy had proved its claim to be far above all other remedies for the cure of the disease.

VIII.—HERMANN BIGGS, M.D.,

Bacteriologist to the Board of Health, New York.

DR. BIGGS stated that he had had under his charge in New York between 400 and 500 cases which had been treated with antitoxin for diphtheria in their own homes. These had all been severe cases, and the mortality had been slightly over 16 per cent. The mortality for the whole of New York, he added, had been reduced by over 40 per cent. The speaker then proceeded to deal with the importance of antitoxin in preventing the spread of the disease by rendering those who were exposed to the infection immune. In one institution in New York there had been a large number of cases of diphtheria, 107 cases having occurred during the 103 days preceding the injection of the serum. The antitoxin was then injected, 200 units of Behring's preparation being used in each case. During the next thirty days only 1 very mild case occurred, in the following thirty days another case was reported, and shortly after 5 more patients were attacked; 225 units were then injected, with the result that no more cases occurred. The same result was obtained in three other institutions, showing the extreme value of the immunising power of the serum. Dr. Biggs considered that the protective period was a short one, probably not extending over thirty days, but within this time it was almost absolute. The speaker concluded by saying that in over 800 patients treated for the purpose of rendering them immune, he had in no case observed any unfavourable symptoms. In a few patients, rashes, apparently urticarial in nature, had occurred on the eighth day, and in some there had been a temporary rise of temperature, which, however, in no case had resisted treatment for more than twelve hours.

IX.—J. CAMPBELL HALL, M.D., Monaghan.

DR. CAMPBELL HALL stated that he had been studying diphtheria for the past sixteen years, but in his hands no other form of treatment had produced such satisfactory results as the treatment by antitoxin, and in the future he would never feel justified in neglecting the serum treatment in any case which he was called upon to deal with.

THE TREATMENT OF DIABETES MELLITUS BY URANIUM NITRATE.

By SAMUEL WEST, M.D., F.R.C.P.,

Assistant Physician to St. Bartholomew's Hospital; Senior Physician to the Royal Free Hospital.

SOME time ago my colleague at St. Bartholomew's Hospital, Dr. W. J. Russell, the lecturer on chemistry, placed in my hands a double chloride of quinine and uranium, and suggested that I should try its action in disease.

Uranium is interesting as having the highest atomic weight, 240, and forming the remarkable series of salts, many of them with beautifully coloured crystals, the uranic and uranous salts. The two salts employed in these investigations were both of them uranic salts, namely, the double chloride and the nitrate. The nitrate is a very acid salt, soluble in half its weight of water. In order to obtain the fine crystals, in which it is usually sold commercially, they have to be deposited from a solution strongly acidified with nitric acid, and even the crystals contain a certain amount of free nitric acid also. Being so strongly acid it was thought wise to administer it in small quantities at first after food and well diluted with water, and to increase the doses gradually.

The physiological action of uranium salts has been very little studied. In 1824 Gmelin first investigated its action upon dogs, and found that in large doses it produced vomiting, but in small doses had little effect. In rabbits doses of 34 grs. killed the animal with heart paralysis. When injected into the veins of rabbits much smaller doses proved fatal in a very short time—3 grs., or even less.

Lacaze in 1851 stated that prolonged administration of small doses to dogs produced glycosuria. On this Dr. Hughes, a homoeopathic physician, suggested the use of uranium in diabetes. He tried it, he stated, in several cases, and found that many were relieved and several com-

pletely cured. The doses that he used were from $\frac{1}{16}$ gr. to $\frac{1}{4}$ gr.

Beyond these stray observations nothing, I believe, was done until Chittenden published his first paper in 1888,¹ and a second, in association with Lambert, in 1889.² He found that in full doses uranium acted as an irritant poison, producing gastro-intestinal irritation, but when administered to rabbits in full doses it caused rapid emaciation, and the animal died with general weakness, loss of co-ordination, and paralysis of the locomotor muscles. Besides these symptoms in dogs acute parenchymatous nephritis was produced, with much albumen in the urine. After the albumen a few days later sugar also appeared in the urine, and this they regarded as very characteristic of uranium poisoning.

Further investigation showed that even in small quantities uranium and its salts had an inhibitory influence on amylolytic and proteolytic action, so that a few drops of a 1 per cent. solution of the nitrate of uranium prevented the action of ptyalin, and a rather larger quantity that of pepsine and trypsin.

The explanation which the authors gave of this action was that nitrate of uranium formed in combination with albumen a more or less constant and indigestible compound. When administered by the mouth the drug acted slowly, and small doses seemed to be almost as efficacious as large doses. For instance, they obtained the same effect with $\frac{1}{2}$ gr. as with 1 gr.

When administered by injection into the veins, the drug was rapidly fatal, and even in small doses it caused a rise of temperature and an increased excretion of carbonic acid. Further investigation showed that the presence of albumen in the urine was due to a specific destructive action of the salts on the epithelium of the kidney, that sugar was produced in the urine only after poisonous doses, an effect also produced, they state, in poisonous doses of mercury and phosphorus.

On administering to a dog weighing 18.8 kilos. uranium nitrate in doses of $\frac{1}{4}$ gr. albumen appeared in the urine after taking this amount for five days, and this was followed five days later by the presence of sugar. On stopping the administration of uranium the sugar was the first to disappear, then the albumen; and then, on renewing the administration of the drug, neither albumen nor sugar appeared until the doses were increased up to ten times the original toxic amount, namely, 4 grs. This would seem to show that some tolerance was gradually established.

This represents, so far as I can ascertain, all that is known of the physiological action of uranium.

In considering in what class of cases it might be most profitable to investigate the action of the drug, my attention was directed to diabetes, for there was first of all the statement that it had been tried in that disease and had been found useful, although the evidence upon which the statement rested was not very conclusive; and further, there was the statement that the drug had a powerful action upon amylolytic and proteolytic digestion.

Having selected diabetes as the class of case to investigate, I next administered the drug in a routine sort of way to a number of diabetic out-patients, with a view of seeing if any obvious action could be traced. I gave small doses at first and gradually increased them, not knowing how much a patient would be able to stand. I found after the drug had been administered a short time only that all the patients without exception stated that their thirst was greatly relieved, and the frequency of micturition and the quantity of urine passed greatly reduced. This result seemed very promising, and I then instituted a careful investigation by means of daily examination of the urine of certain patients whom I took into the wards for that purpose. The first patient I had under observation for more than twelve months, and during that time an almost daily examination of the urine was made, and a careful record kept of the patient's weight, diet, and general condition. The second case has also been under observation for a long time, though not under the close supervision that is possible with a hospital patient, the lady being a private patient, and seen by me from time to time in consultation with her doctor. I have, however, the advantage of

a very long series of determinations and analyses of the urine made by her husband, whom I instructed in the processes, and whose results I have from time to time carefully checked. In all cases I have tried to place the patient under constant conditions, so that the only difference should be the administration or withholding of the drug which I was investigating; that is to say, they were all placed upon the usual strict diet, and placed under constant conditions. The results were then recorded for some little time—a few weeks or so in each case—before the administration of the drug. Then the drug was given, and the results then obtained compared with those previously recorded.

Besides the effect of the drug under investigation, the records show many other points of interest in respect to diabetes which will be referred to in their proper place.

CASE I.—The first case is that of F. S., a lad aged 21, who had complained of thirst, loss of flesh, and frequent micturition for a period of six weeks. The urine was found to be of high specific gravity (1036) and to be loaded with sugar. He was taken into the hospital, kept in bed, and dieted. The effect of this change in his habits of life is well shown in the increase for the next few days in the amount of sugar and the

Chart I, showing the amount of urine, the percentage of sugar, and the total excretion of sugar before and after the use of uranium nitrate, the diet being throughout the same.

amount of urine. This is in accord with what is well known in diabetes, that any sudden change in the conditions of life for the time aggravates the disease. I shall have to draw attention to the effect of a specific disease, namely, influenza, in another case in producing the same result.

The next point of interest which the table clearly shows is the unsteadiness, both in the quantity of urine, the percentage, and the amount of sugar, so that the rise and fall, occurring at intervals of a few days, shows itself in the tables in the form of waves. This unsteadiness again is very common in diabetes, and is to be observed under any sudden change of conditions as well as when the disease is in an acute or active stage.

The diet and general treatment effected a considerable improvement in the patient, so that the percentage of sugar was reduced to 6, having been on admission more than 8, and

¹ *Therapeutic Gazette*, 1888, p. 693.

² *Zellch. f. Biologie*, 1889, p. 513.

having risen on one occasion to as much as 10 per cent. Five pounds in weight were also gained, and the patient appeared and felt very much better.

Having now got the patient into a condition of more or less equilibrium, uranium was administered in the form of the nitrate, and, as the dose of this drug was not established, it was at first given in small quantities—1 and 2 grs. three times a day—but this quantity was gradually increased up to 10 or even 20 grs. three times a day, when it was found that it could be tolerated by the stomach without disturbing the digestion.

The first effect noticed was that which the out-patients had already stated to occur, namely, the diminution in the amount of water and the decrease in the thirst. The amount of urine, it will be seen, fell from an average of between 4 and 5 pints to an average of about 3. This of course greatly diminished the total amount of sugar passed in the twenty-four hours, as one of the tables shows.

The percentage, however, of sugar did not fall materially until the medicine had been taken for more than fourteen days. It then fell to a mean of 4 per cent., varying, however, from day to day considerably between 3 per cent. and 5 per cent. As the improvement continued, the oscillation became less, and the tendency towards a more or less fixed percentage became marked.

The uranium was gradually increased up to 15 grs. by the commencement of June, that is, after a period of six weeks, during which period there had been an increase in weight of 5 or 6 lbs. The percentage fell further, and became more or less constant, about 3.5, and there was a further decrease in the amount of urine, the quantity averaging between 2 and 3 pints daily, and the total daily excretion of sugar, which had been as much as 5 ounces, was now under 1 ounce. The uranium was now gradually reduced, and about the third week in June the administration was stopped.

For a time no change occurred in the patient, but after about ten days the percentage of sugar again rose, and in the course of a week reached to between 5 and 6; the quantity of urine, however, was not materially altered. This is shown in Chart II.

Chart II, showing a relapse after uranium was given up, the slight effect only of small doses of the salt, and the marked effect of larger doses.

On July 18th the administration of uranium was again commenced, but this time not in the form of the nitrate, but as a double chloride of quinine and uranium. As the action of this form of the drug was not known, the administration was commenced in small doses, and it was not until July 30th that 6 grs. had been reached, given three times daily.

The smaller doses seemed to have little effect, but as soon as 6 grs. three times a day was reached, a sudden drop in the amount of urine and the percentage took place, the percentage falling to about 3 and the quantity to about 55 ounces. The dose was now increased to 10 grs., and during the month of August, sometimes the nitrate and sometimes the double chloride, according as the supply of these drugs held out, was administered. In the course of September a still further fall gradually took place in the percentage of sugar, until it reached below 1, the amount of urine ranging between 40 and

50 ounces. The uranium was then reduced in quantity gradually to 3 grs. three times a day, and this was continued for some time longer; and during the months of October, November, and December there was hardly more than a trace of sugar present, oftentimes considerably under the 1 per cent.

In the middle of November toast was permitted in the place of gluten bread, the uranium being continued in the same doses. This, however, caused no change in the condition of the urine, and appeared to do the patient no harm, so that he was allowed to have an amount of 6 ounces of toast daily, and this he had till Christmas time. The patient was now about a stone heavier than when he was admitted.

Chart III, showing an obstinate relapse after Christmas festivities, which ultimately again yielded to uranium.

After Christmas time the patient was found to be not quite so well. The percentage was found to be much higher, fluctuating and reaching to nearly 6 per cent, while the urine was also increased in quantity; the patient had also lost 2 lbs., and looked more ill. Presumably this relapse was due to some error of diet during the Christmas festivities. Ordinary treatment having no obvious effect, and the percentage still continuing to rise, at the end of a fortnight the patient was placed upon 5 grs. of uranium three times a day. This, however, had no effect, and the percentage still rose, till in the middle of February it once reached as high as nearly 10, though it averaged about 8. The uranium was increased rapidly to 15 grs., but it was not till this amount had been taken for nearly three weeks that its effect was produced, and then—that it to say about the middle of March, the percentage fell to about 4, and having begun to fall the fall continued, until at the end of March the sugar was almost gone, and the urine contained but very minute traces of it, a great deal below 1 per cent., and so this continued to the end of May, the uranium having some time previously been gradually reduced to 5 grs. three times a day, which dose the patient continued to take.

At the end of May and during the early part of June the percentage rose again to between 1 and 2, and finally, when the patient left the hospital in the middle of June, the percentage was about 2, and the quantity of urine about 50 ounces. The patient presented none of the symptoms of diabetes, nor did he look ill. He said he felt well and strong, and left the hospital with the intention of going to work.

He was warned to be careful with his diet and his habits, but he disappeared entirely from observation for several months, and did not appear again until October, when he told us he had been harvesting, living a good deal in the open air and under rough conditions. He came back because he did not feel so well. He had been for about three months without any of the medicine.

Chart IV shows his condition, the percentage of sugar at this time and the effect of the administration of uranium subsequently. On October 19th, when he first presented himself, the percentage of sugar was 6. On the 19th 6, and on the 20th a little more than 6.5 grs. of uranium were given, and subsequently 10. By November 30th the percentage had

fallen to a little below 4. At Christmas time, probably again in consequence of the festivities of the season, the percent-

Chart IV, showing release after an absence from the hospital for three months, and its ultimate subsidence under uranium.

age was as high as 8; 15 grains of uranium were given, and the percentage rapidly fell, and by the end of January was constantly under 2. During the whole time since October the patient had been regulating his diet as far as he was able as an out-patient, and had been eating about 6 ounces of toast.

CASE II.—The second case is that of Mrs. W., a married lady, 46 years of age, without children, who had been in robust health until about 6 months before I saw her, at which time she began to suffer with irritation of the pudenda, frequency of micturition, thirst, and loss of flesh. Examination of the urine showed that she was diabetic. She was placed upon a fixed diet and treated with various drugs. She weighed at the commencement of her illness 9 st. 3 lbs., but about a year previous had reached 10 st., which was much above her usual weight, and she was distressed then to find herself growing fat. I saw her in consultation with Dr. Brown, of Tring, and I suggested the administration of uranium. The husband was instructed how to make the necessary quantitative tests. He made them with great care, and as I had the opportunity of checking them from time to time, I believe them to be quite accurate.

The previous treatment had already caused considerable improvement in her general health, and the loss of weight had not continued, her weight being now 9 st. 2 lbs. Before using the uranium it was decided to have analyses of the urine made for two or three weeks, so as to be able to compare the results before and after the administration of the drug. These are shown on Chart V. It will be seen that the quantity of urine averaged about 1625 c.cm., the specific gravity 1034, the percentage of sugar about 2.4. In the lower part of the table the total amount of sugar passed per diem is shown: it averaged about 35 gra., varying considerably, as did also the quantity from day to day.

At the end of November uranium nitrate was commenced in small doses. One grain was given at first twice a day, and then, a little later, three times a day. After taking these small doses for a short time the effect showed itself in the beginning of December, first upon the quantity of the urine, which fell considerably. Subsequently, as the dose was increased, the percentage fell also. It was about three weeks from the commencement of the treatment that the percentage began to fall, and with each increase in the medicine the percentage fell further, till after taking 2 gra. three times a day for a week or ten days the percentage was under 1. Then 3½ gra. three times a day were given, and the percentage fell further, to ½. Four gra. were then given, and on January 22nd the sugar disappeared from the urine entirely. At this time the average amount of urine was 1300 c.cm. instead of 1625, and the specific gravity 1018 instead of 1034.

From this date the sugar remained entirely absent, except on four odd days, until the end of April. The highest amount of sugar present in the urine on these odd days was 0.37 per cent. During May, June, and July occasional traces

were present, though on most examinations no sugar was found at all; but even when this small amount was found, it usually was less than ½ per cent., and the highest record was only 0.7 per cent. During all this time 3½ gra. of uranium nitrate were being given three times a day.

Chart V.—Case of diabetes treated with uranium nitrate after having been for some time previously strictly dieted.

In September, though still taking the uranium nitrate, the percentage rose, the quantity of urine was also increased, and averaged about 1,500 c.cm., the specific gravity being about 1020, and sometimes higher. At the same time considerable fluctuations were noticed, both in the quantity, the specific gravity, and the percentage of sugar. This relapse was partly, I believe, due to experiments in diet, but was also to a great extent the consequence of the worry of house hunting and of removing, and of irregularities in meal times and diet which were unavoidable at this time. Probably if I had seen her then I should have advised an increase in the amount of uranium taken.

In February Mrs. W. was attacked by influenza. There was a good deal of fever, and altogether it was a severe attack. She was very ill, had great pain in her head and limbs, slept badly, lost her appetite almost entirely, and became very much thinner and weaker. The quantity of urine, specific gravity, and the percentage of sugar all rose immediately as the table shows, the quantity of urine reaching on several occasions 1,500 to 2,000 c.cm., and the percentage being about 2, and occasionally reaching 3. The uranium was suspended then, and I understand has never been resumed. As the influenza passed off the percentage fell, but still continued well over 1, averaging perhaps 1.2; the quantity of urine also was greatly increased, averaging between 1,500 and 1,900 c.cm.

In April she was still ailing, very feeble, and continuing to lose flesh; the percentage of sugar was 2, specific gravity 1030, the average quantity about 2,000 c.cm. Soon after this she went away to Ireland, where she got better, but was not able to diet herself so strictly as she would have done at home; still she improved. On her return home in May she was still thin, looked feeble, and the percentage of sugar remained much as before. She has since then still further improved in general health, but the conditions in the urine remain very much as they were, the daily percentage of sugar being about 2 and the quantity of urine about 2,000 c.cm. In fact, as her husband says, she seems at this time to be in much the same condition as she was two years ago, when the treatment with uranium was commenced. I advised that the uranium nitrate should be resumed, but some little objection was felt to that by the patient, because she thought it upset her digestion, for during the time that she took the

drug she used about every month or so to have an attack of gastric indigestion, and the bowels became somewhat relaxed. She attributed this disturbance to the medicine, but there is no actual proof that it was the effect of it. She also thought that the medicine caused her to lose weight, but that might have been, and very likely was, merely the effect of the disease, and not of the drug. At any rate it was not much, for after taking the medicine for seven months her weight was 84 lbs., having been previously 94 lbs. 2 lbs.

It has been at present agreed that she should continue on her present line, without medicine, dieting herself strictly, and living a healthy out-of-door life as far as possible. If the improvement does not continue, no doubt the medicine will be resumed.

The chief point of difference between this case and the preceding one is that small doses of uranium not exceeding 4 grs. had a marked effect, though in the first case much larger doses were given, and appeared to be necessary. Still, it is quite possible that when the effect is once produced it can be maintained by small doses, and I am inclined to think that though the drug takes longer to act when given in small quantities, its effect does not depend entirely upon the amount administered each day, but that in some respects, though taking longer to act, the small doses may have almost as efficient an action as the larger ones.

Chittenden observed that the prolonged administration of uranium was followed by the presence of albumen in the

Chart VI.—same case, showing relapse caused (1) by worry, (2) by influenza, and return to early condition when uranium was given up, both the amount of urine and the percentage of sugar being disturbed.

urine consequent upon an irritant and destructive action on the renal epithelium. It is important to state in respect of these observations that albumen did not appear at any time in the urine in either of these cases, nor have I ever observed it in the other cases I have treated with uranium. Possibly this may be due to the gradual administration of the drug. If so, this is quite in accord with Chittenden's further statements that if the albuminuria produced by a certain dosage was allowed to disappear by suspension of the drug, the drug could then be given again, and increased even to ten times the original amount before albumen again appeared. This would appear to point to the necessity of giving the drug as I did in these cases in small amounts at first, and increasing them gradually.

CASE III.—The third case is that of E. R., a woman, aged 38, an inpatient of St. Bartholomew's Hospital, who had been treated in the ordinary way for diabetes for many weeks before she was placed upon uranium. She had had carefully restricted diet, and cod-liver oil had been administered in the usual way. Even upon this treatment the quantity of urine averaged about 6 pints, the specific gravity between 1035 and 1040, and the percentage of sugar was 7. Five grains of uranium nitrate
